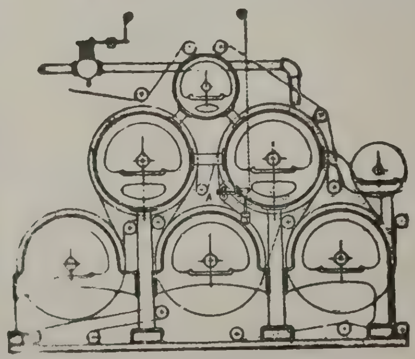
THE PICKLES DRYING REGULATOR



Reasons why you should have it on your machine are: First, it regulates the drying of paper automatically, irregularities are eliminated; second, higher machine finished papers are attainable, because it is possible to maintain the proper quantity of moisture in sheet, as it passes to calenders; third, mills having tried it on one machine have ordered it for all their machines. Full particulars upon application to

ORR FELTS and JACKETS

Lowest Cost per Ton

If you judge felt values, not by what you put into the equipment, but what you get out of it—then you will specify ORR 3 stripe Endless Felts for ORR felts will produce the lowest cost per ton. They "stand up" under severe usage. Orr durability is acknowledged everywhere. Their strength and long life are as dependable as their reliability and quality.

In the 32 grades of Felts and Jackets we can match your most exacting demands. Tell us the kind of paper you desire to make, and we will send you samples of felts that will economically serve you and help you to produce paper at lowest cost per ton.

Volume XXXIII, No. 13 PAPER January 17, 1924

The Magazine of the Paper Industry

THOMAS J. KEENAN, F.C.S., Technical Editor RUSSELL C. HUGHES, Publisher

IN ALL FRANKNESS

IT is time for PAPER to speak frankly about itself. The Hughes Publishing Company bought the magazine, PAPER, because the men who compose that company felt it was a good business investment, and because they like the paper industry and the people who compose it. In our contact as publishers with people in the paper trade we have found them to be fine, intelligent, friendly.

Moreover, an investigation of the magazine PAPER revealed that although its advertising business was not large at the time, it had an amazingly substantial list of paid subscribers. Through all the business vicissitudes reader interest had never been lost, and it was plain through this one fact alone that the people in the paper industry wanted PAPER. And as long as that interest was there, we didn't care a whoop whether the property was paying or not at the time, for we knew that upon that reader interest could be built a firm, growing, worthy business.

So we bought PAPER. And buying it we entered the field to stay.

As any publication never amounts to shucks unless it has infinite personal attention, we are here to give it that personal attention. We too are here to stay. We are going to try to inject a spirit and an individuality into it that will re-establish it as the leading paper trade magazine and furthermore as the really representative magazine of the paper industry.

We have the utmost confidence in it. Whether it carries many advertisements in the next few weeks and months is entirely immaterial to us. We know that if we build a good, honestly worthwhile journal, if we earn the support of the paper industry, the readers of which we already have in large numbers, the advertising will follow.

True it is that the industry is not in a mad flush of money-making just now. But those institutions that are permanent must take the bad with the good, must suffer or rejoice sincerely with the industry they represent. And we didn't enter the industry to skim any cream or get rich quick.

As a first step we have gathered back into the fold Tom Keenan to make the technical side of the paper sparkle with life. Do you know, we marvel at that man's knowledge of the paper business?

But he is only one good thing we have in view. They will speak for themselves. All we ask is your help, your suggestions, your kicks, honestly spoken. We want your confidence, your good-will, your friendship.

We want you to give us a chance and we want you to tell your friends to give us a chance—to make good.

RUSSELL C. HUGHES,
Publisher.

Fiber Board Manufacture

Character of Raw Material Used in Making Leather Substitute—Technical Details of Sorting and Cooking—Beating Process Determines Quality of Product as with Fine Papers—Fiber Board is Sized with Rosin and Colored with Pigments, Ochers and Oxides

By RAYMOND H. HARDING
Chemical Engineer
*Rogers Fibre Company, National Division,
Bar Mills, Maine*

SEVERAL grades of fiber board are manufactured and sold for different purposes. Some 57 per cent of the fiber board in use is made from chips, the name given to a composite of old papers, low grade and refuse materials from pulp mills, screenings and waste of other kinds repulped. Straw, ordinary farm straw, is used as raw material for 22 per cent of commercial fiber board, while 16 per cent has its origin in woodpulp of rather low grade and short fibered, to which is added a small quantity of long-fibered pulp to give the required strength. The remaining 5 per cent is made from jute. (Old rope and bagging.)

Fiber Board Used as a Substitute for Leather

THE better grades of fiber board used as a substitute for leather comes more or less under the last named class—the 5 per cent made from jute —being, jute, hemp, flax and strong sulphate pulp, with sometimes a small proportion of sulphite screenings added to act as a filling material.

Nothing in the manufacture of fiber board for use as a substitute for leather has appeared in the technical literature for a number of years. The accompanying article by Mr. Harding of the Rogers Fibre Company will accordingly attract the interested attention of all board manufacturers. The intimate details which are given concerning the sorting and cooking of the stock and the subsequent washing and beating are of great suggestive value. The modern conception of beater action in the hydration of pulp is clearly set forth and much information of value is given concerning the function of hydration.

The basic material, which is jute, hemp and manila, is usually received at the mill in the form of mixed strings, carpet strings, etc. Flax is received as carding waste and sweepings, and is graded according to the fineness of fiber and amount of dirt contained. Sulphate pulp is received n bundles, or bales, and usually in the dry sheet form familiar to all. Sulphite screenings are received in aps as they come from the wet machines of the mills and may contain as high as 60 per cent of water.

The mixed strings and flax are cut nto suitable lengths for cooking in heavy duty rag cutters, consisting of a cutter head, to which knives are firmy attached, revolving against a bed knife. A separately driven drum tudded with teeth feeds the material o the revolving knives. The length of the cut is determined by the ratio between the speed of he cutter head and the speed of the feeding drum, and may be changed at will by means of the cone pulleys driving he drum.

Owing to the length of the strings and the firmness with which they are intertwined, railroad and similar dusters re impractical. Therefore dusting is an operation following the cutting rather than preceding it, as is the case n handling rags and other like material. The dusting is ccomplished by means of blowers and collectors. The material is taken direct from the cutters into a fan and lown up into a collector. The fibers, having a specific gravity greater than dust particles in the dispersed state settle as the velocity is reduced in the collector and are delivered to the rotary boilers. Particles of metal and heavy dirt being of still greater specific gravity are delivered at the extreme bottom of the collector and are disposed of through a chute for that purpose.

How the Material is Cooked

THE cooking, which is necessary to reduce the grease and incrusting materials to such a state that they may be easily removed by the subsequent washing process, is carried out in boilers of steel plate, either of the cylindrical or spherical type. The usual size of these boilers is 8x24 ft., holding 4,000 lb. to 5,000 lb., depending on the material. These boilers are equipped with hollow trunions for the admission of steam for heating purposes. The interior usually has projecting spikes to keep the material from matting, or balling, during the cooking process, which would result in undercooked portions. This class of stock is usually cooked with lime and soda ash at a comparatively low temperature. The boiler is filled as full as possible as the material is bulky and hard to pack. If water is allowed to run into the boiler at intervals during the filling it will aid in packing and larger cooks will result. The lime and soda ash can be added either in the dry state or dissolved. More uniform results will be obtained if the lime and soda ash are dissolved before being added to the rotary. Also there will be less liability of burned spots and undercooked spots in the stock caused by high concentrations of the liquor in some places and low concentrations in other places. If the lime and soda ash are dissolved, the solution can be added with the water at the time of charging the boiler.

If warm water is added to the boiler the time required to bring it to the required temperature will be lessened and the cook can be made in shorter time. There will also be a saving in the steam required. Unless, however, there is a supply of waste heat available for this purpose, it is doubtful if preheating the water is a paying proposition. Higher concentrations of alkali and higher temperatures can be employed to shorten the cooking time but only at a sacrifice in the strength of the resulting stock. Temperature, time of cooking, and amount of alkali added being constant, the strength of the resulting stock will vary inversely with the concentration of the alkali, i.e, grains per liter. For this reason care should be taken regarding the amount of water added. This can be most easily provided by means of a water meter; filling the boiler to a certain level is not a correct indication of the amount added owing to the different absorbing qualities of different stocks. In figuring the amount of water required for a given concentration, allowance should be made for the condensation of steam resulting from bringing the boiler up to temperature.

The pressure is usually relieved and the boiler drained before removing the stock. If the boiler be blown under pressure a larger amount of dirt will be carried away, but the resulting stock loss more than offsets this. The stock from the boiler is drained either on the floor directly beneath the boiler or in pits with porous bottoms.

Washing the Stock

FOLLOWING the cooking comes the washing of the stock. This is usually carried out in a regular hollander beating engine equipped with one or more washing cylinders. Fresh water is continually added to the engine and thoroughly mixed with the stock by the action of the beater roll. The washing cylinder, or cylinders, continually remove dirty water laden with dissolved impurities. Sand catches are placed in front of the roll to catch particles of metal, dirt, etc., which are heavy enough to sink through the stock and too large to go through the washing cylinder wire. Washing must not only be carried far enough to remove the required amount of dirt but every trace of the cooking liquor must be washed out as if it is allowed to remain it will kill the size and alum used in subsequent operations.

The beater roll is lowered during the washing process enough to break up the bundles of fibers and free the encrusting materials, but not enough to produce any beating action as this would beat the dirt into the fibers and render clean washing impossible. It is rather a point of contention as to how far the breaking action can be carried without driving the dirt into the fiber. It is, of course, policy to bring the roll down as fast as possible during the washing process as this shortens the subsequent beating time. However, care must be taken not to go too far or a dirty stock will result.

Beating is a continuation of the washing process and is carried out in the same engine; the washing cylinders being raised out of the stock and ceasing to function. Owing to the necessary inequalities caused by the great variation in raw material—a bale of mixed strings never containing exactly the same proportions of jute and manila, and being too intimately mixed for sorting—small units are preferable to larger ones.

The well known saying that "paper is made in the beater" applies even more closely to high grade fiber board than to fine papers. As will be seen later on in this article there is very little control over the stuff on the machine, as compared with a fourdrinier machine, and the stock must therefore be prepared with even greater care than ordinarily is the case. The fact that the stock is seldom jordaned or screened makes uniform beating still more important. Small units aid in keeping the stock furnished to the machine of a uniform quality; heavy beaters can be balanced by light ones, too short fibers can be offset by dropping a slightly long fibered beater; stock too "slow" can be remedied by a "free" beater. With larger units, unless the chests held a great number of hours supply for the machine, this would be impossible. Chests of such a capacity would be unwieldy.

Beating Requirements

THE several grades of fiber board require different treatment in the beater. For a tough flexible board with good bending qualities a long, fine, well drawn out, and moderately well hydrated fiber is necessary. When board of a greater density is required and where the bending quality can be sacrificed a somewhat shorter fiber, more hydrated can be used.

The beater has three different actions on the fibers:

(a) A straight cutting action.
(b) A crushing and brushing action.
(c) A hydration action.

(By hydration is meant the adsorption of water by the fibers.)

There is a definite relation between actions (b) and (c). A fiber that is crushed and brushed out at the ends will adsorb water more freely than one which is cleanly cut. Therefore we can group actions (b) and (c) under one heading, hydration.

The ratio of the cutting action of the beater to the hydrating action depends on the following factors:

1. Consistency of the furnish.
2. Design and condition of the beating tackle.
3. Weight of the beater roll.
4. Speed of circulation.
5. Position of the roll.
6. Time of beating.
7. Temperature of beating.

Control of Consistency in the Beater

THE consistency of the furnish influences the ratio o cutting to hydrating in that the greater the consistenc the greater the pressure of the fiber against fiber. Thi pressure causes a rubbing action which accelerates hydra tion. However this increased pressure also causes the beate to heat and heat retards hydration. There is, therefore, point where the heating of the stock may offset the hydrat ing effect of the increased pressure and perhaps go so fa as to "free" the stock somewhat.

A sharp tackle cuts, a dull tackle hydrates. Roughly th greater the number of bars in the bed plate the greater wi be the hydrating action. In order to maintain a definit ratio between cutting and hydrating (and this is necessar to secure even stock) the tackle must be kept in conditio The use of maganese steel for bars and plates will accon plish a great deal in this line, as maganese steel resis wear to such an extent that the same cutting surface is pr sented day after day.

The weight of the roll has a definite bearing on th ratio of cutting to hydration. The heavier the roll th greater will be the crushing action, and as crushed fibe are more easily hydrated than cut fibers, the greater w be the hydration.

If the consistency is kept constant (assuming a consta beater line speed) the speed of circulation will be constar Increased speed of circulation has no appreciable effect the ratio between cutting and hydration, nearly acceleratir both in equal proportions.

In handling the roll the first two hours are probably t most important. If the roll is put down too fast on t fiber it will be weakened to such an extent that the resulti board will be soft and raggy even though the fibers m retain their length. A roll gradually lowered brushes t fibers out and allows hydration to proceed to a greater e tent than cutting. The above applies to a light roll. heavy roll lowered quickly will cut faster than hydrati can proceed. This question of the position of the roll directly in control of the beater man who must use judgment coupled with his knowledge of the requiremer of the stock. No two beaters on rope stock will han exactly alike and experience in this position is a big fact

All other conditions being equal, hydration is a dir function of the time of beating.

Use of Green's Freeness Tester

HYDRATION is also a function of the temperature beating; an inverse function. Measured by a "slown and freeness tester" similar to the one constructed by A. Green, a furnish consisting of 80 per cent mixed stri and 20 per cent strong kraft pulp gave the following average readings at different temperatures:

Degrees Fahrenheit		Cubic Centimeters
60	=	170
50	=	162
40	=	152
32	=	146
70	=	185
80	=	206

On these tests factors 1, 2, 3, 4, 5 and 6 were held as constant as possible. From these it will be seen that hydration proceeds faster in the cold.

This fact accounts for the difficulties encountered in the winter months in keeping the board from being too hard and brittle. There is a variation of from 25° to 35° Fahr. in the water temperature between summer and winter where the mill supply is taken from ponds or rivers. This change in temperature has a very decided effect on the degree of hydration and unless beating conditions are changed hard board is bound to result in the winter. There are two ways to overcome this excessive hydration in the colder months, namely, (1) lighter beating; (2) heating the stock in the beaters. As it costs approximately 80 cents to heat a 750 lb. beater of stock at 5 per cent consistency from 32° Fahr. to 60° Fahr. it would seem that the first method is to be preferred.

Sizing and Coloring

FIBER board is usually sized with rosin. Either prepared or mill made size may be used, the amount required depending on the exact use to which the board is to be put. When alum is added the size is thrown down in a flocculent precipitate. These particles are held fast in the fibers of "slow" stuff but in "free" stuff they filter through and may be deposited on the machine felts causing "packing." It seems plausible then that a "slow" stuff will be more easily sized than a "free" stuff and such has been found to be the case. Thus it is apparent that the degree of hydration has a direct relation to the sizing of the board, again showing the extreme importance of the beating operation. It is more difficult to size fiber board than it is to size paper. It is a well known fact that thin paper is more difficult to size than a heavy paper, and fiber board is made up of a great number of thin layers. As a sheet of paper comes in contact with the hot surface of the driers the small particles of size are melted, cementing the mass together and closing the pores. As fiber board is loft dried this melting of the particles is not possible. It nearly always follows, therefore, that fiber board requires more size than paper to produce an equal resistance to ink, etc.

Fiber board is nearly always colored with pigments like oxides and ochres, which also act to some extent as fillers. These colors must be fine and free from grit as the fiber board is usually cut up into small shapes in conversion and grit would dull the tools used in these processes. As a rule no alum is required to fix these colors on the fiber as they color the stock by becoming enmeshed with the fibers in the beater. The size and alum assist in retaining the pigments to some extent. Pigments do not penetrate into the central canal of the fiber as do the dyes, and there seems to be no chemical action involved except colloidal adsorption, perhaps. The retention of the pigment, and therefore the depth of color imparted to the fiber, depends on the nature of the stock, the density of the pigment, and the amount of size and alum used. "Slow" stock will give a higher retention than "free" stock. As pigments also act as fillers the use of too great a quantity will weaken the board, and where extremely deep shades are required the pigments are strengthened or entirely replaced by anilines.

The chests required for the manufacture of fiber board differ in no respect from those in any paper or board mill. For the sake of uniform stock the chests are made of sufficient size to hold a larger number of beaters than usual. As accumulated, "dead" stock sours quickly the chests should be placed where they are free of access and can be easily cleaned.

Forming the Board on the Cylinder

THE machine used for running fiber board consists of a single cylinder (or mould), covered with wire mesh, similar to a fourdrinier wire, and rotating in a vat of stock in which it is nearly immersed. As this wire covered cylinder (or mould) revolves in the vat the stock tends to flow through the wire covering into the hollow interior. The fibers, being unable to pass through the fine meshes of the wire covering, are caught on the exterior in a thin web. The water that passes through is drained out at one end of the cylinder. The difference in level between the stock in the vat and the water which has drained through to the inside of the cylinder produces a slight suction which holds the film of fibers against the cylinder as it moves around. The cylinder revolves against a head of the same size. Around the cylinder and head is a band, tight enough to secure the suction which is provided by the difference in levels between the outside and inside of the cylinder, but not tight enough to cause undue friction to the rotation of the mould. The amount of suction produced is controlled by the difference in levels between the stock on the outside of the cylinder and the water on the inside. This difference in levels is in turn adjusted by a gate controlling the opening through which the water which has drained through the cylinder escapes. The amount of suction controls the thickness of the web of fibers which forms on the cylinder.

With a machine operating in this manner the fibers are naturally drawn toward the cylinder at right angles to it by the suction produced by the difference in levels. Fibers thus drawn against the cylinders at right angles to it would not felt properly and would cause a poorly built up sheet. To overcome this tendency of the fibers to approach the cylinder at right angles various attachments are used to cause them to approach the cylinder in a position parallel to it, or in a similar relation to the cylinder that the fibers bear to a fourdrinier wire as they flow on to it.

Resting on the top of the cylinder is a couch roll with a felt running over it in the same direction that the cylinder is traveling. This felt picks up the web of fibers from the cylinder and carries it to the press rolls. At the press the web is allowed to transfer itself to the top press roll, around which it winds in succeeding layers until the desired thickness of board, measured in the wet state, is obtained. The board is then cut from the press roll without interrupting the operation of the machine, and the felt returns around the bottom press roll, to be showered, whipped free from adhering fibers, squeezed dry and returned to the couch roll.

Particular care should be taken in the design of the wet machine frames and the housings which support the press rolls. These should be heavy enough to withstand any sudden shock to which they may be subjected by the passage of lumps through them. Heavy frame construction eliminates to a great extent the vibration, caused in part by the whipper, which causes so much trouble in machines of light construction. The cylinder mould should be supported by overhanging bearings of rigid construction; when supported in this manner sagging is reduced and the resulting troubles eliminated to a considerable extent.

Delivering Stock to the Vat

THE stock cannot be rushed into the vat under pressure as this causes "boiling" and the sheet will be uneven and streaky owing to uneven consistency of the stock. To avoid this condition the head box must be so designed as to deliver stock to the cylinder vat absolutely free from currents and eddies. This is usually accomplished by dividing the head box into four or more compartments by means of partitions or baffles. The stock enters the head box from the mixing box, or mixing pump, flows under the first partition, over the second, under the third partition and over the fourth into the vat with very little momentum.

Provision is made for quick emptying of the head box, usually by wooden plugs with iron rods extending high enough to reach the top of the box. There are various patent gates and values for quick emptying of the head box, but the plug and hole remains entirely sufficient and satisfactory. An overflow should be provided from the head box to the mixing box to take care of sudden rushes of stock. All corners should be rounded to prevent lodgment of stock and a constant spray kept over the partitions to kill foam and bubbles.

Necessity of Properly Crowned Press Rolls

UNIFORM drying depends upon properly crowned press rolls. If the press rolls are not properly crowned the board will be wetter in the center than at the ends, owing to the deflection of the roll by the weights at each end. For a roll of given length the crown will vary according to the diameter of the roll and the thickness of the walls, or weight of the roll.

The nearer the circle of the vat to the mould the more dense or closely knit will be the board; the thinner the web of stock on the mould the denser the resulting board will be. The web must however, be maintained of sufficient thickness to cover the felt, if the felt is not covered weak spots will develop in the finished board. Sometimes it will be found impossible to cover the felt without running the web at a thickness all out of reason. An examination of the mould will usually reveal dirt spots as the cause of this difficutly.

Slice boards tied down too tight will cause fine checks thereby weakening the board considerably.

Lagging idler rolls will cause the felt to stretch more in some places than others. This has a tendency to pull the fibers apart and cause weak spots.

Quality of Felts

FELTS should be of good quality and somewhat open to allow the rapid removal of water and to permit ready removal of short, adhering fibers at whipper and showers. Finely woven felts make a denser board and one having a smoother surface, but a felt of this kind will fill up more quickly and is liable to mark the sheet. These finer felts are also harder to clean at the showers, and it is well known that a dirty felt is one of the causes of uneven drying. The regulation of the tension on the cylinder felt has a definite relation to the life of the felt; the felt should be allowed to run as loose as possible without sagging. The abrasive action of the whipper is exceedingly detrimental to the felt—the whipper should be so adjusted that there will be a maximum clearing action with a minimum abrasive action.

Drying Process of Great Importance

NEXT to the beating process the drying of fiber board is the most important process in its manufacture. All fiber board used as a substitute for leather is loft dried and this is a process that cannot be hurried; the water must be removed slowly from the stock to prevent brittleness. Too much heat causes the outside of the board to dry first, and the inside being wet cockles appear on the surface as round slimy spots after calendering. Some boards can be dried faster than others. The speed of drying depends to some extent on the use to which the board is to be put. Tough, flexible board requires slower drying than a hard, less flexible board.

The board going to the dry room from the machines contains approximately 66 per cent of water. This means that two pounds of water must be removed in the dry room for every pound finished. For every ten tons of board finished 20 tons or 40,000 lb. of water must be removed, and removed slowly.

Air at a definite temperature has a definite moisture-carrying capacity. This moisture-carrying capacity increases rapidly as the temperature increases. The volume of water to be removed is a constant, a certain volume of air per minute at a definite temperature, will remove this water in a given time. The speed of drying can be governed therefore by the amount and temperature of the air admitted to the dry room. Methods must be devised to insure an even circulation and removal of the air in the dry room otherwise there will be pockets where the drying will proceed faster or slower than in the remainder of the room.

Fiber board is calendered in single nip stacks either once or twice through, and hot or cold, according to the finish desired. One of the principal difficulties experienced in the calender room is a lack of uniform finish caused by different amounts of moisture contained in the board. Board exposed to warm humid air in summer may contain as high as 10 per cent of moisture, making it very hard to secure a firm product. In winter cold air containing very little moisture is taken from outside the plant and heated so that it is capable of carrying off large quantities of moisture, and the same board that contained as high as 10 per cent of moisture in the summer may, under these conditions contain as little as 3 per cent of moisture. This board, with the same calender treatment as a board containing 10 per cent moisture will be hard and brittle. A remedy for this condition would be to install a ventilating system which would always furnish air at a given humidity and temperature to the finishing room.

A Portland, Oregon newspaper in a recent issue contained a picture of the Portland Pulp and Paper Company's new ten-building plant made from the architect's plans. The building will be commenced early in the spring and will require approximately a year to get the work finished. It will be of modern concrete and re-inforced steel construction and is to be equipped with modern machinery for the manufacture of kraft paper. Slabwood lumber from the Monarch Mill will be used to make the kraft paper. A special process will be used to get rid of the pitch in the wood.

The English China Clay Industry

Extent of Development Portrayed in Photographs and Figures—Cornwall and Devon Chief Producing Centres

By S. P. BUNN, *St. Austell, Cornwall*

THE English china clay industry of Cornwall and Devon is peculiarly interesting to the papermaking industry of America and Canada, inasmuch as the bulk of the china clay imported is used as a coating and filling material in book and magazine paper. America may be said to be the home of the coated paper industry, for the adaptability of china clay for this purpose was first discovered there in 1875, since when the development and improvement of paper coating machines in the paper mills of America and Canada have revolutionized the coated paper industry and transformed it into a fine art.

Near view of newly opened clay pit showing men with "shivers" at work

How Imports Have Grown

As showing to what an extent the demand for English china clays has grown, in 1875 the total imported for the year was 130 English tons. In subsequent periods it grew to 7,823 tons in 1880; 10,626 tons in 1885; 27,137 tons in 1890; 70,585 tons in 1895; 104,833 tons in 1900; 231,234 tons in 1910; and 320,217 tons in 1914.

Since then the imports have fluctuated below this figure, the best after-way year having been 1920, when nearly 318,000 tons were taken. The quantities taken by Canada direct have been very much less, seldom having exceeded 12,000 tons in the year.

Taking the English china clay industry as a whole, it reached its zenith in 1912, when the total delivered to the home and overseas markets nearly reached one million tons. Since then the highest totals have been, 895,250 tons in 1914, and 864,500 tons in 1920.

Cornwall and Devon Chief Sources

The bulk of the china clay produced in Cornwall and Devon, the latter county producing only one-tenth of the total, is used in the papermaking industry, none of the koalins produced in any other country possessing in such a high degree the attributes specially suitable for use in papermaking. Amongst the other main uses of china clay are pottery, cotton goods, and chemicals.

Pump shaft leading to underground level at bottom of pit. The liquid clay is pumped out by a suction pump, with power furnished by gas plant in house adjoining

How the Clay Is Mined

The secret of the success of the English china clay industry has been the proximity of the china clay mines to the seaboard, and to the existence of a bountiful supply of water essential in the refining process. English china clay is found in its virgin state mixed with quartz, the extraction of which is secured by means of water, the clay being washed in a liquid state to the base of the pit, where it runs into a level from which it is pumped up through the shaft connecting the level to the surface. Here it runs over hundreds of feet of refining troughs, known as "micas", so named because the coarse, micaceous material is left behind in the troughs, while the liquid clay runs on in

Rear view of kiln showing tanks containing wet clay ready for drying as in all modern "layouts"

"Micas" or refining troughs (on left) over which liquid clay is run and in which the coarse particles fall, while the refined clay flows on to settling pits seen on the right.

suspension to settling tanks. From the settling tanks the clay is piped down to the elongated kilns, which are invariably situated alongside railway sidings or ports, located many miles from the works where the clay is raised.

The clay enters huge tanks adjoining the kilns, where it remains to settle for several weeks, after which the water is drained off, and the wet clay, of a glutinous consistency, is "trammed" onto the pan of the kiln. Here it remains from twelve hours to two days, depending on how near to the furnace end the clay is placed on the pan, and is then cut up into suitable sizes for handling and thrown into a linhay, or store, ready for shipment.

Change in Form of Package

Before the war a large proportion of the china clay shipped to America was sent in casks, but in consequence of the prices to which casks rose during the war, the American market now takes most of its china clay in bulk, a large proportion of the remainder being dispatched in bags, the contents weighing 224 pounds or 2 cwt.

Until fifteen years or so ago, the shipment of china clay from Fowey, the port of shipment for most of the export trade, was done through small steamers for transhipment at Liverpool or Bristol, but since the quick-loading electrical apparatus was installed at one of the jetties, it is now taken by large oceangoing steamers from Fowey direct to American ports. A further advance has recently been made in the accommodation and quick-loading apparatus at Fowey by the recent opening of the new jetty and the deepening of the estuary, so as to permit of the ingress and egress of large steamers at all states of the tide. Fowey can therefore now lay claim to possessing all the facilities for quick loading such as are possessed by larger British ports, and has the reputation of being the cheapest loading port in the United Kingdom.

List the Approved Chemists

Work of a joint committee representing the American Paper and Pulp Association, the Technical Association of the Pulp and Paper Industry, and the Association of American Wood Pulp Importers for the listing of approved chemists for weighing, sampling and testing pulp has progressed so far that the various forms for use in this work have been completed. A detailed statement of experience and qualifications is prepared for the chemists who wish to be rated as approved chemists for the joint committee, and a set of instructions for the chemists to follow in making tests has been completed. The chemists must also be approved by the Scandinavian wood pulp associations, and the specifications for testing are so complete that it is believed that there will be a great reduction, if not an entire elimination of difficulty due to questions of quality.

Buying Foreign Bleaching Sulphite

Some of the New England paper mills have been purchasing considerable foreign easy bleaching sulphite in spite of the fact that their own pulp mills were not being operated at full capacity. This has been largely the Scandinavian sulphite, which would indicate that paper manufacturers can buy foreign pulp to better advantage than they can manufacture their own. The majority of the New England manufacturers of machine finish book, coated book and sulphite bonds, however, have used the domestic supply of pulp and have paid the slightly higher prices for the same in order to maintain a higher quality of product.

Prices of sulphite, f. o. b. domestic mill or dock are quoted as follows: domestic bleached sulphite, $3.80 to $4.50; foreign bleached sulphite, $3.75 to $4.30; foreign unbleached sulphite $2.60 to $2.80; kraft pulp $2.40 to $2.85; soda pulp $3.50 to $3.80; ground wood pulp, per ton, $38.00 to $42.00.

Take Handsome New Office

Hollingsworth & Vose Company, 141 Milk Street, Boston, where they have been located for many years, have leased the eighth floor of the new Province Building at 333 Washington Street, Boston, and during the past week moved into their new quarters. The new quarters are in one of Boston's newest and most up to date office buildings. It is in the heart of the business district of the city. The company will have about 4500 additional feet of floor space in its new quarters in addition to more light and better arrangement of its offices and accounting rooms. The company manufactures paper at its mills at East Walpole, Mass., and West Groton, Mass.

Notes of the New York Trade

CASTLE & OVERTON, of 200 Fifth Avenue, New York, among the oldest and best known concerns in the papermakers' supplies trade, have incorporated under New York State laws with 4,000 shares of preferred capital stock of $100 par value and 1,000 shares of common stock of no par value. William A. Castle, Frank C. Overton and Carleton B. Overton were the incorporators. Mr. Castle is president and treasurer of the new corporation, Mr. Frank C. Overton is vice president, and Mr. Carleton Overton is secretary.

A. H. Searle has opened an office at 132 Nassau street, New York, where he will carry on a general business in paper mill supplies, and represent the interests in the United States of G. Wallace & Co., Dundee, Scotland; Mayer Bros., of Hanover, Germany, and I. & J. Hyman, of London, England, exporters of papermaking rags and other materials.

The Reading Paper Mills, of Reading, Pa., manufacturers of high-grade rag papers, have opened a New York sales office in Room 1126 of the Canadian Pacific Building, 342 Madison Avenue, with Edwin D. Peck in charge. Mr. Peck has had many years' experience selling paper in the metropolitan territory, and he will endeavor to make the Reading lines more popular in this city than heretofore. The Reading Mills have been producing fine rag papers for 50 years but this is the first time they have been represented directly in New York City.

Johaneson, Wales and Sparre, Inc., wood pulp agents and importers of 16 East Forty-first Street, New York, announce that they have been assured of close co-operation from several New York State paper mills and as a result have opened a paper department under the direction of J. R. Newton, who is in intimate touch with each one of these mills and who will aim to give the best service possible to the firm's customers.

A new paper concern in New York has been organized by the consolidation of Blake & Decker, Inc., formerly at 50 East Eleventh Street, and the New York house of Dill & Collins Company at 419-421 Lafayette Street, the name of the new firm being Marquardt, Blake & Decker, Inc., notice of the change in name having been filed with the Secretary of State at Albany, and also notice of an increase in capital stock from $75,000 to $150,000. Oswald F. Marquardt is president and general manager of the new company, Bertram T. Blake is vice president, and Randall H. Decker is secretary and treasurer. Mr. Marquardt has been manager of the local Dill & Collins branch for some years, and Messrs. Blake & Decker were associated with the same company before starting in business for themselves in 1918. The new concern will occupy the quarters on Lafayette Street, where all the lines hitherto carried by the two former companies will be stocked.

The Publicity Paper Corporation, paper importers and merchants, has moved from 1476 Broadway to 406 West Thirty-first Street, New York. The new telephone call is Chickering 7755.

Maurice London, secretary of the Lagerloef Trading Company, Inc., wood pulp importers of 52 Vanderbilt Avenue, New York, sailed a few days ago on a business trip to Europe.

John J. Spinnelli has severed his connection with Atterbury & McKelvey, Inc., of 145 Nassau Street, New York, and has opened an office in Room 1607 of the Park Row Building, 15 Park Row, New York, to handle all classes of papermaking materials. Mr. Spinnelli has been in the paper stock trade for 30 years and is thoroughly conversant with the wants of paper and board mills, and in close touch with packers of rags, waste paper and similar materials.

Jacob Erichsen and Johannes Westergaard, well known in the local wood pulp trade, are now associated with Atterbury & McKelvey, Inc., pulp importers and dealers of 145 Nassau Street, New York, which firm has just been appointed sole agent in the United States for A. S. Tofte Cellulosefabrik, of Christiania, Norway, manufacturers of bleached sulphite.

Joseph F. Keene, of Katzenstein & Keene, Inc., importers of papermaking raw materials of 200 Fifth Avenue, New York, recently returned from a two months' business trip to Europe, and reports that he found stocks of rags on the other side of the Atlantic at an unusually low level.

C. A. Wadsworth, who has been connected for several years with H. B. Wadsworth has resigned from H. B. Wadsworth, Inc., of 51 East Forty-second Street, New York, and has opened his own office for the sale of wood pulp, paper and a general line of paper mill supplies at 342 Madison Avenue, New York.

The Editorial Page

KEEP ON THE WARPATH

THE American Paper and Pulp Association should keep up a steady, consistent, unremitting campaign to curb the dumping of pulp and paper in the American market at ruinous prices. The evil is apparently not growing less.

The entire industry can't get away from it. America is not Germany or Sweden or Norway. With the proud position of America's money and America's labor, this nation cannot successfully compete with paper imports from abroad under the present tariff law. Then when upon the top of this general condition there is added the suspicion of dumping, the battle should go on.

It is obviously impossible for the American Paper and Pulp Association or any association to cause a sudden change in the law. The paper trade, both in the mill and in the selling end, must realize this fact. The present situation is likely to remain for many months. But this does not mean that the industry should sit down supinely and do nothing. The battle should go on constantly.

A change in the tariff law that will make imports of paper unprofitable will only come after a long, unrelenting, and statistical battle. And it is certain that even fortunes will not be handed to the paper manufacturers of America on a silver platter, nor should they be. Competition will always be keen. But the fight must not be dropped.

Importations are not vital to the American paper industry, but it would be a callow mind indeed, that does not admit the seriousness of the situation. While they never possibly could be the death blow of the American paper industry, they can be tremendously disturbing.

PAPER has every confidence in the heads of the American Paper and Pulp Association. It knows they will not leave any proper stone unturned in an effort to protect their members. But the fight must go on, unceasingly, vigorously and with discretion.

"JUST BECAUSE"

By B. T. McBain

THE law says that competing manufacturers must not work together; that jobbers must work by themselves except as to standards. Is that a good and sufficient reason why we should all take ourselves so seriously and think that we are the only fellow in the market? Is that cause for any of us to sell our product at a price which is below cost? Is that any basis for taking the stand that because someone of our mills are old and have been charged off to Depreciation once or oftener, that Depreciation should not be included in their cost figures, for the day is coming when replacements must be made and then what? Is that business reason for setting aside the use of common sense?

Is that any reason why anyone should accept prices for his product which will not allow of paying a fair wage to his workers and which in the end may shut his mills down and force not only loss upon stockholders; but upon that larger part of our organization, the wage earners?

I think that before long, one great majority of the American citizenship, the wage earner, will rise up and demand that the law makers of our truly great country change their views and take into consideration that the wage earners' prosperity begins with prosperity of their employers. As soon as these demands are made, the Courts of the land, always keeping their "ear to the ground", as they must; will then find it practicable and important enough to declare certain laws now on the Statute books, unconstitutional, because as at present, with cut throat competition in so many lines and Foreign goods coming in produced by cheap labor, what chance has either American employer to pay or American employee to receive an amount sufficient at all times to meet the needs of the average American family under present American standards of living.

In any event "Just Because" is no reason why we should not use our cost figures and charge a legitimate profit on our goods, no matter what some foolish competitors may be charging, for it is surely better to sell part of a loaf at a profit, than a whole one at a loss.

BOTH HAVE MOVED ON

CARLYLE was living in London. A man drove a wagon through the street on which Carlyle lived. On the wagon was a huge hat bearing its maker's name. It was one of the early crude attempts to advertise a product.

Carlyle at his window saw the hat go by. He walked to his desk and wrote a screed against advertising. "Good goods," he said, "are their own advertisement and no amount of hawking signs would make them better."

To Emerson is attributed the story of the mouse trap and the beaten path. Authorities differ as to whether Emerson was guilty but he might well have been. It is quite in keeping with his character and the time in which he lived, says A. Booster in The Ambassador, the zippy house organ of the Niagara Paper Mills, Lockport, N. Y.

But Carlyle and Emerson lived before modern business was born. The locality's supply was the local dealer's stock. The source of supply was known and handy. Advertising was unnecessary. There was no mail order business then. Catalogues were unknown. Jones in Chicago was not trying to sell to Brown in Boston, nor was Brown in Boston trying to sell Smith in San Francisco.

Today an army of traveling salesmen equipped with the necessary paraphernalia covers the country and spreads out across the civilized world.

It happens often that the best goods are made in places far distant from the place of market. Today, without advertising, Carlyle would not know about them, nor would Emerson, walking, be able to find them if all his days were spent afoot.

Advertising is today the key that unlocks the door to commercial knowledge. It is essential to correct buying information. If Carlyle and Emerson were living today, it is an insult to their intelligence to believe that they would not agree.

Absurdity In High Places

A SUDDEN shock of fear swept through all the various national associations of the paper industry when announcement was made a few days ago that Attorney General Daugherty had ruled—in reply to a letter from Secretary of Commerce Herbert Hoover—that associations may collect information with regard to production, sales, stocks, costs, and prices on closed transactions, but that such information must not be distributed among its members. It may, however, be transmitted to the Department of Commerce or some other Government agency, and through this medium be given to the general public.

Secretary Hoover in his letter to Attorney General Daugherty stated that associations will hardly go to the expense of collecting statistics if the only use that can be made of them is to transmit them to some Government department. "If this should happen," said the Secretary, "I fear that the efficiency of this department in carrying out the purposes set forth in the act creating it would be very greatly impaired."

The occasion for this correspondence was the recent decree of a Federal District Court in the Government's suit against the Tile Manufacturers' Credit Association of America and the Cement Manufacturers Credit Association in which the court restrained the association from distributing among its members certain information.

The ruling of Attorney General Daugherty is the veriest nonsense. According to some of the best legal advice in the country, it is not backed by either the law or a Court decision.

It is preposterous to think that Attorney General Daugherty can proceed to bring suit against the myriad trade associations in the paper industry and others for their dissolution. Most of these associations have their very foundations on the rocks of common-sense and square dealing rather than upon any hint of restraint of trade. The wisdom of the sage of Ohio seems to be missing on several cylinders.

The various associations in the paper industry are expected to sit tight and ignore the ruling entirely. A symposium of opinions of the leaders of the industry, although they will not be directly quoted, shows that they will ignore the ruling. And it is right they should.

As long as any association merely endeavors to give its members facts and does not attempt these three cardinal sins:

1. Control of prices;
2. Limit of output;
3. Manipulation of markets,

it has nothing whatever to fear. The gathering of facts and figures and their promulgation to a membership or in fact to the public if the public desires them constitutes no crime. These are the things the Department of Commerce has been clamoring for for years and has only just got going nicely. It is through such figures that millions of dollars are being saved annually.

Such services cannot be performed by the government. It would entail a burden that the government could not bear. It would mean a huge bureaucracy and vast masses of red tape and delay. It would be safe to assume that some two years after a terrific loss was sustained by an industry, the means of preventing it would appear.

It is the belief in some quarters that Secretary Hoover only wrote his letter to the Attorney General to smoke him out in the matter, so that the Department of Commerce and the trade associations would know where they stand.

To strike out the work of these associations would throw American industry back possibly two decades. The mere possession of knowledge seldom harms anyone and it gives the possessor of it a confidence that is invaluable.

Trade association leaders are plainly dissatisfied with the new ruling. Most of them refuse to speak for publication but personally have many pertinent things to say in the matter. And their views are seconded by many members.

It is possible that the emanation from the Attorney General's office was penned originally by a young and inexperienced department official and only approved by the Attorney General. But of course he must be responsible for everything his department does.

It is high time such all-inclusive, ill-considered rulings are themselves ruled out of American trade. To attempt to kill off organizations that are already working hand in hand with the government to prevent just the very things this new ruling aims at is like a slap in the face. It doesn't maim for life, it doesn't even seriously injure, but it is cussedly irritating.

A Week Crowded With Events

AS the date approaches for the second Paper Industries Exposition in New York, interest in the success of the enterprise grows more intense, not only on the part of the organized pulp and paper manufacturers of the country, but among the general public as well, who thanks to the initial exposition a year ago, have now a clearer idea of the fundamental importance of papermaking to the welfare of the nation. This year's exposition is certain to be more attractive and a greater success than last year's which was largely an experimental venture and one that was conducted under many handicaps and peculiarly trying difficulties. Notwithstanding the aloof attitude toward the first exposition displayed by several of the more successful and responsible firms, a sufficient number of enterprising concerns lent their support and at great expense exhibited the productions of the American paper industry in the varied forms of pulp and paper now used so universally. The builders of machinery employed in papermaking were better represented at the first exposition than were the makers of paper and paper products, with one notable exception, the Hammermill Paper Company, which put on a large and creditable exhibit of great educational value as showing the expanding use of wood fiber in the manufacture of fine papers. Bewildering to the layman must have been the presentation of modern papermaking machinery and processes and the evidences given of the numerous chemical and engineering industries on which pulp and paper manufacture is dependent.

That this year's display of machinery and of paper products and processes will far outshine the initial exposition of 1923 is already assured. The entire first floor of the Grand Central Palace will be given over to exhibits and the display will be reached by the main entrance to the exposition building on Lexington Avenue. Last year the exposition managers were unable to reserve the main floor of the building and as a consequence difficulty was experienced in installing some of the mammoth exhibits of machinery that were shipped to New York from distant parts of the country, the elevator to the fourth floor being inadequate to accommodate certain parts intended for display. No such difficulty will be encountered this year and the exposition space will be much more advantageous and accessible both for visitors and exhibits.

The Technical Association of the Pulp and Paper Industry is expected to take an active part in assuring the success of the Paper Industries Exposition and this is as it should be, since the growth and development of the association has been aided year by year by the promoters of the Exposition who are also the founders of the conspicuously successful Chemical Industries Exposition in which the chemists and engineers of the paper industry have always taken a leading part.

It is pleasant to recall the success of the second Chemical Industries Exposition held in 1916 at the Grand Central Palace, New York. The American Paper and Pulp Association and its lusty child, the Technical Association of the Pulp and Paper Industry, were represented at the opening ceremonies by special invitation, the other associations who were officially represented being the American Chemical Society and the Electrochemical Society. In formally opening the the Exposition an address on "The Connection Between Chemistry and Papermaking" was made by the present Technical Editor of PAPER, who was then secretary of the T. A. P. P. I. If the Technical Association of the Pulp and Paper Industry then took a prominent part in furthering the success of the Chemical Industries Exposition, what shall be expected of it when there is an exposition of paper industries to be promoted? Surely every officer and every member of the association will do his utmost to make the exposition truly representative and one that will demonstrate fittingly the extent and importance of papermaking among the great basic industries of the country!

The week of April 7 will be crowded with events for all who are connected in any way with the pulp and paper industry, for it is the week of annual meetings, which will bring to New York, not alone the manufacturers and mill technologists and engineers, but the vastly greater number of paper men represented by the merchants of paper holding membership in the National Paper Trade Association, the auxiliary associations, which include the mill supply dealers, and a host of others.

It should not be necessary to urge on all who purpose attending the annual meetings and visiting the Paper Industries Exposition to make early application for hotel accommodations. The editor of PAPER will be glad to assist in any way he can, and the secretaries of the various associations having headquarters in New York can be confidently depended on for information concerning, or help in securing comfortable rooms at hotel headquarters or adjacent thereto.

A Popular Talk on Cellulose

Some Chemical Reactions Explained in Popular Language—An Account of the Changes which Raw Materials Undergo in the Conversion Process

By JESSIE E. MINOR, Ph.D.

Flower in the crannied wall,
I pluck you out of the crannies,
Hold you here, root and all, in my hand.
Little Flower,—but if I could understand
What you are, root and all, and all in all,
I should know what God and Man is.

THE thought of the great poet nature-lover as he gazed on a commonplace little flower and meditated on the marvel of its construction, so delicate and yet so marvellously intricate as to be entirely beyond his comprehension, is expressed in the foregoing stanza. Just as sincerely could the artist papermaker gaze upon a sheet of paper and declare,

Scrap of paper on the office desk,
I pluck you out of the cluttered mess,
Hold you here, marvel of ages, in my hand.
Scrap of paper,—but if I could understand
What you are, fibers and sizing, and all in all,
I should know what God and Man is.

Still Guessing at the Nature of Cellulose

While the artists of the trade have been making paper of wondrous quality for centuries, it is comparatively recently that the chemists have begun to study papermaking and to analyze the materials used and the physical and chemical changes which are brought about in these materials during the process of making paper. These chemists now tell us that the fibers of rags and chemically cooked woods, both of which are used in papermaking, consist almost entirely of CELLULOSE. But when you ask them, "What is Cellulose?" they confess that, while they know that cellulose is a material abundantly supplied by nature, chemically it is one of those complex colloids about whose constitution they know little more than the poet knows of the construction of the flower in the crannied wall. However, in spite of this lack of knowledge as to the constitution of the original material used, there has been accumulated considerable information as to the physical and chemical changes which the papermaker is able to bring about in the materials used. A review of this information will serve to quicken our admiration for the complexity of the materials so abundantly supplied by nature.

In Which We are Introduced to "Residual Valence"

If we could sufficiently magnify a single fiber, we would see a central tube surrounded by a wall made up of a sponge-like structure of particles of cellulose held together in a very definite way by a force similar in nature to electricity, which is called by the chemists, Residual Valence. Fibers from different sources have also, besides this general structure, certain definite arrangements, as the striations of the cotton fibers, the large holes for the entrance of sap in the fibers of the spruce and pine trees, etc., and it is largely by means of these special markings that the different kinds of fibers used in papers may be accurately identified under the microscope.

Stains That Tell the Nature of Fibers

More convenient distinctions are brought out by the use of specific stains which, besides bringing out these specific markings more clearly, often give to one kind of fibers a color entirely different from that given to another kind. Thus Phloroglucinol colors groundwood pink and well cooked wood or rag remains colorless, the Herzberg stain colors groundwood yellow, chemically cooked wood a deep blue, and rag a wine red. With a little practice it is quite easy to determine by means of these stains, within one per cent, the exact proportions of each of two or more kinds of fibers which are used in the furnish of a given piece of paper. This test has been valuable in stabilizing the prices of paper since it gives to the buyer and to the competitor a method of knowing the exact value of the materials used in making each kind of paper.

> *It is difficult for a scientific person to put in plain language those facts of chemical interest which relate to the nature of cellulose and paper fibers generally. Dr. Minor has been successful in putting in popular language, such as will be understood by non-technical readers, some of the basic chemical reactions which cellulose fibers undergo in the preliminary treatment applied to them in the process of producing a sheet of paper. Many of the men in the mills and not a few "Higher-ups" and even paper chemists may derive useful information from a perusal of this paper or at least get a new slant on some of the processes of papermaking.*

All fibers when suspended in water have the power of absorbing water into their pores, especially if the water is slightly alkaline, and they will continue to take up water until the water is actually compressed within the tiny pores to a greater extent than in the surrounding medium. This is evidenced in a large way by the common experience of papermakers that dry pulp can be furnished to a beater up to 25 to 40 per cent of the weight of the water without causing any marked increase in the volume of the liquor.

Swelling and Bursting of Fibers in Water

When the fibers are first immersed in water, only the pores on the surface of the fibers begin to absorb water and swell. The limit of this expansion depends upon the amount of alkali in the water and the resisting power of the residual valence force which holds together the tiny particles which form the walls of these pockets. If there is no motion or friction, this swelling proceeds very slowly to its limit of expansion and then the pocket bursts, throwing the tiny fragments of the outer wall into the water. Because of the pressure of these swollen outer pores, the layer of pores just below the outer layer is unable to expand, but as the outer one bursts and relieves this pressure, the layer of pores next to this outside layer begins to expand and continues until it ruptures and allows the layer below to have its turn at swelling and bursting.

Heating of Stock in Beater a Chemical Reaction

This process continues in this way until the liquid becomes milky in appearance owing to the presence of such a large amount of swollen, insoluble particles of fiber wall and pore contents in the water. If the fibers are rubbed against each other, as in a beater, the breaking down of the fiber surfaces occurs long before swelling is completed and the resultant slowness develops much more rapidly and extensively than when pulp lies in the beater without motion. It has been definitely proved that in this process of swelling considerable heat is given out and it is this chemically developed heat, rather than the mechanical heat of friction which causes the heat development in the beater, especially when rag stock is beaten. The greater ease in developing slowness in a cold pulp than in a warm one is explained by the fact that a chemical reaction which develops heat is always repressed by outside heat and favored by cold.

Slow Stock Means Hydrated Cellulose

This process of swelling by the taking in of water which gives to a pulp its characteristic slowness is spoken of by the chemist as the HYDRATION of pulp. Coupled with this hydration and the breaking down of the surface layers of the fiber structure, there always occurs a partial change in the chemical constitution of the cellulose molecule which is called HYDROLYSIS and which gives to the swollen pulp and to the milky liquor filled with tiny cellulose particles that adhesive property which serves to cement more firmly the fibers together and close the fiber channels in order that the finished paper may the less easily absorb water, ink or grease. If the pulp is overheated or overbleached, then the cellulose molecule undergoes a different change and a compound called OXYCELLULOSE is formed which, once started, spreads rapidly through the paper causing loss of strength, yellowing and brittleness.

In the brushing or beating of fibers, hydration proceeds with relative rapidity followed by a slower hydrolysis, but when stock is cut, as in a Jordan or refining engine, then the exposure of the more tender inner surfaces of the fibers causes a rapid hydration without sufficient lapse of time for any appreciable hydrolysis. With Fourdrinier papers, this increased hydration very much retards the rate of draining on the machines.

Hydration Retarded by Acid

The addition of acid to a beater in a slight amount has a tendency to harden the fibers and retard hydration. Any excess of acid will cause a breaking down of the fiber structure and a brittleness of the finished paper similar to the formation of oxycellulose. Papermaker's alum has the remarkable property, when dissolved in water, of partially separating into alumina and acid. If there is anything like lime in the water which neutralizes this acid, more alum will separate, thus giving a continuous supply of a small amount of acid and at the same time protecting against the effects of a large amount of acid at any one time. Since for most papermaking processes it is absolutely essential that a small amount of free acid be present and just as essential that an excess of acid be avoided, alum finds a very wide use in the process of papermaking.

Greaseproof Papers

In the making of greaseproof papers, such as are used for butter and ice cream wrappers, it is desired to obtain the maximum amount of adhesive sealing material made by the hydrolysis of the fibers and yet to protect the fibers against so much hydration of the fiber surface as to destroy the fiber structure and lose that felting power necessary for the making of a strong sheet of paper. Therefore, in making these papers it is advantageous to add a small amount of alum to the beater at the time of furnishing to enable the beaterman to develop the excessive hydrolysis and yet protect against excessive hydration.

Pulp for Blotting Papers Must be Cut Rather Than Beaten

For blotting papers the furnish must be especially free from all foreign material and beaten as lightly as possible in order to leave open all the sap channels in the fibers that they may serve for the absorption of water or ink.

Theory of Rosin Sizing

For many other papers, including all the writing and printing papers, it is desired to have a waterproof surface. For this purpose the most satisfactory treatment is the addition of rosin in the form of a milk size to the beater. Rosin melts or dissolves to a very sticky substance and dries to a hard glossy substance which is entirely waterproof and, if it can be spread in thin layers over the individual fibers, it gives exactly the effect desired for printing and writing. The great difficulty in the way of easily applying the rosin coating to the fibers lies in the fact that the electrical charges on the surfaces of the fibers which cause chemical reaction are negative and can only firmly hold a positively charged surface. Unfortunately, rosin has a surface which is also negative and, therefore, normally there would be no affinity to bind the rosin and fiber together. If the rosin were dissolved in a solvent like alcohol and added to a furnish, the most of it would drain away in the back water due to this lack of affinity between the fiber and the rosin.

How Rosin is Used in Sizing Paper

To meet this difficulty the papermaker has a very ingenious scheme. He cooks the rosin with caustic soda or soda ash, thereby changing it from a negatively charged mass insoluble in water to a positively charged mass so largely soluble in water that as little as one per cent of the weight of the pulp in rosin can be made to adhere evenly distributed over the surfaces of the fibers. But this coating, even if it could be made to resist the backwater drain, would have no waterproof quality, so at this stage the papermaker adds to the furnish an amount of alum just sufficient for the acidity of the alum to release the negatively charged rosin. At the same time the alumina of the alum fastens itself very firmly upon the fiber and, by means of its positive charge, forms the cementing material by means of which the originally negatively charged fibers can hold the negatively charged rosin in a thin film over the entire surface. Also, the action of the acid has restored the rosin to a form in which it is capable of drying to a hard, waterproof surface.

Paper Stock Must be Hydrated

For the success of this rosin coating process it is essential that the fiber surfaces be sufficiently hydrated to hold the alumina firmly and this hydration cannot be maintained unless the stock is protected from overheating while in beater or Jordan engine. For a writing paper where a smooth surface as well as a waterproof surface is desired, the paper is sized with rosin in the beater then, after drying on the machine, it is dipped into a bath of glue or starch, dried and calendered.

Use of Fillers and Loaders

For book paper where, besides smoothness of surface, a certain amount of bulk or body is desired, the paper is usually finished, then coated with a thick paste made usually of casein and some filler like baryta or clay. For these papers greater opacity is also obtained by adding to the furnish a certain amount of filler as clay. While there is very little chemical affinity between such particles and the fiber surfaces, a large portion of it is held in the sheet by mechanical entanglement between the fibers and thus adds to the weight, bulk and opacity of the paper.

The time is rapidly passing when even those intimately connected with papermaking can claim anything like an intimate knowledge of the details of the process of all kinds of papers for the varied uses of paper today is demanding such varied production methods that, as with the flower in the field, it is beyond the ability or opportunity of one man to comprehend the whole of it.

A LAUGH A WEEK

A Good Joke On a Paper Trade Man

$5.00 for Each One Used

THIS WEEK'S WINNER

W. W. CRONKHITE,
Manager of Sales, Paper Section,
General Electric Company

A PARTICULARLY good story that is typical of the industry, is told on W. F. Robertson of E. C. Robertson and Sons, Hinsdale, Mass. This joke was told by Winne on himself so it probably *isn't* true but it is a good paper mill story in any event.

It seems Winne was supplying paper for a concern in New York who in turn was using it to make playing piano records. Winne was called to New York on a complaint that the paper was not up to standard. When he arrived at the customer's plant, the player piano record man took him into the factory and holding a sheet of Winne's paper up to the light, remarked as follows:

"Look at this paper, Winne, and please remember when you make paper for us in the future that it is our job to put the holes in the paper, and not yours."

ROTHERMERE INTERESTS TO ERECT MILL

Are Successful Bidders in Block of Timber Limits

It is authoratively stated that English interests, of which the Rothermere interests are said to be principals were successful bidders for a block of timber limits on the north shore in the Basin of the Manicougan River, and that they will erect a pulp mill, and later a newsprint mill a few miles from Quebec at an expenditure of sixteen million dollars. More than 1,000 men will be employed on the new enterprise. Concurrent with this report is the announcement that the St. Regis Company will build a mill in the same section, near the Parish of St. Augustine, at an expenditure of four million dollars. The reported mills of the British interests will likely be located at the western end of the city, a short distance from Quebec bridge. The larger part of the pulp manufactured, and later the newsprint, would be shipped to England to meet the growing demand of a group of newspapers there. Building operations will commence, it is said, when weather conditions permit. In the district this means that an additional investment of $19,000,000 or $20,000,000 for new pulp and paper mills for Quebec alone is in sight, to say nothing of other enterprises now under way.

CADMAN CONFIDENT OF THIS YEAR

Says Outlook is One of Promise and Anticipated Development

E. A. Cadman of the Canadian Pulp and Paper Association in a recent statement respecting the future of the industry in 1924 says: "The outlook for the coming year is one of promise and anticipated development. The new construction being undertaken in the newsprint branch of the industry is sufficient indication of the confidence in the future development of this industry in Canada. In other lines there are improvements and extensions being carried on and it is expected that general business conditions, which failed to come up to expectations in the later months of 1923, will show some improvement during the coming year. The industry in general has shown a good recovery from the effects of the depression of 1921 and 1822, and with the economies and reorganizations then effected, has experienced very stable conditions, during the past year, which will be an important factor in its development during the year to come."

Directors Re-elected

The entire board of directors of the Michigan Paper Company at Plainwell was re-elected at the annual meeting during the week. The election of officers was deferred until the February meeting of the board. Numerous improvements and an excellent business for the last twelve months were reported by George W. Gilkey, secretary and general manager.

Zwart New President

Richard Zwart, chief engineer, is the new president of the Foremen's Club of the Bryant Paper Company at Kalamazoo. He was elected at the annual meeting during the week to succeed George McGuire. Richard Milham, foreman of the Imperial division, replaces Nicholas Colignan as vice president; and Aloysius Hisgen, foreman of the unloading plant, was made secretary to succeed Irwin Starrett. A chicken supper followed the business meeting.

FORESTRY in the PAPER INDUSTRY

Conducted by J. R. Simmons, Secretary Forester, The New York State Forestry Association

MORE THAN PULPWOOD NEEDED BY MILLS

Claim Is Made That Far West Is Too Far from Eastern Market

AN extensive agitation on the Pacific Coast for the establishment of additional paper and pulp mills, based on the large timber resources of that region, has brought comment from a successful Pacific Coast manufacturer that something more than pulpwood is needed for the successful operation of paper and pulp mills west of the Rockies. This writer, one of the pioneers of the industry in the west, outlines the situation as follows:

"Except during the War it has never been possible to manufacture paper in the West on any basis that would enable successful competition with Eastern production in the markets of eastern United States or European countries bordering the Atlantic Ocean. The present production on the Pacific Coast is limited for a profitable market to the Pacific Coast states and to such foreign markets as adjoin the waters of the Pacific Ocean."

There are at least five essentials necessary for successful paper manufacture, he says: 1. Raw Materials; 2, Power and Steam; 3, Satisfactory Labor; 4, Transportation; 5, Profitable Markets.

The northwest, according to this manufacturer, has all but the fifth—"Profitable markets for our finished products." As pulpwood represents but 15 per cent. of his sell-

1. Raw Materials
2. Power and Steam
3. Satisfatory Labor
4. Transportation
5. Profitable Markets

The northwest, according to this manufacturer, has all but the fifth—"Profitable markets for our finished products." As pulpwood represents but 15 per cent of his selling price, his problem is, therefore, largely, the other 85 per cent. In addition to timber, water and transportation, he must cope with the necessity of providing reasonable social and welfare activities, which, in a sparsely settled region as that of western Washington or Alaska, may be a vital additional cost in securing and holding contented employees.

His pertinent comments on the possibilities of further development of the paper industry in the west may be summed up as follows:

"It is only natural that our great potential wealth of timber and hydro electric development possibilities should appeal so strongly but to those who have spent most of their active business life in the Paper Industry in the far west, these resources can only be profitably used when natural economic conditions of the United States change so as to permit Coast products to compete successfully in the markets of the whole of the United States."

To Plant Million Trees

A program for the planting of 1,000,000 trees in the region near Reading, Pa., is to be carried out during the coming spring. This will surpass the total planting for the preceding thirteen years in this district. A volunteer fire patrol including 20,000 school children has been formed to aid in fire prevention.

Associations to Meet

The American Forestry Association, which includes in its directorate some of the best known of the country's paper manufacturers, is planning for a banquet with notable speakers at the time of the annual meeting in New York, January 23. The banquet will be held the evening of that date at the Hotel Commodore, and an energetic committee on arrangements is already busy with plans for the program. It has already been decided to make the program non-technical in character, and the speakers will be men with a broad appreciation of the need for national conservation. Dr. Hugh P. Baker, secretary of the American Paper and Pulp Association, Julian Rothery, forester with the International Paper Company, and E. A. Sterling of James D. Lacey & Company, are among the men closely connected with the paper industry who are on the committee of arrangements. Other members are Nelson C. Brown, chairman. Barrington Moore, F. A. Silcox and John B. Burnham.

Association Submits Plan

A forest policy for New York has been formulated by the Empire State Forest Products Association, in which most of the big paper and pulp mill operators owning timber lands are members. The chief features of the policy endorsed as a proper one for the state include fire prevention, extention of public forests based on timber surveys, employment of nine district foresters to aid in fire prevention and to aid private owners in formulating plans for management of their lands to bring about continuous production of forest crops. A yield tax to preserve the forests, in place of the present method which tends to encourage the cutting of the timber, is particularly stressed. A feature of the plan is also the establishment of modern forestry management methods, to apply equally to private and state park land. In all the management plans the cooperation of the specialists of the Society of American Foresters is suggested as advisable in order to secure the best technical knowledge possible.

Pulpwood Study in the South

A study of the yields obtained from the southern yellow pine for pulp is now under way through the cooperation of the Great Southern Lumber Company with the Southern Forest Experiment Station. Cutting has been done according to different methods on a block of 200 acres. All seed trees and immature timber adjacent to the plots on which this study is being carried out have been tagged, mapped, and described in order to get the increased rate of growth on these trees which will follow the cutting operations. It is planned to remeasure these plots again in about five years.

An Interesting Note

A twenty-seven-year-old yellow poplar yields as much fertile seed as a fifty-five-year-old, according to the Appalachian Forest Experiment Station which has completed a study on this subject. The data so far shows that there is very little difference in the yield of seed from the two age classes. An average of 14 seeds to the strobile or seed container were found which probably mature into good seed.

FORESTERS TO HEAR FROM KELLOGG

Interesting Addresses on Program for February Meeting at Albany

CHAIRMAN W. G. HOWARD has prepared the following tentative program for the Winter Meeting of the New York Section of the Society of American Foresters to be held in Albany, Wednesday, February 6. The entire program will be open for informal discussions.

Sample Plots................A. S. Hopkins
What Constitutes a Practical Working Plan for a Lumber of Pulp Company in the Adirondacks..............H. S. Churchill
Research in Silviculture........H. C. Belyea
Commercial Possibilities of Reforestation.... ....O. M. Porter
Most Urgent Forestry Problems of Today ....C. R. Pettis
Progress in White Pine Blister Rust Control.......................A. F. Amadon
Relation of Gypsy Moth to Forestry in New York State..............H. L. McIntyre
The Need of an Advisory Committee for the Northeastern Forest Experiment Station.. ....S. T. Dana

The New York State Forestry Association will hold its annual meeting on February 5th, with banquet at the Hampton Hotel. Members of the New York Section have been invited to attend this meeting of the New York State Forestry Association.

It is fully expected that members of the New York Section, Society of American Foresters, will assemble in Albany in time to take part in the deliberations of the Forestry Association, February 5th. The Association's program, while not so technical in its scope, includes some able speakers including R. S. Kellogg, Secretary of the News Print Service Bureau; H. O. Cook, Chief Forester of Massachusetts; and Senator Rabenold, who sponsored a large number of the conservation measures in the New York legislature in 1923. Dr. William T. Hornaday, head of the Bronx Park Zoological Park, has also been asked to speak on the occasion of the joint dinner to be held on the evening of the 5th of February.

The Forestry Association, in addition to regular business, will hold an open discussion on forestry problems during its afternoon session. Non-members of the two organizations are cordially invited to cooperate in making the meetings productive of good results.

Buys Cut Over Land

The Washington state board of forestry has approved a proposal for the purchase of 8,000 acres of logged off lands, with good natural reproduction, to be handled for reforestation purposes. Two and three quarter million acres of land are assessed by state authorities for the cost of fire prevention, the rate ranging from 1¼ cents to 5 cents per acre. The cost of fire fighting during the past year was $167,687, and there were 640 fires, nearly 50 per cent of those whose causes are known being due to smokers, hunters and berry pickers. Nearly 60,000 acres were burned over, and the loss totaled 33,000,000 board feet.

Year Is Reviewed By Association

Summary Is Given of the Work Accomplished by Paper and Pulp Association As It Looks Toward New Problems This Year

NO year in the history of the American Paper and Pulp Association has een marked by more important activities on behalf of the paper industry in the United States than the year just closed. New and vital work of importance to the industry has been taken up, and important projects inaugurated, which will mean much to the paper manufacturers of the country.

Not the least of these has been the development of the monthly statistical summary for the entire industry. This work was taken over in June when discontinued by the Federal Trade Commission.

A conference on the increasing abuses of the import laws, such as dumping, under-valuation and improper classification resulted in aggressive action for the prevention of future abuses of this nature.

Still another important activity was the taking of steps which led to the formation of a special committee of United States manufacturers to combat the proposed embargo on Canadian pulpwood for American mills. This Committee on the Perpetuation of the Paper Industry in the United States includes many of the biggest men in America's paper industry. The Committee has worked actively to prevent action north of the border that might be mutually injurious to mills on both sides of the line.

Aye, Here's Action

"The development of export trade, and the restricting of unfair foreign competition in the domestic markets," will be two of the big features of the 1924 program of the American Paper and Pulp Association, according to the annual review of the organization.

And the paper industry will say Amen to this. If the association does just these two things it will have justified its existence.

When in the Spring a Swedish strike was in progress, affecting the situation in the United States, and later in the year when a Norwegian lockout was threatened, the Association kept its membership informed of the developments by maintaining cable contact with both of these countries.

Developments in the campaign for national forestry legislation, in which the paper industry has been a leader were also of importance. The Association was represented in several phases of this campaign, the executive secretary of the Association being vice-chairman of the Forestry Committee of the National Chamber of Commerce, which conducted a referendum after a year of investigation by the Committee. This referendum brought out the largest voting strength of any referendum conducted by the Chamber since 1917 and resulted in committing the Chamber to an aggresive national forest policy. The Association was represented by request at several sessions of the McNary Committee of the United States Senate which toured the country studying forestry conditions. The Committee is now sponsoring a bill providing all essential features of a national forestry policy as advocated by the paper industry.

Several important problems were handled in behalf of the industry before governmental bodies. The Association presented briefs to the Assistant Secretary of the Treasury in support of charges that Norwegian manufacturers were dumping kraft paper in this country. Many specific cases of customs abuses were presented to the Federal Customs authorities. The Association assisted in the fight of the coated paper manufacturers for a reduction of the duty on casein, which cannot be manufactured in quantities sufficient for the industry in this country. A hearing on this question was given by the United States Tariff Commission under the flexible provisions of the tariff law. The Commission has been asked by the Association to engage an expert to handle paper problems before the Commission.

A committee has been named to represent the industry in an advisory capacity for the Department of Agriculture, and the industry was represented before the Congressional printing committee in the committee's hearing at which an effort was made to have governmental specifications brought into closer conformity with the commercial practice of the trade, says the January Bulletin of the American Paper and Pulp Association.

Even the Pesky Income Tax

INCOME tax problems were handled through the Cost Association. A referendum was taken on the Mellon bonus and tax reduction plan, which showed the industry strongly in favor of the Mellon plan of tax reduction. Congressmen and Senators were notified of the result. Co-operation with the government on its standardization proposals, with a view to simplifying sizes and other economic forms of standardization was another feature.

Considerable assistance was given manufacturers in different parts of the country. The New York State proposed legislation to limit the activities of trade associations was combatted, on the ground that the proposed laws were unduly restrictive of individual activity of the paper manufacturers. A conference in Pennsylvania of engineers on the subject of stream pollution was participated in by the Association, and the policy of the central organization was stated as being for clean water, but insisting that a proper study of the whole subject be made in advance of legislation which mibht otherwise be economically impracticable. In Wisconsin the Association led in the organization of pulp and paper manufacturers to secure legislation to permit the development of permanent forest areas needed to fortify the paper mills for the future.

The Association participated with other national organizations in the study of such problems as arose from the threatened coal strike, the immigration problem, and in a survey of the national labor situation.

Backed Paper Industries Exposition

ON behalf of the industry as a whole, the Association provided the stimulus which resulted in the holding of the first Paper Industries Exposition. This was so successful that it is to be repeated in 1924. It was the first such exposition ever held by or for the paper manufacturers, and was attended by some 65,000 visitors in a single week. Two of the most important conventions in the history of the industry were held, the Spring annual meeting at New York, when it was determined to go ahead with well planned projects in behalf of the entire industry, and the Fall Business Conference at Chicago, when the manufacturers and merchants were brought closer together on mutual problems. In addition a series of luncheon conferences was held in every important paper making center, and these will be repeated during the coming year.

The Association was active in the successful effort to have a representative paper manufacturer named as a director of the United States Chamber of Commerce.

In the summary of the year's activities, the work of the Woodlands Section and the Information Service should not be overlooked. To a large extent these departments provide the machinery for the giving of general service.

There Is Prosperity Ahead

Leaders of the Pulp and Paper Industry Generally Express Confidence in the Coming Eleven Months

THE year 1924 will be kind to the paper industry. That is the only conclusion that can be drawn from the words of the leaders in the various branches of the industry. A canvass of their opinions is almost invariably optimistic. They are confident in saying that the worse of the bad times are over for the paper trade, that conditions are on the up-grade. Prices are better, the demand is stronger.

The paper industry has now recovered from the inevitable headache that was bound to follow the hectic boom time. The reaction has reacted as far as possible and a strong healthy growth is now coming.

The survey of the industry brings forth these opinions, which cannot be taken lightly:

Newsprint Looks Good

"If I read the signs of the business sky aright demand for newsprint will be strong throughout the greater part of the year. This should spell prosperity for the papermaking industry. It should also mean steady and profitable employment for all those who derive their living from this great industry."

PHILIP T. DODGE,
President,
International Paper Company.

* * *

"In general, the state of the paper industry at the opening of another year may be considered satisfactory. Basic conditions seem to be sound, the industry itself is in a good position to go forward after the inventory period is ended, and the mill stocks on hand are about normal, so that any increase in demand will mean an increased production to meet the requirements of the trade."

HUGH P. BAKER,
Secretary,
American Paper and Pulp Association.

* * *

"We feel that production will be greater in 1924 than it has been in 1923 but it is questionable if profits will be as great. Competition is growing keener and some may be forced out of business, yet others with reduced costs and quality goods will continue to get the business and make a reasonable profit.

Fundamentally this country is sound. Conditions all over the world are gradually getting better and we cannot see any reason for being discouraged over the outlook for 1924."

Z. W. RANCK,
President,
Crystal Tissue Company.

* * *

"I am of the opinion that any improvement in conditions abroad will increase their domestic consumption of paper to such an extent that they will not have much to export. In other words; the beginning of 1924 looks more encouraging to me than the beginning of 1923."

FELIX PAGENSTECHER,
President,
Bryant Paper Company.

* * *

"Although 1923 has been a banner year in the history of this company yet we anticipate a large volume of business and correspondingly a greater prosperity for 1924.

"As sulphuric and sulphurous acids, most of which are made from sulphur, enter either directly or indirectly the manufacture of nearly every product, we believe that the year 1924 will be exceptionally prosperous year throughout the country."

H. K. WEMPLE,
Sales Manager,
Texas Gulf Sulphur Co., Inc.

"There is no doubt that conditions in the paper trade will be near normal in 1924. Labor is so well employed at high wages that it does not seem possible that the spending ability of the people will be curtailed in any way and in our opinion the quality of business is dependent more on wages received than on any other single item. We surely have faith in the future, and are going forward with the belief that 1924 will be equal to 1923."

M. M. DEWITT,
President,
The Waterbury Felt Company.

* * *

"Agricultural products have been produced in abundance, and failures have not been excessive. Labor is very generally employed at remunerative wages, and as a consequence, the purchasing power of the people has not been impaired. But in spite of these facts, we find business slowing up. Orders given in small quantities, and there seems to be a general feeling of pessimism, a feeling that we have passed the peak, and are on the decline in the volume of business."

B. A. VAN WINKLE,
General Manager,
Hartford City Paper Co.

* * *

"We believe the fundamental conditions to be good; do not look for either a runaway market or a decreasing one, and are looking forward to a very good year."

B. A. FRANKLIN,
Vice President,
Strathmore Paper Co.

* * *

"Whereas some minds may seem somewhat disturbed owing to a feeling of over-production of paper, I have every reason to believe that the law of average, as is usually the case, will assert itself and after the usual temporary depression that generally follows the inventory period, we shall enjoy a year of business that will compare favorably with the business of 1923."

F. W. POWER,
President,
National Paper Trade Association.

* * *

"We believe the coming year bears good evidence of being a successful year from our point of view. While there was a little depression at the close of business for 1923 in the paper industry, there is no question but that it will revive in the near future. All industries throughout the country seem to be active and the purchasing power of the people is enormous.

"While it is national election year we believe that the country is well satisfied with President Coolidge and we will not have the depression that usually obtains in election years.

"Just at this time we do not see any breakers ahead and if the foreign situation clears up, which is always a factor in general business, we see no reason why this should not be one of prosperity for American business.

"We feel that fundamentals are alright and there is nothing for us to do but go ahead."

M. C. PURRELL,
Vice President,
The Orr Felt & Blanket Co.

* * *

"While there will be no boom, general business during the first six months of 1924 at least will be good. In most lines, however, the margin of profit will be below average rather than above average and some industries affected by particular conditions will undoubtedly find difficulty in making any profit. The particular conditions affecting the pulp and paper industry will be the extent of pulp importations from Europe."

S. W. WEBB,
President,
Eastern Manufacturing Co.

PAPER MILLS BUY OLD MARKS BY CARLOAD

Foreign Factories Find German Money Is Now Cheaper Than Cellulose

A LARGE part of the German flood of paper money is now being "redeemed" at no cost to the Treasury, through purchase by foreign paper factories as material for new paper.

Paper factories at Rosenberg, in Jugo-Slavia, and Frazenthal, in Czecho-Slovakia, for instance, have bought up old notes in small denominations by the carload to be turned into pulp, finding this cheaper than regular cellulose.

A carload of million-mark bills, for instance, is worth about a thousand times as much for papermaking purposes as its nominal value at the present exchange rate of four trillion marks to a dollar, while the one, two and five-mark notes, which were turned out in vast quantities when these denominations possessed actual purchasing power, are of too infinitesimal value to count.

The authorities at first looked askance upon this traffic in old money and arrested several dealers engaged in collecting and exporting it. It was soon realized that the notes were not worth as money the trouble of assorting and counting them, and that the Treasury, at no cost to itself, was getting rid of a note issue which had supported the entire budget of Germany for two years after the revolution.

"Powdered Paper" Wanted

One of our friends in the chemical line is seeking supplies of "powdered paper." Will any reader who knows of such an article and the manufacturer thereof be good enough to supply particulars? We have never heard of paper being obtainable in powdered form.

Economic Survey Completed

The State of Michigan has completed the first phase of the economic survey of the forest resources of three counties and much valuable information on the present condition of the forests and forest land in this region has been secured, announced the Lake States Forest Experiment Station.

CONSTRUCTION NEWS

A Summary of Vital Facts Regarding Construction, Finances and Operation of Paper Mills

Buck Run, Pa.—The General Paper Co., is perfecting plans for the electrification of its plant at Beaver Dam, Buck Run, and will replace present steam-driven equipment in practically all departments. Central station service will be used from the lines of the Chester Valley Electric Co.

Tonawanda, N. Y.—The Collins Mfg. Co., manufacturer of paper products, has acquired the plant equipment of the Bison Cone Mfg. Co., Buffalo. It will be used at the local works of the purchasing company on Young Street, for increased production.

Los Angeles, Cal.—Blake, Moffitt & Towne, 242 Los Angeles Street, wholesale paper, are taking bids and will soon break ground for the erection of a new addition to their plant, on site in the rear of the present structure. It will be four-story and basement, 187 x 216 ft., and equipped for general warehouse and distributing service, including handling machinery, conveying and hoisting apparatus, etc. It is estimated to cost close to $85,000. J. D. Galloway, First National Bank Building, San Francisco, Cal., is engineer.

Los Angeles, Cal.—The National Paper Products Co., and the Zellerbach Paper Co., 220 S. Los Angeles St., of which J. Y. Baruh is general manager have purchased a 25-acre tract at Cudahy station and will erect a paper mill at a cost of $2,500,000.

Los Angeles, Cal.—The Pioneer Paper Co., 247 S. Los Angeles St., has purchased 2-½ acres adjoining its present plant at 55th and Alameda Street and will erect an addition to cost about $40,000.

Marinette, Wis.—The Victory Bag & Paper Co., Ludington Street, is planning for the construction of a new two-story building at its plant, estimated to cost about $55,000, and expects to lay foundations at an early date.

Indianapolis, Ind.—The International Printing Co., 230 West McCarty Street, has preliminary negotiations under way for the purchase of the former plant of the Lafayette Motors Corporation, in the Mars Hill section, Lafayette Avenue. It consists of a main three-story structure, 53 x 500 ft., and a number of one-story buildings, located on a 25-acre tract of land. The purchase price will be in excess of $150,000. The purchasing company specializes in the production of paper boxes and containers, and purposes to remodel and equip a portion of the proposed new plant for this service, with plans to remove the present works to this location. Edwin A. Hunt is president, and W. H. Latta, vice-president.

New Orleans, La.—Work is to begin at once on a $20,000 warehouse building for the Letellier-Phillips Paper Co.

New Orleans, La.—The Bogalusa Paper Co., is to begin at once the erection of a $1,000,000 plant for the manufacture of chip board and all other kinds of board used in the manufacture of containers, and as soon as this paper mill is in operation, which it hopes will be in about four months, they expect to install machinery for the manufacture of solid fiber and corrugated shipping cases and all kinds of small boxes.

St. Joseph, Mich.—The Williams Brothers Paper Box Mfg. Co., has plans under way and will take bids early in the spring for the erection of a new three-story addition to its plant on East Broad Street, to be equipped for general manufacture. Ralph Oliver, 115 South Dearborn Street, Chicago, Ill., is architect.

St. Stephen, N. B.—The Hollingsworth & Whitney Co., 185 Devonshire Street, Boston, Mass., manufacturer of paper products, is proceeding with plans for the erection of its proposed new pulp and paper mill on local site, on the St. Croix River, and expects to take bids in the near future. It will consist of a number of buildings, estimated to cost close to $350,000, including equipment.

St. Louis, Mo.—The Orchard Paper Co., 713 Spruce St., will expend about $30,000 remodeling the building it recently purchased, and will install machinery.

Winnipeg, Man.—Fire, Jan. 1, destroyed a portion of the five-story building on Williams Avenue, occupied for the most part by the John Martin Paper Co., Ltd., with loss to the company in stock and equipment, estimated in excess of $300,000. It is planned to re-establish the works at another location at an early date.

New Companies

New York, N. Y.—The Peerless Folding Box Co., has been incorporated with a nominal capital of $5,000, to manufacture paper boxes and containers. The incorporators are M. and J. M. Kornfeld, and C. Salk. The company is represented by Mackinstry & Kornfeld, 198 Broadway, New York.

New York, N. Y.—The Wansco Paper Products Co., has been incorporated with a capital of $10,000, to manufacture paper goods and deal in specialties of this kind. The incorporators are R. Parizer, I. and C. Wansker. The company is represented by M. S. Seidler, 291 Broadway, New York.

Grand Rapids, Mich.—The National Box Board Co., has been incorporated with a capital of $2,475,000 and 125,000 shares of stock, no par value, to manufacture box board, paper board and kindred products. The incorporators are Harry C. Angell, A. H. Apted and J. M. Alt, 561 Turner Avenue, Grand Rapids.

Long Beach, Cal.—The Western Paper & Envelope Co., has been incorporated with a capital stock of $150,000, by Bert P. Boles, H. G. Pohlman, Walter P. Warmbold, Leigh A. Hume, Frank H. Jacques.

Greenville, Tex.—The Greenville Paper Co., has been incorporated by W. H. Camp, T. D. Starnes and others.

Financial

Muskegon, Mich.—The Central Paper Co., has filed notice of increase in capital from $1,400,000 to $2,600,000, for general expansion.

Chicago, Ill.—The Arc Paper Co., has filed notice of reduction in capital from $50,000 to a nominal amount of $2,000.

Philadelphia, Pa.—A voluntary petition in bankruptcy has been filed by Auer & Twitchell, Inc., 134 South Third Street, paper dealer. The assets are stated to be $229,924, and the liabilities, $203,819. John M. Hill will act as referee in bankruptcy.

Plant Operations

Boston, Mass.—The majority of the paper and pulp mills in the New England district are running on a good production schedule, giving employment to close to a normal working quota. This is in decided contrast to the relapse in the industry in this section sustained during the summer period, and since that time there has been a gradual trend towards normal. It is said that the bulk of the mills will continue on the active list for some time to come.

Newark, Del.—An action to show cause why an injunction should not be issued enjoining from the alleged pollution of White Clay Creek, has been brought against Curtis & Brother, Inc., operation a local paper mill, and the American Vulcanized Fiber Co., with adjoining local plant. It is held that the alleged pollution is making the stream unfit for other use.

Stamford, Conn.—The Pine Waste Products Co., Inc., is reported to have leased a tract of land in Georgia for the establishment of a paper and pulp plant, but company makes statement that no decision will be made for sixty days about establishing a plant in that state.

Iroquois Falls, Ont.—The harvesting of pulpwood in the northern portion of Ontario has been inaugurated in active fashion and a large output is expected. It is said that as soon as snow comes, work will begin on hauling the logs in, and large stocks for mills throughout this section will await this activity. The Abitibi Power & Paper Co., is one of the prominent companies in this section, and has commenced to harvest heavy quantities of material for early disposition.

Business Opportunities

The Bureau of Foreign and Domestic Commerce, Washington, D. C., has information regarding a company at Montevideo, Uruguay, in the market for American machinery for the manufacture of paraffin paper milk bottles, No. 8742. Also, of a concern at Goteburg, Sweden, desiring to purchase a quantity of blotting paper for offset printing service, No. 8765. Full information upon request.

EXPANSION OF VICTORY COMPANY HAS NOW BEGUN

Huge Warehouse Will be Constructed at Marinette so That Factory Space May be Increased

THE Victory Bag & Paper Co., of Marinette, Wisconsin, has under construction a large warehouse, just across the street in the rear of its big plant on the corner of Ludington and Wells Streets. This warehouse will permit the company to utilize more room for factory purposes and a considerable expansion will be the result. The output of present bag product will be increased and the company will enter into the manufacture of bag specialties also.

This will mean an increase of about fifty employees the installation of more machinery and the gradual maturing of plans for more expansion in the near future. The new building is to be of frame construction, one story high and 100x170 ft. in dimensions, thus affording 17,000 additional feet of storage room. The building will be so constructed that an additional story can be erected. When this is done it will be connected with the main building by overhead construction. For the present only one story will be built and a chute extending across the street will permit of sending the bags across the main factory buildings, for storage and shipment.

1923 PULP IMPORTS STILL UNDER THOSE OF 1920

Large Volume of Paper Produced Does Not Reflect Larger Imports

THE large volume of paper produced in the United States in 1923 does not reflect a corresponding increase in imports of pulpwood, according to compilations made by the American Paper and Pulp Association.

Pulpwood imports from Canada in 1923 were considerably below those of 1920, when the production of paper was only slightly larger than that of 1923, though the value of the wood imported was higher. Figures for the four yearly periods ending November 30, 1923, the latest month for which figures are now available, show that imports of wood in 1923, while large, did not bring up the average imports for the four years to the total importation four years ago.

Imports of pulpwood for the Canadian fiscal year ending March 31, 1920, totaled 1,600,000 cords. Imports for the last four, twelve month periods ending November 30, based on Canadian governmental and trade association reports, were as follows:

Year Ending	Cords
November 30, 1920	1,323,149
November 30, 1921	1,218,123
November 30, 1922	971,967
November 30, 1923	1,416,558
Average per year	1,232,449

It is evident from a comparison of the imports of 1922 and 1923, that the higher imports for the latter year were merely sufficient to compensate for the abnormally low imports of 1922. The 1922 period was one of low production. Even with the greatly increased production of 1923 the imports for the year ending November 30 were less than 200,000 cords above the four year average, as indicated above.

Mellon Thanks Paper Industry

The action of the American Paper and Pulp Association in endorsing the Mellon plan for tax reduction has brought the following expression of appreciation from Secretary Mellon:

"I received your letter stating that members of your Association in recent meetings have expressed approval of my recommendations for tax revision and disapproval of the bonus. I am glad to know that the Treasury's recommendations are meeting with approval and note that you will ascertain the wishes of your members through a referendum and bring their views to the attention of Congress."

Waste in Pulp and Paper Industry

Lack of Safety Appliances and Thought

By B. T. McBain, *Assistant General Manager, Nekoosa-Edwards Paper Co.*

IF a railroad is known to have more accidents than average, people fear to travel that route. Waste. If a steamship line is managed by careless people and some ships have been wrecked, with loss of life because of poor management, lack of repair, or carelessness generally, travellers seek another way to their destination. Waste.

So it is with cities—one will have a greater number of accidents and deaths from violent causes than another and that sort of advertising does not help it. Waste. People will always hesitate when a place, a means of conveyance or what not is known to be unsafe. They will wait for the next car or the next taxi even at the expense of time. Waste.

Office buildings have been known to lose tennants because of unsafe elevators or careless operators and it is a difficult matter to get new tennants in such event. Waste. Factories of every kind soon become known to the working people as unsafe places to work, if they are not as careful as they should be in the guarding of machinery, or if the Foremen insist upon the workmen performing certain or all work in an unsafe manner. Waste.

There are pulp and paper mills that live up to the Laws in safe guarding of machinery and receive A1 certificates from State Inspectors, but who act only in a cold blodded business manner and comply with the Law only because they have to. They do not get the good out of the work they have done, unless they properly organize their employees to think Safety. Less than 25% of the safety game is guarding of machinery. There are mills today guarded to the limit that are having more accidents than other mills who are not complying with the requirements of the Safety Code. The reason is apparent. No one thinks Safety; even the employees resent the placing of guards. Waste.

In Nepco mills it is different. Safety pays. Waste stops. Careful men make careful workmen. Careful workmen use care in the making and finishing of the product. Careful men ship the paper. In the past four years, the savings have been enormous. The work done by our Safety Department with the aid and guidance of the National Safety Council, has saved much loss to employees and employer alike.

The record shows:

1920 — 212 accidents.
1921 — 158 "
1922 — 154 "
1923 — 100 "

Every time a man is injured that accident is an economical loss—the employee suffers pain, possibly loss of life or limb, the employer suffers loss in many ways; but just in proportion to the importance of the man in the Organization.

Safety Pays—Mr. Pulp and Paper Manufacturer and I recommend the National Safety Council, its principles and its teachings to your early earnest attention and action.

NEWS FROM CANADA

BARNJUM CONTINUES TO DELUGE NEWSPAPERS

Fighter for Embargo Uses Every Argument He Can Find in the Matter

F. J. D. BARNJUM of Annapolis Royal continues to deluge the daily and weekly newspapers of eastern Canada with letters protesting at what he terms the "efforts of United States pulp and paper companies to hoodwink the Canadians into defeating the embargo." It was thought that Mr. Barnjum's letter writers would be now suffering from writer's cramp, but such was apparently an erroneous opinion. The leader of the fight for the embargo accuses representatives of United States pulp and paper companies with attempting to manufacture opinion against the embargo throughout Canada. He does not explain why hundreds of settlers went before the Pulpwood Commission and vigorously opposed the proposed embargo, and even went so far as to protest against the export tax, which is looked upon as a substitute measure for the more radical embargo on shipments of pulpwood to the United States.

Mr. Barnjum has been campaigning against the present Canadian government in two special elections. In both instances, the government candidates were beaten, and Mr. Barnjum states that the failure by the government to impose the pulpwood embargo, was the reason for the defeat of the government candidates. Sentiment is in opposition to the embargo as disclosed by the hearings of the pulpwood commission.

Action Has Been Started

Action has been started at Osgoode Hall, Toronto, by a legal firm representing the Fort Frances Pulp and Paper Company, against fourteen Canadian pulp and paper companies, to recover payment of "the difference between the value of the Canadian fixed price for all newsprint paper supplied to Canadian newspaper publishers in excess of the plaintiff's proportion during the years 1918 and 1919 whilst the distribution and price of newsprint paper was under Government control.

Heavy Cut Is Expected

Weather conditions in Northern Ontario having been exceedingly good for timber and pulpwood operations, Hon. James Lyons, Minister of Lands and Forests, stated in Toronto last week that a very heavy cut of timber and pulpwood was expected this fall. Sufficient frost and snow have made the roads suitable for heavy operations, while little snow has drifted in the bush. Pulp cutting concerns report that weather conditions have been very favorable. "So heavy is the cut we have almost exhausted our list of scalers," stated the Minister. "In fact, this, and several other indications point to one of the best winters for lumbering that has been experienced in many years."

Vancouver Hard Hit

Vancouver interests have been very hard hit by the Whalen pulp and paper failure, having claims to the extent of nearly $1,000,000. They have asked the provincial government to investigate the circumstances under which there was a transfer of receiverships and it is understood that this will be done.

McLEAN HITS PULP THAT IS FROM ABROAD

Says Canadian Pulp Manufacturers Cannot Continue to Compete Along the Same Lines

THE following forecast of conditions in the pulp and paper trade for 1924 has been made by Angus McLean, president and general manager of the Bathurst Company of Bathurst, N. B., pulp and paper manufacturers and owners of vast pulpwood lands in eastern Canada:

"There are large quantities of Scandianvian pulp coming into the American market and this foreign pulp is being sold at ridiculous prices. This means that Canadian manufacturers of pulp are today selling their product under cost, in trying to meet this competition. If this thing continues there is no hope whatever for pulp and paper and conditions for this year look anything but hopeful. Our only hope is that trade in the United States continues on the boom, and the Scandinavian pulp manufacturers decide they cannot afford to continue manufacturing and shipping pulp at the ruinous prices that prevailed all through 1923.

"The cost of logging this winter is to be increased considerably over last winter. The only remedy for us pulp producers is to inaugurate so efficient an organization that we can reduce our cost of production but this only can be attained by a general lowering of costs which would include wages and workmen's compensation. Wages, taxes and workmen's compensation must be reduced and brought down to the very lowest possible basis. My slogan for 1924, would be 'efficiency and more efficiency and still more efficiency.' We cannot emphasize this too much, and the only hope for the pulp and paper trade in the eastern provinces of Canada, in my opinion, is we can sell our products, meet the foreign competition and still make a profit. At the present cost of production it is certainly not possible to do this. I would surely emphasize the necessity of economy and of faithful work on the part of every worker and this would help us to compete with the foreign manufacturers. Then there would be something accomplished during 1924."

United States capital is largely interested in the Bathurst Company which owns a large pulp mill and a large and new paper mill. The pulp mill was enlarged last year, so that capacity is increased one-third. The company also built tidewater decks, and hydro-electric station on the Nepisiguit River.

Want Compensation Reduced

One of the questions that are of interest to the pulp and paper manufacturing executives in Canada, is that of reducing workman's compensation rates and thus allowing the manufacturers of pulp and paper to participate in the compensation schemes of the various provincial boards, without exorbitant cost. In the province of New Brunswick, the cost of such compensation is beyond all reason, due to hostility of politicians to the pulp and paper industry. Another question that is of interest to the industry is that of wages. It is the opinion of many close students that wages must be reduced if the industry is to compete successfully with the Scandinavian imports.

NEW EFFORT TO USE STRAW FOR PAPER

DeVain Process Company Making Experiments With Canadian Straw

WESTERN Canada is very hopeful that a way may yet be found whereby her huge straw piles may be converted into paper. In this connection much interest is attached to the experiments of the DeVains Process Co., of Grenoble, France, which has now under consideration the establishment of a pulp-straw plant in the vicinity of Winnipeg. In order to conduct further experiments along this line, 200 bales of wheat, oats and straw flax from the prairies were shipped recently to Havre, France, where they will be sent to the Grenoble plant of the company. There it is proposed to manufacture the product into straw pulp and reship to Winnipeg for inspection purposes. If the straw-pulp proves to be suitable for the production of high grade paper products, it is proposed to establish mills near Winnipeg that will produce from 50 to 100 tons of paper daily.

Representing the De Vains Company Sir Frederick and M. Dolfus visited Winnipeg some months ago and were said to be very favorably impressed with the outlook for the industry.. Abundance of raw material and a ready market for the output were factors that weighed heavily with them. Western interests are also watching the experiments very closely, and as there is unlimited supply of straw on the prairies, other mills will assuredly be built, if the process is a success. It has been thought that the failure of the Becker Company might seriously affect the venture, but it is now assured that this will not result. If straw can be made into paper at remunerative prices, all the money necessary to set the industry on its feet may readily be secured in Canada.

Paper Companies Use Power

A number of the big pulp and paper companies in Ontario have been large contributors to the development of hydro-electrical power in Canada during the past year. The Spruce Falls Company completed a 2,500 h. p. development at Kapuskasing, on the river of the same name, for use in connection with a sulphite plant at that point. In the Kenora district the Backus-Brooks Company installed two additional 1,200 h. p. units in its plant at Kenora, and with four more if the same capacity early in 1924, the station will have a total capacity of 12,000 h. p. for use in connection with the company's pulp and paper mill. The Dryden Paper Company also completed an installation of 1,400 h. p. on the Wabigoon River.

New Discount in Effect

The paper jobbing houses of Toronto at the first of the year put into effect a new quantity discount list on the standard mill brands of high grade bonds and ledger papers. Ream and case lots remain unchanged but the ton discount, which was formerly fifteen per cent, has been changed to twelve and a half per cent in assorted tons. In solid tons of one brand or watermark the discount is seventeen and a half per cent. A couple of brands of bond papers have been reduced two cents a pound, long list price.

NEWSPRINT MAKE YEAR'S RECORD GOOD

Canadian Pulp and Paper Industry Had a Splendid Year During 1923 in General

THE Canadian pulp and paper industry had a good year during 1923, this being true especially of the newsprint end of it. The chief feature was the growth of the manufacture of newsprint, which went well over 1,250,000 tons, or about 170,000 over that for 1922. This was brought about through increased output on the part of existing mills and by the opening of new ones. Six new newsprint machines were installed; two at St. Lawrence Paper Mills, a new mill at Three Rivers, Que.; two at the Fort William Paper Co., a new mill at Fort William, Ont.; one at the Belgo Paper Co., Quebec; and one by the Bathurst Co. at Bathurst, N. B. These machines added 445 tons to the daily newsprint output of the country bringing the total up to 4,400 tons daily. Another two new machines are about to come in.

The heavy demand from the United States, and the ease with which newsprint may be shipped there meant a steady market that encouraged an increase in the output. On the other hand shipments to other countries fell off, this being especially true in the case of Australia, where the British Preference hurts Canadian exporters. Exporters of pulp increased during the year, but in the United States keen competition was encountered from the mills of northern Europe. And the same may be said of outside competition in book papers.

The outlook for the industry in 1924 is one of steady business. It is expected that the United States will maintain its demand for newsprint and conditions there in Canada appear to be fairly stabilized. Prosperity in the pulp and paper business, of course, depends on prosperity in business generally, and as the prospects for the latter appear to be bright the industry should thereby benefit. The chaotic conditions in Europe, however, will make it difficult for Canadian mills to do well in the foreign market. In the meantime plans for considerable extensions are going on apace, which of themselves are an assurance that the outlook is fairly satisfactory.

Papers Are Merging

Recent amalgamations and mergers in the Ontario daily newspaper field have caused some speculation as to whether or not the cutting off of so many papers would affect the quantity of newsprint consumption. Previous to the war every town and city in Ontario of 10,000 population and up, with the exception of one or two places, had two daily papers, and in some instances three. During the war, owing to the high cost of newsprint, high labor cost extended news service and greater overhead expenses for collection of news, there were a number of amalgamations, but since the war closed there have been more mergers than during the five years of the conflict.

A Good Thing to Know

S. J. Frame, secretary of the Toronto Carton Club, has sent out a circular to the Canadian paper box making trade pointing out that if in the process of making boxes the imprint, "Printed in U. S. A." is in any way eliminated from the printed matter received from the United States, the paper box manufacturer is liable to a heavy fine. It is recommended, therefore, that the imprint be in such a position that it cannot be cut off when the printed matter is put to the use for which it is intended. It is suggested that the Canadian manufacturers, in respect to box wraps supplied by them, that the imprint "Printed in U. S. A." be inserted in inconspicuous but legible type immediately below the center design.

Many Are Wondering

As the late F. H. Anson, together with Alexander Smith of the firm of Peabody Houghteling & Company of Chicago are understood to have held 54 per cent of the outstanding common stock of the Abitibi Power and Paper Co., much interest has been manifested in the disposal of this, especially as it was held under a trust deed, and in the natural course of events would have been kept off the market for a considerable length of time. The unexpected death of Mr. Anson confronted the executors with a problem; but it is understood that a syndicate has been formed to take over the Anson holdings, and that these will be held together for some time. Several prominent Montreal people figure in the syndicate, among others some who have long been prominent in Abitibi.

Hawkins Brings Suit

Edwin Hawkins, of London Township, Ont., recently brought suit against Charles W. Cox, lumberman and pulpwood dealers of Port Arthur, Ont., to recover $1,000 for services said to have been rendered in Government circles in connection with pulpwood limits. Judgment has just been delivered in favor of the plaintiff for $400. In his pleadings Hawkins said he went to Toronto in February and March, 1923, during the Labor-U. F. O. regime "to prevent large timber limits from being acquired by a corporation which would debar the defendant's operation as a dealer, and to negotiate with the Government to the end that the defendant might obtain an opportunity to acquire by tender or otherwise certain timber lands and rights that were being disposed of by the Government and desired by the defendants." The limits are around Fort William.

Plan to Dam River

At a recent meeting of the Richmond, Que., town council, F. J. Campbell, general manager of the Canada Paper Company, outlined a proposal to dam the St. Francis River 30 feet high at Ulverton, Que., and back the waters clear up to Richmond. This is an electrical power development which the Canada Paper Company will undertake provided it can get the provincial government to put up at auction the lease rights of the Ulverton power and this hinges on whether the Richmond town council will pass a resolution saying that it has no objections. The plans are now being considered by all parties concerned.

May Build Pulp Mills

It is understood that American capital is interested in a proposal to build pulp and paper mills near Campbellton, N. B., on the Restigouche River, and that in this connection enquiries have been made of the New Brunswick Electric Power Commission with a view to securing a supply of current. The pulp mill would be built first, if the venture goes through, and will be quite large.

Increased Their Output

Despite the fact that a number of difficulties were encountered by the book paper trade, the Howard Smith Paper Mills enlarged their output in 1923, the incerase in sales being approximately 10 per cent over those for 1922. The export sales amount to about 10 per cent of the output. Secretary H. Crabtree says: "As very little of our tonnage is sold on contract, the volume of unfilled orders at the end of the year is small, but sales are keeping up in a satisfactory manner. The number of employes is about the same as last year. When one takes into account what the world conditions are like today, it is difficult to say what conditions in our industry will be during 1924. But there are indications that the European situation is improving and this should be reflected in better business during 1924."

BAKER PRAISES THE A. E. F. FORESTERS

Adapted Himself to French Methods During the War, Secretary Says Before American Legion

"HOW the American lumberjack, used to the methods of the American lumber industry in getting out timber, was able to adapt himself to the technical requirements of the French forestry service was one of the romances of the war," said Dr. Hugh P. Baker, executive secretary of the American Paper and Pulp Association, before the City Club Post of the American Legion this (Tuesday, Jan. 8) noon. "This readiness to adapt himself to the highly technical forestry methods is evidence that as the practice of forestry develops in this country the American lumberman will be able to put into effect the most advanced methods of forestry practice.

"As a technical forester, I am proud to say that the forestry profession was more largely represented in military service in proportion to its membership, than any other group of professional men—due in part to the fact that it is a young profession, made up of the highest type of out doors men.

"As the war in Europe advanced it became evident that the nation or nations which could control raw material—plus men of course—would eventually win the war. How the United States recognized this is shown by the fact that lumber production was under way for the A. E. F. in December, 1917, when six saw mills were put in operation in France. At the time of the armistice there were 90 operations, including 81 saw mills, including nearly 12,000 technical engineer troops and 8,500 service troops, all under the supervision of the Forestry Engineers.

"At the time of the armistice the monthly requirements of the army, according to Lieut. Col. W. B. Greeley, now chief of the U. S. Forest Service, were 50,000,000 feet of lumber 250,000 railroad ties, 6,500 pieces of piling and 1,500,000 poles, as well as 100,000 cords of fuel wood."

Just a Few Facts

Aside from the ordinary uses for paper for newsprint, books, magazines, wrapping and the usual lines of stationery and office, supplies are found some special uses of interest—packings for gas engine and hydraulic work, in the shoe business for box toes, counters, heel boards, etc.; in candy factories for imprinting trademarks on the bottom of sweets; in the novelty trades for flowers, new wall papers and all kinds of fancy goods.

Paper now enters into waterproof, greaseproof and even fireproof articles, among which are spoons, dishes, cups and saucers, table covers and napkins.

Starting with baby carirages made from so-called Japanese fibre, which is nothing more or less than paper, and ending with the crepe paper-lined casket, our lives cannot be separated from the use of paper and paper products.

Loses His Life in Mill

John O'Leary, an employe of the hydro pulp mill at Campbellford, near Peterboro, Ont., lost his life a few days ago. He was adjusting a belt on the shafting when he was hit on the head with the propeller and instantly killed. He leaves a wife but no family.

Turn to the Clearing House and Read Every Line—It Will Pay You

SPACE SELLING FAST FOR ANNUAL PAPER EXPOSITION

One Manufacturer Sold $8,000 Worth of Machinery and Takes More Space This Year

THAT one paper manufacturing company which exhibited at the first Paper Industries Exposition secured enough direct sales as a result to fully compensate for the expense of the space taken is given by this company's sales manager for an increase of the space to be taken for the Second Paper Industries Exposition at the Grand Central Palace the Week beginning April 7th. A machinery manufacturer placed $8,000 worth of business in the course of the week, and this manufacturer of supplies has also taken increased space for the 1924 Paper Show.

With a large proportion of last year's exhibitors already contracted for space next April, the exposition management is working out plans for the dividing of the main floor of the Grand Central Palace into separate divisions for different types of exhibits. Several of those who have already secured space have taken more booth space than last year. Several have doubled their space, while others have taken three, four and even five times the space used at the first Paper Show. At least one manufacturer has been forced to cut down his space below what he desired to secure because the available space which he desired was already taken by another company.

With the exposition still nearly three months distant, this evidence of the value of the big show by "satisfied customers" is extremely gratifying to the management. The Exposition space is being subdivided into sections, with the machinery, supply, chemical, equipment houses all segregated into their respective groups, paper and paper products having the center of the floor, and other products into another group, and so on throughout the whole big floor.

The fact that all the paper manufacturers associations, as well as the merchants are to be in New York for their annual conventions during the week of the Paper Show will aid in making the 1924 Paper Week a big week for every department of the industry. The American Paper and Pulp Association and its affiliated organizations will be in session during the week at the Waldorf-Astoria, as will also the National Paper Trade Association, composed of the paper merchants. The Technical Association of the Pulp & Paper Industry, best known as TAPPI, will have its big annual meeting during the week, and if last year's program is duplicated will have one of its general meetings at the Exposition. If this is done, the program will be such as to include problems of interest to the Superintendents. Many manufacturers after viewing the exhibits a year ago said that it was an excellent opportunity for the superintendents to see the array of equipment and machinery that was shown.

The general plans for the Paper Industries Exposition are already well formulated. It is decided, for instance, that the Paper Show will be so organized as to be of great interest to the general public, as well as to those directly interested in the manufacture of paper and paper products. The story of how paper is made will be graphically shown. Educational exhibits will be included in space provided by the Exposition management for agencies which serve the industry in an educational capacity.

Before many weeks have passed the general plan of the Exposition will be submitted to the members of the Advisory Committee, which will include every group interested in the proper organization in Exposition form, of the story of paper and its making.

Takes Over New Quarters

The International Purchasing Company, which has for some years occupied offices at 141 Milk Street, Boston, has leased a suite of offices on the seventh floor of the Province Building, 333 Washington Street, Boston, and will move into its new quarters the first of next month. The company is a large buyer of papermaking rope and similar products.

SAFETY WORK AT NEKOOSA-EDWARDS MILLS IN 1923

Safety First Work Has Greatly Progressed During the Year, Correspondent Writes

ONE of the most important factors in the paper mill industry of today as well as every other one is the "Prevention of Accidents."

At the Nekoosa Edwards Paper Company with Mills at Port Edwards and Nekoosa, Wisconsin during the year of 1923 there was conducted a most strenuous "No Accident" campaign. 1923 is now a year of the past and it has been in many ways an important factor in the History of Nepco. Some of the accomplishments are known to all, as they are visible to the eye. The new additions to the mills, with new machines, and other extensive improvements, all tending to increase production and at the same time give employment to more men.

But one of the greatest accomplishments of the past year has been the decrease in the number of accidents. This is the first time in their known record of the mills where there have been less than 100 accidents, and this is in spite of the fact that there has been extensive construction work, which is always dangerous, and that the number of men employed has been materially increased.

Comparing the record of 1920 with that of 1923, one is astonished to find the list of accidents has been reduced by one-half. From 212 to less than 100.

The safety campaigns have had a great deal to do with this reduction and the Nepco safety department is to be congratulated on the splendid work they have done.

The bronze trophy put up by the company was won by the Nekoosa Mill. The mill scoring the least number of accidents during the month made the score. The score was Nekoosa 7, Port Edwards 4, with one month resulting in a tie.

The careless workman is a menace to any company, both to himself and his fellow workman. When a man's carelessness causes an injury to himself it is regrettable, to another it is a Crime. The man who takes no chances with his fellow workman's life will seldom take chances with his own.

A more strenuous campaign has been started for 1924 and it is hoped to decrease the record of accidents in 1923 by 25%. That will mean 75 accidents for the year, about 6 a month, 3 for each mill. The usual trophy will be put up for 1924 and Port Edwards is bound and determined to win it.

During 1924 there will probably be an Inter-Mill Contest among all the paper mills of the State of Wisconsin.

Davis Heads New York Chemists

C. E. Davis, chief chemist of the National Biscuit Company, it was announced today, has been elected chairman of the New York section of the American Chemical Society for 1924. Mr. Davis succeeds Dr. Charles A. Browne, recently appointed chief of the United States Bureau of Chemistry. P. A. Levene of the Rockefeller Institute was named vice-chairman and D. H. Killeffer, associate editor of the *Journal of Industrial and Engineering Chemistry,* secretary and treasurer.

The new executive committee is composed of Prof H. R. Moody of the College of the City of New York, Prof. R. R. Renshaw of New York University, Col. Raymond F. Bacon, chief of the technical division of the Chemical Warfare Service, A. E. F., and H. B. Faber, consulting chemist.

Lease an Entire Floor

The Continental Paper and Bag Mills of 18 East 40th Street have leased the entire tenth floor of the Pershing Square Building at Park Avenue and Forty-second Street, New York City, which they expect to occupy about March 15th next. The new location affords much more space than at their present address which was found necessary for the business expansion planned for 1924.

Hugh P. Baker Says

Secretary of the American Paper and Pulp Association

DEAR MR. KEENAN:

The last copy of PAPER has just come across my desk and the fact that you are again its Editor pleases me very much indeed. I like the new form of the material and I want to assure you of our interest and help in making PAPER what you would like to have it.

Sometimes I have wondered if the paper industry may not be blessed with too many journals. I have always stopped at the point of wondering and have not attempted to form any conclusion in the matter. I know that the journals which are giving service will continue, and in its new form and with its new Editor, I am very sure that PAPER will give valuable service to the industry.

With best wishes for 1924, I am,

Very truly yours,

HUGH P. BAKER, Secretary.

Apprenticeship in Paper Mills

Outline of a Plan Proposed by a Joint Committee Representing the Various Technical Associations

By **W. G. MacNAUGHTON**
Secretary of the Joint Committee on Apprenticeship

An outline of a scheme for apprenticeship in paper mills which has been drafted by W. G. MacNaughton, Secretary of T. A. P. P. I., for the joint committee on Apprenticeship representing the Canadian Technical Section, the Superintendents Association and the Technical Asociation, is published herewith.

There is to be a meeting on the subject in connection with the annual meeting of the Canadian Technical Section to be held at the Ritz-Carlton Hotel, Montreal, on January 24, and the outline will be presented for discussion as part of the report of the Joint Committee.

Apprenticeship is distinct from, although related to, the training of skilled operators as well as vocational education for pulp and paper mill workers. There is in addition the development and training of foremen and superintendents where there is necessary not only knowledge of the operations involved and skill in them but also executive ability and judgment. When a system of apprenticeship has become fully developed and its value appreciated it might follow that the higher skilled operators both in pulp and paper mills would require to have taken the apprenticeship course but at its inception it is not to be expected that individual mills will be able to take on more than one or two apprentices a year since in some departments, during training, they would to a certain degree be supernumeraries. If, too, it is arranged to furnish instruction or assistance at stated periods, in their studies, it might be necessary to give it during a period when they would otherwise be employed.

Remuneration During Course

As to remuneration, at the beginning of the course it should be sufficient to cover the living cost but should not be more than that of the lowest common labor. During the course the rate should be increased a small amount at the end of each period of training, the increase being dependent on the attainment of proficiency in the particular phase of training.

If an apprentice started at $50 a month with an increase of $5 at the end of each period, at the completion of fourteen periods he would be receiving $120 a month. On the basis of twenty-five days of eight hours each the final rate would then be sixty cents per hour. The base rate might be $71 a month with increases of $3.50 a month, giving the same rate at the end. It might be advisable to leave the matter of compensation to individual agreement or perhaps to fix the relation which the apprentice rate should bear to that of a regular operator.

Educational Qualifications

The educational qualifications required for apprenticeship would be high school graduation or its equivalent so that the apprentice could proceed at once to the special studies required in the course without being obliged to devote time on elementary subjects.

Courses Provided

In the correspondence courses provided by the University of Wisconsin and the Massachusetts Division of University Extension, there are the following unit courses: Mechnical Pulp, Sulphite, Soda and Sulphate Pulps, while among those of the Institute of Industrial and Domestic Arts there are in addition Beater Room Practice, Paper Machine Operation and Paper Finishing. In any scheme for apprenticeship these courses and others that may later be devised, should be linked up with periods of practical training in well operated mills, of sufficient length to insure sufficiency. The end desired is the production of papermakers and since under modern conditions most of the paper made is from wood pulp rather than from rags the papermaker should know how to make the chief pulp used in the kind of paper he elects as his specialty.

Kinds of Paper

The chief kinds of paper made in largest volume, and neglecting the special boards and special papers, are news, book or printing, wrapping, tissue, writing and board. They all differ in fiber composition, preliminary treatment, method of paper machine operation and to a certain extent in the type of machine used. In consequence of these rather wide differences the apprentice would almost of necessity have to select early in his training the particular kind of paper in the making of which he desired to become proficient.

Considering the kinds of paper named they may roughly be classified as follows, the kind of paper being named first, followed by the pulp used and machine on which it is made:

News, mechanical pulp, fourdrinier machine; Book or printing, bleached sulphite and soda, or waste paper, fourdrinier (straight or Harper); Wrapping, unbleached sulphite, or sulphite and mechanical, fourdrinier (ordinary or M. G.); Tissue, unbleached and bleached sulphite and rags, fourdrinier and single cylinder; Writing, bleached sulphite and rags, fourdrinier; Boards, waste papers, and mechanical pulp, multi-cylinder.

At its inception no attempt should be made in apprenticeship to cover special board or special papers of various kinds. In all cases the minimum educational requirement should be high school graduation and it should begin by a period of practical experience in the mill laboratory, perhaps with similar periods with each phase of training, especially those dealing with pulp manufacture.

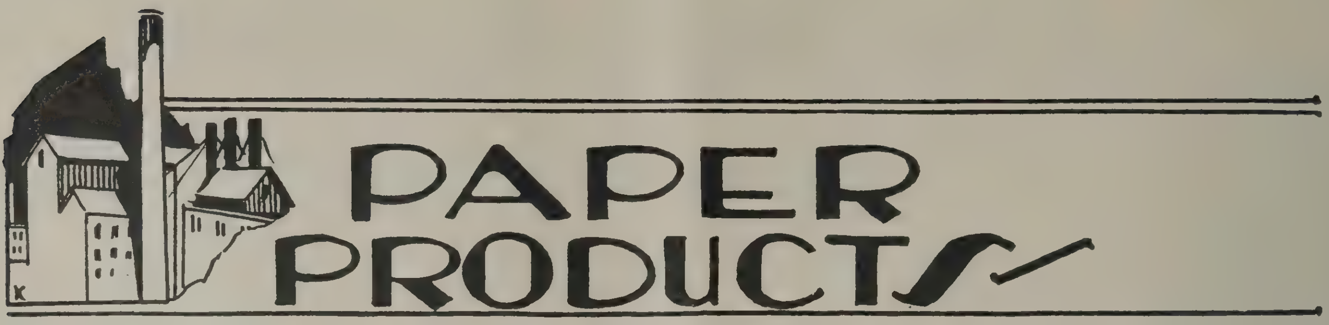
Study and Practical Work

The course of study for the apprentice should be divided into major and minor subjects, depending on the kind of paper upon which he is specializing. The major studies should cover the branches of chief importance while in the minor ones he would get a general knowledge of allied subjects. It is attempted to outline the courses of study and character of practical training that might be required with the suggested minimum period of practical work. The courses of study are divided as follows:

(1) Mechanical pulp; (2) sulphite; (3) soda; (4) sulphate; (5) bleaching; (6) beater room practice; (7) waste paper; (8) rags; (9) paper machine operation; 10 paper finishing.

Reduce Tax on Newsprint

A reduction of fifty per cent in the sales tax on newsprint went into effect on Jan. 1, as a result of a conference at Ottawa when various features of the impost were discussed. Beginning the first of the year the sales tax on newsprint is now three per cent instead of six per cent, and the reduced rate will apply to newsprint used exclusively for producing newspapers and quarterly, monthly and semi-monthly magazines, weekly literary papers unbound, hymn books, religious tracts and Sunday school lesson pictures.



The Paper Specialty As a Need

Pioneer Specialist in Specialties Writes Illuminatingly On Important Part of Paper Making

By J. E. WILLERT

Sales Manager,
American Paper Forming Co.

PAPER is more susceptible to conversion into useful, sanitary and ornamental articles than any other manufactured product. Its cheapness lends itself finely to the economy necessary in any article for a one time use only or for temporary decorative purposes. The manifold uses created contribute to sales of a large volume. The multitude of its grades disclose unlimited possibilities for conversion.

In the same period that the telegraph, telephone, typewriter, talking machine, moving picture, automobile, motor boat, airplane and the radio came into the world, came the paper bag, the paper folding box, toilet paper, paper towels, oyster pails, ice cream pails, paper napkins, paper plates, paper doilies, paper cans, paper spoons, and the long list of paper specialties. The place of these is secure in the world, their service lightens burdens and injects pleasure in the every day grind. Their influence for good is as great in their sphere as that of the great inventions.

Now a Dignified Thing

HUMAN need has dignified the paper specialty. The paper specialty manufacturer has a vital position in the consumption of paper. The paper manufacturer a further important position and an ever increasing outlet for his products. A perfect coordination should always be maintained between these industries.

The necessity of a standardized price for a paper specialty is apparent, the decorative side not needing it so much as the one time use side. Decorations are used on special festal occasions, holidays, etc., a desire for pleasure causing the demand. The one time use side is a strictly service side and the price must be such as will allow it to meet the ability of the service rendered to absorb it. Thus, although the price may fluctuate with the buying power of the dollar it must not so constantly change that it will bring confusion to the ultimate consumer. The price can be a compelling force or a deterrent.

As human knowledge increases the call for greater utilities becomes more insistent, the paper specialty has a major place in answering this call. The paper specialty manufacturer keenly alive to this hunger has an enviable future. His market is not entirely a commodity one, but a service one as well.

The understanding of the paper specialty market, etc., needs its scope and its service absorption possibilities are a controlling factor in the success of the paper specialty manufacturer. A wide source of information should be at his disposal.

The Need of the Brand

SELLING is psychological, the approach to the buyer and the impress left determine the volume of sales. The prospective customer must be made to feel the lure for buying. These are times when all things are distinctive and highly specialized. All commodities are being branded. Manufacturers are educating the public to buy their goods by asking for their brand, claiming for it all needful virtues.

Living examples of brands are we. Our breakfast consists of branded coffee, branded grapefruit or orange, branded bacon, branded eggs and branded bread, clothed in branded underwear and suit we walk in branded socks and shoes, sporting a branded necktie in a branded collar on a branded shirt, topped off with a branded hat. We eat, drink and sleep branded.

The paper specialty manufacturer has adopted brands, but the danger is in having too many brands, this a manufacturer should avoid. In the multiplicity of names some are forgotten and none make a dent. A few striking brands hit hardest.

The popularization of his brands is a problem we must solve, the firm implanting in the mind of the consumer that he has the leaders, he must establish. Some manufacturers are reaching the public by advertising in the weeklies and monthlies, seeking an increased use of their product by an effort to enlarge the use of the commodity to which the service of their product is necessary, featuring that the virtues of the commodity used are greatly enhanced by the superior service that their product renders.

Other manufacturers are reaching out through differing periodicals, featuring their product as a boon in their sanitary and useful effects on the physical and the home life.

The success of this character of advertising can only be gauged after a sufficient period of time has elapsed to allow the public to absorb the idea and get the habit. Its greatest value is to incite the distributor to talk more and to gain publicity.

What it Must Have

THE practicability of a paper specialty, the value it offers, the superiority of its service, how well it meets the expense to be absorbed in its service, the economy it may afford are determinators in its sale. If these conditions are not well met all advertising is of no value, but the meeting of these conditions coupled with proper advertising are big strides to large demand and consumption.

In the Paper Industries Exposition of last year, the first one to be held, a number of paper specialty manufacturers demonstrated their product and the interest shown by both distributor and consumer gave strong proof of desire to be better posted on this section of the paper business.

Successful demonstration is the strongest and most lasting appeal that can be made and it is through exhibits of the character of the Paper Industries Exposition that the manufacturer can reach the distributor, and it is by attending such an exhibit that the distributor can become posted in a line which will be of lasting worth.

During the coming year many new paper specialties will be introduced, the fertile minds of inventors are at work in this field. This past year there have come under my observation many new ideas in paper specialties as well as many new improvements in paper specialty machines. Opportunities large and prolific are open both to papermaker and specialty manufacturer in this field.

The paper specialty is no longer a specialty but a staple. It has become a staple specialty as necessary to a distributor's stock as the most staple sheet of paper he has, an enlivening sales maker full of growth.

Rush to Northwest Forests

R. W. Vinnedge of North Bend, Washington, in an address, "The Genesis of the Northwest Lumber Industry and Its Development" delivered under the auspices of the Yale university school of forestry, predicted that the zenith of lumber production in the Pacific northwest would be reached within two decades.

Lumbermen of the east and the south are going to the northwest now to secure timber holdings as the forests in the east and south are being exhausted. Large tracts of forest land in Washington and Oregon have thus changed hands.

PAPERGLAS

Registered United States Patent Office

The Utility Paper With a Thousand Uses

Here Are Some of Them

- Advertising Envelopes
- Airproof Wrappers
- Bags and Containers
- Book Inserts and Jackets
- Bottle Wrappers
- Bread and Cake Wrappers
- Coffee and Tea Bags
- Film Wrappers
- Florists' Wrappers
- Fruit Wrappers
- Glove Wrappers
- Greaseproof Wrappers
- Laundry Wrappers
- Millinery Bags
- Candy Cups
- Odorproof Wrappers
- Sandwich Wrappers
- Soap Wrappers
- Complete Envelopes
- Tobacco Wrappers
- Tracing Paper
- Window Envelopes

PAPERGLAS provides an excellent hygienic wrapping for food, candy, cigarettes, drugs, and all products that require moisture, dust, grease, and air proof coverings. No chemicals are used in its manufacture. It is made in plain bleached, special transparent and eleven designs of embossing, covering every requirement. There is a large field of demand for PAPERGLAS and every paper house should have it in its line. Your salesmen can always sell this utility paper. PAPERGLAS in your stock will add profits to your ledger.

What W. H. Deubener Did with a String and a Paper Bag

By LUTHER P. WEAVER

A PIECE of String.

Guy de Maupassant made a classic of it.

W. H. Deubener, St. Paul, Minn., groceryman, turned it into—a big growing manufacturing business.

One fall night in 1918, this St. Paul groceryman couldn't sleep because of an idea.

Day after day for four years since he had started the first cash-and-carry grocery in St. Paul, he had been wrestling with the problem of making packages easy to carry. He wanted his customers to have tidy bundles, ones that would not come undone and spill groceries all over a street car floor.

This night he tried to sleep but a vague outline of what might be a solution of his problem kept intruding itself into his semi-consciousness. At last fully awake, he grasped the import of the thing that had been trying to force itself into his mental vision, namely, and to quote his own words: "Strings through and around the sack; I could see them going around it in a way that would make just the strong shopping container I wanted."

This was along toward morning. He arose quickly, and, after dressing, hastened to the garage and cranked up his flivver. His wife, as much interested in the idea as he was, accompanied him on that memorable ride down town to the store. It's a good thing for Deubener that traffic cops were not around. Once in the store he grabbed the first empty sack he could lay his hands upon and passed cord—common white wrapping cord—around it from top to bottom and through the sack in the identical manner in which millions of housewives have found it on the Deubener shopping bag in the stores throughout America. It was the first Deubener shopping bag, and though various improvements have been made in materials, the idea of the strings is the same.

How It Has Grown

THIS bag, about fifteen inches wide by eighteen inches deep unopened, probably has been as important as any single factor towards reviving individual and profitable shopping by housewives. It enables a shopper to have a neat appearing container in which to put a grist of groceries up to seventy-five pounds in weight, and furthermore she—or he—gets them home without trouble for the two heavy cords that pass around and through the sack carry all the weight from the bottom.

Deubener began making the bags that same fall in a corner 10x10 feet square in his warehouse, the daily output at that time being 500 to 600 bags and his total force of employes—two women.

They used an old leather punch to punch the holes in the bag by hand, through which holes the strings passed. In two years the factory has been enlarged four times, the total floor space now being 15,000 square feet, with the employes totaling as high as sixty workers. And his output now is 100,000 bags a week.

Deubener's first order was for twenty-five bags from a St. Paul wholesale grocery house, and last year he sold 8,002,200 bags.

Deubener Speaks

ASKED about difficulties encountered in making his article a success, Deubener's reply was characteristic. "Difficulties! We had so many we cannot begin to think of them all now," he said. "You must remember this bag was a new thing never made before and we had practically war conditions with which to contend.

"The best method of doing each operation had to be figured out, each piece of machinery created in the mind, then built to order only to be rebuilt time after time. Meanwhile our money was melting away.

"One mistake we made was to advertise our bag before we were in shape to handle the business. Every mail brought us orders and inquiries in a flood and at one time we were nine months behind our orders.

"One problem we remember distinctly came up when we got into our new factory. We needed fifty more girls to increase our production but it was at a time when manufacturers were bidding against one another and we could not get enough help. We tried every way for several days, until finally we thought to ourselves: 'Why not give married women a chance to earn some money working odd hours.' We advertised and got all the women we could use.

Deubener has perfected the equipment of his plant as business increased, every piece of machinery, as he said, having been invented by him. Such equipment includes a double punch to take the place of the old leather punch and a string cutter, three of which were entirely rebuilt before he got one that would do the work right. Now he is working on a machine that not only will punch the holes in the bag for the strings to pass through but also will paste on the bottom of the bag the protecting strip which holds the cords in place.

Besides United States rights, patents have been obtained in the Philippine Islands, Denmark, Canada, with application made for the English rights and other leading countries.

Inquiries have come from Melbourne, Havana, St. John's, Newfoundland; Lausanne, Switzerland, Paris and London, and from Belgium, Norway, Italy, India, China and Japan. Besides going to many states of the Union, shipments have been sent to Honolulu, Canada and Panama. They will go into many new foreign ports in 1921, and this will also increase the production of the home plant materially in the next year.

All this because W. H. Deubener fumed and fretted one night back in 1918 over his customers' carrying problems, finally corralling the elusive idea of strings that would go around and through a big sack, supporting the weight from the bottom, and forming handles at the top that wouldn't pull out.

THE NEW WOOD PRODUCT —CELLOPHANE

New Product Lends Itself to Many Uses, It Is Being Found

By JAMES PIANI

THIN as tissue but hard to tear; like paper but not paper; transparent as glass but not glass—a non-fragile, waterproof product with a singularly wide range of uses—that's cellophane. Possibly you do not know it by that name, but surely you have seen the de luxe material that perfumers, confectioners, and other manufacturers use to wrap their fancy packages.

A chemist named E. Brandenberger first made cellophane in 1903 at Taon-les-Vosges, France. Today Bezons, eight miles northwest of Paris along the river Seine, is the home of the French cellophane industry and the source of supply for practically all of the product now used in this country. But American consumers will not have to wait long before American-made cellophane will be available, for the Du Pont Cellophane Company, a subsidiary organization of the Du Pont Fibersilk Company, is now building a large plant at Buffalo, New York, for the manufacture of this interesting material. Just why Fibersilk Company is interested in cellophane manufacture becomes clear when it is understood that both products are identical in composition and both follow through the same manufacturing processes until the final stages.

The raw material used is pure wood pulp, first treated with caustic soda, then with carbon bisulphide. The product thus obtained is completely soluble in water, and the solution is called viscose—an absolutely transparent fluid that can be compared to collodium. Viscose coagulates or solidifies very rapidly when brought into contact with certain salts or acids, just as the white of an egg does when it is brought into contact with boiling water; and this cellulose solution is used without distinction for the manufacture of both artificial silk and cellophane. It is only in the method of their fabrication that these two products differ. When artificial silk is made, the viscose is forced through a nozzle having a number of minute holes, and all the filaments obtained are solidified as they pass through a coagulation bath. The reunion of the filaments constitutes a silk thread.

In making cellophane, the viscose passes into a manifold and is forced through a slit-like aperture into a coagulation bath where it solidifies in the form of a sheet. Then it is treated chemically to eliminate all foreign matter. Washing and drying complete the process and the final transparent product is a sheet approximately 35 to 38 inches wide, from 1/1000 to 5/1000 of an inch thick, and of indeterminate length.

This sheet is perfectly transparent, with its surface as smooth and lustrous as polished glass. Of homogeneous texture, without pores and fibers, it is far stronger than paper. It is supple and flexible. A heat test shows that even at 100° Centigrade cellophane will not disintegrate as paper does. It burns like paper, however, but is not highly inflammable. Cellophane put into boiling water does not melt nor is it in any way affected. It also resists the action of acids or bases. One of its most valuable properties is waterproofness. Grease, ether or gasoline put in cellophane will not penetrate or evaporate. Containing no animal matter, cellophane does not decompose, is bacteria-proof and can be easily sterilized in an autoclave.

Remarkable as these properties are, the list is by no means complete, for cellophane, like other cellulose products of which paper is perhaps the best known type, lends itself to many finishing operations.

Stephenson Is Bound for Piccadilly

J. Newell Stephenson, M. S., editor of *Pulp and Paper Magazine of Canada,* intends to leave for the British Empire Exhibition at London some time in March. He will sail from Boston and be gone at least six months. Mr. Stephenson is an American citizen and has a multitude of friends in the membership of T. A. P. P. I. and elsewhere, who will wish him a happy and profitable sojourn in the land of his forbears.

SECOND ANNUAL
PAPER
INDUSTRIES
EXPOSITION

You can benefit immeasurably by the Paper Exposition in two distinct ways

1. It will give you a profusion of new practical ideas and information which will promote economy and efficiency in your mill. It will do this through exhibits of:

Raw Materials—pulp, chemicals, dyes and colors, sizes, fillers, etc.; **Machines** of all kinds used in paper mills; **Instruments of Precision** for recording, controlling or measuring temperature, volume, pressure, speed or velocity, etc.; **Apparatus** for examining and testing materials and products by chemical and physical means; **Forestry** care, use, management and reforestation; **Recent Developments** in paper making—in short there will be exhibits of everything connected with the paper industry.

GRAND CENTRAL PALACE
NEW YORK CITY
WEEK OF APRIL 7, 1924

2. This Exposition will give you an opportunity to get in closer touch with your market, and increase your sales through an exhibit of your own. You can tell the story of your products and your service in a graphic way to thousands of the very people on whom your greater success depends—which is the essence of good advertising.

REMIND YOUR SALES DEPARTMENT that this golden opportunity to make some worth while strides forward should not be overlooked.

The Exposition will be on the MAIN FLOOR of the Grand Central Palace this year. Select space for your exhibit now. Write for costs and diagram.

PAPER INDUSTRIES EXPOSITION
Grand Central Palace New York City

KRAFT BY-PRODUCTS MEN TO ERECT RE-CALCINING PLANT

W. D. Mount, Consulting Engineer, Will Make a Report on Proper Place

ON December 13, 1922 we printed in this magazine an article on the proceedings of a meeting of the Kraft By-Products Association held in Chicago on November 30th. At that meeting it was decided to select a place for the erection of a lime sludge re-calcining plant.

During the past week an inspection was made by W. D. Mount, consulting engineer of Lynchburg, Virginia, who for many years was connected with the Matheisan Alkali Works and now with the Glamorgan Pipe & Foundry Co.; Professor A. H. White, Head of the Engineering Department of the University of Michigan at Ann Arbor, Michigan together with Mr. B. T. McBain, Chairman of the Kraft By-Products Association, which is composed of kraft pulp manufacturers of Wisconsin, Michigan and Minnesota visited the following plants for the purpose of determining the one best suited for the installation of the plant.

Wausau Sulphate Fibre Co., Mosinee, Wis.
Stevens Point Pulp & Paper Co., Stevens Point, Wis.
Nekoosa Edwards Paper Co., Nekoosa, Wis.
Falls Manufacturing Co., Oconto Falls, Wis.

Data was secured at the above mentioned plants and Engineer Mount will make a complete report on the place best suited for this proposed plant to save the lime sludge which is now being wasted.

Another meeting will be called for a final decision and arrangement as soon as complete report is received from Mr. Mount. This meeting will probably be held in Chicago or Milwaukee.

Claim Colorimeter Is Needed

The Bureau of Standards of the Department of Commerce recently carried out some measurements of the color characteristics of white paper, the results of which have been published in Technologic Paper, No. 244, for sale by the Superintendent of Documents at 5 cents per copy.

In attempting to measure the color properties of white paper use was made at the outset of a single reflection of light from the paper into a spectrophotometer. However, it was found that the color differences of various papers were so small that they could not be determined readily and accurately by this means.

A colorimeter, designed and built by **Prof. A. H. Pfund**, of Johns Hopkins, was next tried. This makes use of three or more diffuse reflections from the paper, and determines the color characteristics by measuring the coefficient of diffuse reflection for red, green, and blue light. 21 samples of paper of commercial grades, collected from various sources, were tested with satisfactory results. It was found that all specimens were deficient in the proportion of blue light reflected and to a much less extent in the green.

Lastly it was found that the colors of these same samples could not be successfully matched by the unaided eye, even by trained observers. For instance, there was practically no agreement among the 17 individuals as to the "whiteness" of the various papers. This would seem to be a good argument for the substitution of this colorimeter for the unaided eye in the color grading of white paper.

Campbell Honored with Appointment

A. H. Campbell, traffic manager of the International Paper Company, one of the traffic men asked to represent the American Paper and Pulp Association at the January 3 organization meeting of a Shippers Regional Advisory Board for the Middle Atlantic States has been asked to serve as chairman of the paper and pulp committee of the new organization. L. B. Palmer, of the American Newspaper Publishers Association has been named as vice-chairman of the committee. The function o fthe board will be to supply the railroads with accurate information concerning carload requirements of the shippers in the district and to cooperate with the railroads to secure adequate service. It will also endeavor to adjust difficulties between shippers and the carriers, without resort to the Interstate Commerce Commission, but will not handle rate problems. The American Paper and Pulp Association was also asked to participate in a general railroad conference at Washington, Jan. 9, when the problems of the railroads were taken up on a national basis, under the auspices of the United States Chamber of Commerce.

Building New Warehouse

Tileson & Hollingsworth, paper manufacturers and paper dealers of 49 Federal Street, Boston, are constructing an additional storage warehouse at 854 River Street in the Hyde Park section of Boston where they already own a large plant.

SAYS MILL POLLUTION IS NOT INJURIOUS TO FISH

Conservation Commission, in Response to Inquiry, Gives Facts on River Situation

POLLUTION by paper and pulp mills, while it may at one time have been responsible for almost eliminating game fish from the Wisconsin River, is not now of such a degree as to interfere materially with such fish, is indicated by information which Elmer S. Hall, state commissioner of Conservation, and officers of paper mills in the Wisconsin Valley, have given.

Whether the presence of frequent effect upon game fish has an adverse effect upon game fish is not definitely decided, but investigations conducted by the federal and state governments have revealed that game fish will not take advantage of fishways to pass around dams.

Pulp Waste Injurious

Paper mill waste, according to Mr. Hall, is not detrimental to fish when turned into a river the size of the Wisconsin. Pulp mill waste, he says, is detrimental to fish life, but can be kept out of the river by a device known as the "saveall." Such devices, of greater or lesser effectiveness, have been installed by all pulp mills on the Wisconsin River, and efforts are continuously being made by most mills to perfect them.

Existing laws forbidding the pollution of streams with injurious materials are enforced, according to Mr. Hall, and paper mill men report that occasional inspections are made by state deputies.

Statement by Hall

Mr. Hall's complete statement of the situation is as follows:

"1. It has been the experience of this commission that paper mill waste when turned into a river the size of the Wisconsin River, has not detrimental effect on fish. The waste from pulp mills we find is detrimental to all kinds of fish, as the pulp which escapes through the screens seems to settle in the still water in the bend of the river, which are natural spawning grounds for a great many fish and accumulation of pulp both prevents the spawning of fish or smothers the eggs after they are spawned. As to other factory and mill refuse, it depends largely upon the nature of the factory and the waste that is turned into the stream.

Can Avoid Damage

"2. I think there is no question but what with a reasonable expense all mills and factories can avoid disposing injurious waste materials in the river. In the case of pulp mills the saveall which will catch the fine pulp which is now being turned into the streams can be installed which will remove any waste from this source entirely. I have been given to understand that the savings of one year will pay for the installing of the saveall. As to the other mills and factories, there are methods by which it can all be prevented.

"3. There are laws forbidding the polluting of any stream by dumping in any refuse that is detrimental and provision is made of this law under the direction of the board of health.

Fishways of No Value

"4. As to providing for fish gates and the effect of their absence in dams, I would call your attention to the fact that in 1916 the United States Government, in cooperation with Canada and all the fish commissions of the various states, went into an intensive investigation as to the value of fishways. It had always been considered that fish had the sense of sheep—as an instance, if there is a hole in the fence and one sheep goes through, the entire flock will follow, and people were of the opinion that if fish found a fishway and one would go over, they would all follow.

"In Wisconsin we carried on an experiment for sixty days during the months of April and May when the fish were all running up stream. The experiment was carried on at three places, which contained the most up-to-date fishways, i. e. the dam at Kilbourn on the Wisconsin River, the dam at Weyauwega on the Wolf River, and at the United States locks at Eureka on the Fox. Two men were on duty at all three places, one from six in the morning until six at night and vice-versa. A trap was built at the head of each fishway so that we would be absolutely sure as to how many fish went up the entire distance and over the top of the dam. The water was shut off at the dam, the traps were lifted and the fish that were in the fishway were counted. In a sixty day period at each of these dams and where all varieties of fish were particularly abundant, not one game fish went up the entire distance. The only fish that did go over the dam were suckers, the very fish that sportsmen do not care to get into their waters. The reason that suckers made the ascent was that they are bottom feeders and accidentally struck the entrance to the fishway and worked themselves up.

PAPER

at $4.00 a Year

Is the Biggest Value in the Paper Trade Field

PAPER

has both the best technical articles from the highest authorities in the land, and

PAPER

also has all the news of the paper industry, and in

PAPER

there is something for every man in the paper industry.

To Mr. Paper Mill President:—

Take advantage of our clubbing offer and improve the efficiency of your mill by giving PAPER to five or ten or more of your men at only $10 for each club of five. Every $10 so invested will earn the biggest interest you ever received.

PAPERMAKING EPOCHS ARE RECITED

Historical Sketch by Prof. Weston Has Much to Interest Paper Men

THE latest bulletin of the New York State College of Forestry contains an interesting historical sketch by Prof. Weston, on the development of the paper industry throughout the world. Of particular value to American manufacturers is the portion devoted to the history of the business in this country, of which the following is a digest.

America Started in 1690

Roxborough, near Philadelphia, had the of being the home of America's first paper mill. The mill was built in 1690 by William Rittenhouse, a Dutch papermaker, and William Bradford, a printer of Philadelphia. Bradford was the printer who introduced Benjamin Franklin in Philadelphia and also aided in securing employment for him in that city. Encouraged by the success of the Rittenhouse mill, a number of other mills were established in the colonies, but the production never kept pace with the demand. The first New York mill was built in 1768 at Hempstead on Long Island by Hendrick Onderdonk and Henry Remsen. It was on account of the scarcity of paper that the Journal of the 2nd Session of the New York State Assembly, in 1870, was not printed. The nearest paper mill to Albany, N. Y., at the time was located at Bennington, Vermont. The product was frequently brought from the mill on horseback and although it was very coarse and unbleached compared with papers of today, it was so valuable that every torn or broken sheet was repaired with paste. For over 100 years the very existence of the industry in this country was constantly imperiled by the scarcity of rags.

Canada in 1803

An interesting account of the history of papermaking in Canada is given in the Handbook of Canadian Pulp and Paper Industry for the year 1920. The first mill in Canada was established at St. Andrews, Quebec, in 1803, and the second at Bedford Basin, near Halifax in 1818. Both of these plants were located in what was then known as Lower Canada. The first mill in Upper Canada was erected in 1825 at Crook's Hollow. Since that time the pulp and paper industry has become one of Canada's most important industries. Statistics for the year 1920 show that there were 101 pulp mills and 67 paper mills within the Dominion.

Wood Fiber Enters

In the past, as in the present, investigators were searching for suitable raw materials. In 1800, Mathias Koop printed a book on paper he had been able to manufacture from straw and wood. According to his account it was the first useful paper manufactured solely from straw and one paragraph in the appendix reads, "The following lines are printed upon paper made from wood alone, the produce of this country, without any intermixture of rags, waste paper, bark, straw or any other vegetable substance, from which paper might be, or has hitherto been manufactured and of this the most ample testimony can be given if necessary."

He adds, "Having thus far succeeded in my researches to make a useful paper from one kind of wood, I doubt not but that I shall find many others equally eligible for the same purpose of which I trust it will be in my power, within a few weeks, to give indisputable proof that my expectations have been well founded and that I have not cherished a visionary opinion."

Such investigations proved to be the forerunner of the ground wood pulp process which was invented in 1840. The development of this process, together with the invention and development of the other wood pulp processes marked a great epoch in the history of paper manufacture. Even as late as 1874, after three of the four commonly used processes had been invented an English Journal stated that "Great endeavors had been made to introduce wood pulp as a fiber but practical papermakers deem it a failure." The dates generally accorded to the invention or introduction of the wood pulp processes other than ground wood, as used in the present day industry are:

Soda process—1854—By Watt & Burgess, in England.

Sulphite process—1866-7—By Tilghmann, in the United States.

Sulphate process—1883—By Dahl, in Germany.

Gradually these processes have been perfected and, at present, wood is our most important raw material.

As yet not every kind of wood can be successfully used for the manufacture of paper. During the year 1920, more than six million cords were used in the United States for the production of wood pulp for papermaking. Approximately 57 per cent of this total was spruce, 15 per cent was hemlock and the remaining 28 per cent was made up of fifteen or twenty other species.

Forestry or New Species?

From these figures one would conclude that spruce is our most satisfactory wood for producing wood pulp and that our supply is diminishing at a rapid rate. Such is the case, but it does not mean that wood pulp will disappear as a raw material for papermaking, but rather that forest species more difficult to utilize and now considered unsuitable will gradually come into use. The time is not far distant when scientific forestry methods will have to be adopted and practiced by concerns desiring to continue operations with the same species which they are now utilizing.

SNAPPY NOTES ON ADDING DYES TO BEATER

Much Should Be Left Up to the Foreman, Is Opinion Expressed

THE question as to whether the staining of pulp while in beater should be completed, and the proper shade for the match obtained *before* or *after* adding the size, is a matter that *Dyestuff* says rests largely upon the judgment of the foreman, and governed to some extent by the quality of paper produced.

Some dyes are not particularly influenced by the size or by any of its components. Where this condition exists and is definitely known, it is immaterial whether the dye is added to the beater before or after the size has been added. Where there is reason to believe that the dye is altered in shade by the action of the size, however so slightly, prudence and caution dictate adding the dye after the size. There is every reason for this; when the size has been added, the beater is practically finished from the beaterman's point of view, and only awaits the addition of the proper coloring matter before it is run off to the stuff-chest. If the size is already in the beater, the only concern of the foreman is to strike the desired match as quickly as possible by adding the nearest quantities of dye in solution, and bring up the shade by such further additions as experience suggests. If the size has not yet been added, there may be doubts in the mind of the foreman as to whether the exact match already obtained is likely to be thrown off its tone, or otherwise modified.

Not all beatermen follow identical methods, but it is regarded as an established fact that the majority of them add the size to the beater before adding the color. Of course, there are some colors not influenced by size; these colors are of the insoluble class, pigments and lakes, and it is immaterial whether they are added to the beater before or after the size. These insoluble colors do not actually dye the fibers as is the case with anilines; being in a state of fine division, they become distributed throughout the mass of fibers in such a firmly divided condition that they impart to the finished paper the appearance of having been actually dyed. These extremely fine particles of pigments are held in place mechanically by the action of the size, while the anilines are generally absorbed by the actual fiber substance.

Were Given Vacations

Oregon City, Oregon, employees of the Hawley Pulp and Paper Mills and of the Crown Willamette Paper Company mill across the river at West Linn, also workers in the Lebanon paper mill were given a few days' vacation during the holidays. The employees were given Christmas presents of cash and checks by the paper companies.

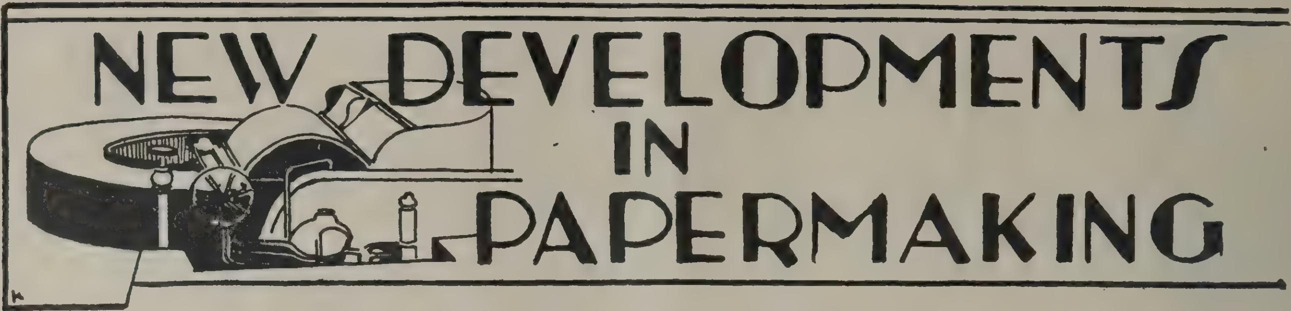
NEW DEVELOPMENTS IN PAPERMAKING



Cellulose Determination by Means of Phenol

The lognin of the wood is dissolved by heating with dry phenol, but the action is rapid and complete only in the presence of traces of mineral acids or dissociable acid salts. This reaction can be utilized for the quantitative determination of resistant cellulose provided that the hydrolysis of the carbohydrates is controlled by the careful regulation of the concentration of the acid, the time and the temperature of the heating.

The finely rasped wood material is passed through a sieve with one hundred meshes per square centimeter and then the ground product is extracted with water and acetone and then dried in an oven. Four grams of this material is treated in a test-tube, 18 by 3 centimeters, with fifty grams of dry phenol containing O.1 per cent of its weight of hydrochloric acid. The contents of the test-tube are then heated in a water bath at a temperature of 97 degrees C for a period of one hour with occasional stirring.

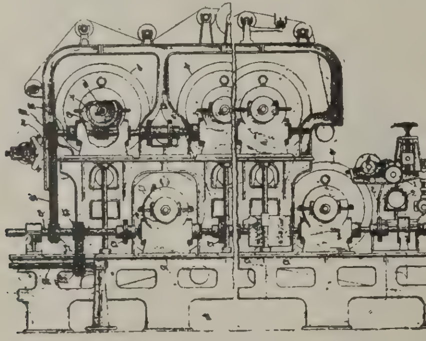
Under these conditions constant yields are obtained but the more readily hydrolyzable hemicelluloses and pentosans are attacked and dissolved, so that the yield of cellulose from spruce wood is 48.3 per cent and from beech wood 46.4 per cent.

The same method may be used for the determination of the resistant cellulose in sulphite pulp and cotton, for which materials the concentration of the hydrochloric acid should always be reduced to 0.05 per cent. The results may be corrected for the quantity of pentosan remaining in the crude cellulose. The values obtained while constant under specific conditions have no direct relation to any absolute standard and stand between those found by the Cross and Bevan method, where a minimum attack on the hemicelluloses is aimed at, and those found by the Koenig method, where the maximum elimination of the hydrolyzable carbohydrates is ensured.

For further details about this matter see Cellulosechemie, volume 4, pages 37-40.

Papermaking Machine

The papermaking machine which is patented in United States Patent No. 1,479,128 was developed by the Albany Paper Mill Machinery Co. This machine comprises a series of drying rolls having spindles and carrying gears adjacent ends of their spindles, a driving shaft extending longitudinally of this series of drying rolls adjacent to the said gears. This driving shaft carries gears meshing with the gears that are carried by the drier spindles. The accompanying illustration shows how the machine is built.

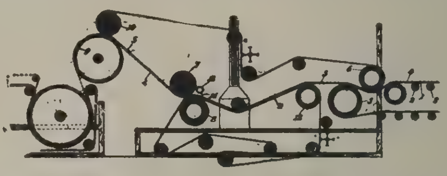


Waterproof Paper Board

Paper pulp is beaten with water at a temperature of approximately 45 degrees C with the addition of a small quantity of lime, and when the disintegration is complete, finely divided montan wax is shaken in and the beating is continued until thorough mixing is obtained. Small quantities of sodium silicate and sodium resinate are added, and after mixing sufficient alum to precipitate the lime and montan wax. From the stock which is prepared in this manner a sheet is formed in the usual way, the drying rolls being heated to a temperature sufficiently high to melt the montain wax and cause the whole to permeate through the paper structure. Preferable composite sheets are manufactured by the use of a multicylinder machine, the additional layers of paper being formed of any suitable fibrous stock. The finished sheet is preferably calendered. In the place of montan wax other hard gums or bitumens may be used. The waterproofing effect of montan wax is so great that the sheets in the composite product containing it can be made as thin as 0.002 inch, thus cheapening the whole greatly. This process is patented in United States Patent No. 1,468,959.

Papermaking Machine

A papermaking machine is patented in United States Patent No. 1,479,265. The machine comprises means of forming a paper web, upper and lower press rolls, upper and lower felt aprons passing between these rolls and adapted to carry the paper web and means located in advance of the press rolls for forcing air under greater than atmospheric pressure through the paper web. The accompanying illustration shows the essential parts of this machine.



Testing Strength of Wood Pulp

Strength tests on chemical wood pulp sheets are misleading as they are reported on import invoices. Properly felted test sheets must be made, and, if comparable results are to be obtained, the pressure that is exerted in making these test samples must be the same in each case.

The most satisfactory method, however, is to develop the papermaking qualities of the fibers by beating under standard conditions as far as it is possible to attain them and then to test the paper that is made from this stock. Experiments on a series of pulps show that the order of strength of the series as shown by the test sheets is not necessarily the same when the strength of the paper made therefrom is taken as the standard. Comparative tests on several pulps before and after bleaching show that the bleached pulp is from 50 to 100 per cent stronger than the unbleached pulp, the increase in strength being most marked in the case of the easy bleaching pulps. When converted into paper the greater strength of the bleached material is still apparent but less marked. From the figures obtained the strength of the paper made from a pulp before or after bleaching appears to decrease as the cellulose content of the original unbleached pulp increases, that is, as the cooking conditions become more severe.

For further details on this interesting subject see Proceedings of the Technical Section of the Papermakers Association. (England.)

Conducting Referendum on Bok Plan

The American Paper and Pulp Association as the only national organization of manufacturers representing an entire industry on the American Peace Award, is conducting a referendum among its members on the Bok peace plan. The ballots mailed from this Association are to represent the opinion of the paper industry, and the cooperation of the American Paper and Pulp Association has been extended merely to secure some expression of sentiment on the part of the industry. In the letter to members Dr. Baker says:

"The plan selected by the Peace Award Jury contemplates action vital to the interests not only of paper manufacturers as citizens of the United States, but to individuals and nations throughout the world. If this plan contains the solution of the present world problem, let us push it aggressively; if not, action must be started elsewhere."

Development in Papermaking Machinery

Newsprint Machines Have Been Greatly Improved—Production Accelerated by Use of Magazine Grinders—Improvements in the Slice and Use of Ball Bearing Equipment Give High Efficiency

By A. N. RUSSELL, *Engineer*

Paper Machinery Department, Dominion Engineering Works, Ltd., Montreal, Canada

> *While it is true, as brought out by Mr. Russell in the accompanying article that there have been no radical departures in the type of the original fourdrinier machine, production and efficiency have been notably increased by improvements in equipment and in auxiliary machinery. For all who wish to visualize the changes that have resulted in higher speeds and better paper a reading of Mr. Russell's paper is to be commended.*

THE necessity for increased production has been the compelling reason for most of the major improvements in paper machines and their auxiliaries in recent years, and naturally the greatest developments has taken place in machines designed for the production of newsprint papers.

The development of the modern high-speed machine has led to many improved types of auxiliary machines, all of which have played their part in the ultimate development and may be properly classed as improvements.

New Magazine Grinder Important Auxiliary

Among the more important of the auxiliary machines may be mentioned the magazine grinder which produces a more uniform groundwood pulp than was possible with the older type of three or four pocket grinders, and permits of a much closer control over the quality of this most important ingredient of newsprint papers, though the only commercially successful magazine grinder is still very similar in its operation to the pocket type with the exception that the charging of the pockets is mechanical and eliminates the human element to a considerable extent. A new and improved magazine grinder has been designed and is now being placed on the market, in which the grinding operation will be continuous instead of intermittent, as in the existing types, and excellent results in quality and uniformity of pulp have been obtained, with a lower power consumption than is possible with the intermittent type of grinder.

Self-Cleaning Rotary Screen

Another important accessory improvement which has much to do with the "safe" running of the modern machine, is the rotary self-cleaning screen, of which there are several types, the most commonly used being the inward flow, shaking vat screen. In this type of screen the screening plates form part of a slowly revolving drum, partly immersed in the stock, through which the fibers are forced by a shaking or vibrating movement applied to the vat. A continuous cleaning shower keeps the slots in the plates clean, thus attaining two important ends, namely, constant capacity and uniformly screened stock.

Important Improvements on Paper Machine

Coming to the paper machine, the more important improvements are confined to the folowing sections:—flow-boxes, slices, suction boxes, couch and press rolls, bearings, reels and driving mechanism.

Considering the slower running machines making book, writing, etc., it is no doubt true that the formation of the sheet can be controlled to a considerable extent on the wire between the slices and the suction boxes, by varying degrees and speeds of "shake," and that slight inequalities in the fiber distribution as the stock enters the slices may be corrected before the sheet is formed; but as the speed of the machine is increased it becomes increasingly difficult to make any such correction in the few seconds of time taken for the stock to travel from slice to suction boxes. For instance on a machine running at 1000 feet a minute and having an 80 ft. wire, the actual "making" length of wire would be about 24 ft. and the time taken for the wire to travel this distance would be only 1.5 seconds.

No "Shake" on Modern High-Speed Machine

Chiefly for this reason the "shake" has been abandoned on the modern high-speed machine and the greatest care taken in the design of the flow box to assure an even stock mixture flowing on to the wire. The modern flow box is designed so as to gradually still the flow of stock as it comes from the screens, and is provided with baffles of various forms to prevent side currents and surging. This is accomplished by providing a series of vertical partitions, which are spaced so as gradually to reduce the velocity of the stream, and also one or two perforated baffle boards or plates are placed between the final partitions to break up side currents and assist in securing a uniform fiber distribution in the mixture.

Straightening Out Side Currents

A recent and highly successful improvement consists of a rectifier made up of a series of thin plates set closely together and extending the full width of the flow box immediately back of the slice, which, by dividing the main stream into a series of very narrow streams, has the effect of straightening out side currents, and uniformly distributing the flow across the width of the machine.

Another recent improvement consists of a large perforated roll extending the full width of the flow box and practically filling the space between the last two partitions in the box. This roll is built of thin brass plate or tube, with large perforations, and is revolved slowly by means of a belt or other drive from the end of the breast roll, thus forming a self-cleaning baffle which greatly improves the fiber distribution without forming lumps which the ordinary perforated plates or boards are inclined to do, unless they are very carefully constructed.

New Slice Arrangement

Coming now to the slice, development has taken place along two clearly defined lines. The first is intended simply to increase the height of the standard form of plate slice so as to impart a velocity to the stock as it is placed on the wire approximately that of the wire itself, and the second the adoption of a nozzle orifice under the slice through which the stock is projected on to the wire across the gap between the breast board and the breast roll without the use of the usual apron cloth. One objection to the ordinary plate slice operating under high heads, is that it is impossible to provide a fine adjustment of the depth or orifice across the width of the machine, and another is that, owing to the sudden increase in velocity of the stock as it passes under the slice, it is difficult to obtain a smooth flow of stock on to the wire. With the nozzle form of slice the velocity of the stock is gradually increased to the point of discharge, and a series of adjustments provided to regulate the depth of the issuing stream across the full width of the machine, thus insuring a flat even discharge of stock without which it is difficult to form a good sheet at high speeds.

Suction Box Improvement

The only improvement in suction boxes or their operation in recent years, has been the means devised for oscillating or vibrating them for the purpose of preventing grooving and ridging of wire and also reducing to some extent the friction between the wire and the surface of the suction boxes, thereby increasing the life of the wire and permitting the boxes to run longer without resurfacing. This improvement has been applied to practically all modern high-speed machines with excellent results.

Roller Bearings on Couch and Suction Press Rolls

Suction couch and press rolls which were introduced some years ago and are now generally accepted as a distinct improvement over the old couch rolls, for most grades of paper, have been very much improved recently by the application of roller bearings and by other minor changes in their construction. Suction couch rolls in particular are now considered standard equipment on modern high-speed new machines, and practically all of the wide or fast machines being built today are so equipped. The fastest running and most efficient news machine are also equipped with suction first presses, and, with the improved types of bearings now in use both suction couch and press rolls rank among the most successful and efficient improvements in paper machinery.

Design and Type of Bearings

Considered as a piece of mechanism, any paper machine is simply an aggregation of rolls of various sizes and types which revolve in bearings, and the continuous and successful operation of the machine as a whole depends to a very great extent on

(Continued on page 40)

Errors in Sulphite Mill Table

Through regrettable inadvertence, the table of Sulphite Mill Calculations by W. B. VanArsdel, which appeared on page 6 of PAPER for December 27, was published before the author had an opportunity to revise the proof. As a result there are a few misprints which detract somewhat from the value of the table. Corrections should be made as follows:

In the 8th line of "Gas Volumes,"

$R = 0.08204$, not 0.08024.

In the 1st line of "Constants,"

Loge, not Logo; x, not X; $\sqrt{2g}=8.025$ goes on a separate line; the square-root sign should extend over the quantity 2g.

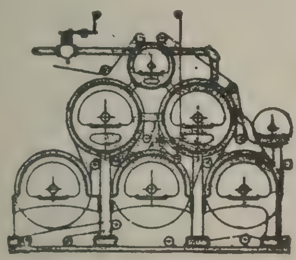
Readers are asked to make the foregoing corrections.

Resigns from American Writing

Edmund E. Keough has resigned as Advertising Manager of the American Writing Paper Company, to become Sales Promotion Manager of the Paper Utilities Co., of New York City, manufacturers of the Tulip Drinking Cups and a wide range of Paper Specialties.

The Pickles Drying Regulator

Reasons why you should have it on your machine are: First, it regulates the drying of paper automatically, irregularities are eliminated; second, higher machine finished papers are attainable, because it is possible to maintain the proper quantity of moisture in sheet, as it passes to calenders; third, mills having tried it on one machine have ordered it for all their machines. Full particulars upon application to



W. F. PICKLES - Buckland, Conn.

ORR FELTS and JACKETS

Lowest Cost per Ton

If you judge felt values, not by what you put into the equipment, but what you get out of it—then you will specify ORR 3 stripe Endless Felts for ORR felts will produce the lowest cost per ton. They "stand up" under severe usage. Orr durability is acknowledged everywhere. Their strength and long life are as dependable as their reliability and quality.

In the 32 grades of Felts and Jackets we can match your most exacting demands. Tell us the kind of paper you desire to make, and we will send you samples of felts that will economically serve you and help you to produce paper at lowest cost per ton.

COLONEL HASKELL DIES IN CALIFORNIA

Was One of Organizers of Great Northern Paper Company

COLONEL EDWARD H. HASKELL, one of the most prominent paper manufacturers of New England, died January 9 at Pasadena, Cal. In the paper trade he was best known as a director of the Great Northern Paper Company. In addition he was president of the Haskell-Dawes Machine Company and president of the Hastings Lumber Company. His Boston offices were at 176 Federal Street and his home was at 888 Beacon Street, Newton Center, Mass.

He was one of the organizers of the Great Northern Paper Company, was chairman of the board of directors for some years and had always been, up to the time of his death, a director. He organized the Rumford Falls Paper Company at Rumford Falls, Me., which afterwards was sold to the International Paper Company. He had gone to Pasadena after having spent several months in the Canadian Northwest looking aver timberlands and on December 30 was joined at Pasadena by his wife. They had planned to spend three or four months in Pasadena before returning to Boston.

Born in Gloucester, Mass., Oct. 5, 1845 and served in the War of the Rebellion in Company C of the Twenty-third Regiment. At the close of the war he engaged in the newspaper business but soon left that business to engage in paper manufacturing and at the time of his death was one of the leaders in that industry.

He was president of the Press Paper Trade Association, vice president of the Boston Associated Boards of Trades, president of the Essex Club of Massachusetts, president of the American Baptist Home Mission Society, vice president of the Home Market Club and a member of scores of social, religious and philanthropic organizations.

He represented Gloucester in the Massachusetts Legislature in 1878, served as adjutant general of that state for three years under Governor John D. Long, served as a member of Governor Benjamin F. Butler's council in 1883 and in the same capacity in Governor Robinson's council in 1885. He was very active in Grand Army circles, and was a member and past commander of Charles Ward Post and had served in various financial offices of the Massachusetts Department and National G. A. R. bodies. He had supervised many campaigns for the raising of funds for the Grand Army.

In Baptist circles he was long a leader. In 1919 he presented a modern gymnasium to the Shanghai Baptist College and Theological School and had many times visited China in the interest of the Baptist organizations, in 1901 going as the New England representative to the 11-day missionary conference at Shanghai. He was also largely interested in the American Girls' College at Constantinople and had been a frequent visitor there. During his recent visits there he had charge of several buildings which were under construction.

He had given generously to many charities. He gave over $150,000 to the New England Baptist hospital in Boston and at the time of his death was constructing, to present to the hospital, a nurses' home on Parker Hill. He also participated in many national republican campaigns and in 1880-1884 was secretary of the Republican National convention.

He is survived by a widow, Mrs. Harriett J. Haskell; two daughters, Marion R. and Edith I. Haskell of Newton Center, Mass., and a son, Edward A. Haskell of Braintree, Mass.; also by a brother, Charles A. Haskell of Newton, Mass.

Funeral services were held January 11 at Pasadena with Rev. O. P. Gifford of that city, formerly of Boston, Mass., officiating. The body will be brought to Boston in the spring for burial.

Development in Papermaking Machinery

(Continued from page 38)

the design and type of bearings employed. Until the era of high speed operation almost any kind of bearing was considered good enough for a paper machine, but the modern machine calls for the very best types of bearings that can be designed for their particular location and purpose. For the wet end, **self-aligning, grease lubricated,** waterproof bearings, or very carefully housed ball or roller bearings have been designed by most modern machine builders, and for the dry end, collar, or ring oiling bearings carefully designed to retain oil and exclude dust, have been generally adopted with a great resulting economy in lubricant and power.

Ball Bearings Non Essential

Several machines have been ball-bearing equipped throughout, and have given remarkable results in saving of power, and a large number of machines have all the small rolls such as press and dry felt rolls so equipped, but as ball bearings require very careful attention, if the best results are to be obtained—particularlv on the fourdrinier sections of machines, where water conditions make their use hazardous —they have not been generally adopted by the modern machine builder.

The importance of the bearings on a paper machine has grown tremendously in recent years, due not only to the increased speed at which machines operate, but also to the greatly added weight of the various rolls on account of the widths of the modern machines, and it may safely be said that the most successful machines today are those with the most carefully designed and constructed bearings.

Pope's Carrier

The mechanical leading and transportation of the paper over a paper machine has been largely responsible for successful operation at high speeds, and much credit is due the late Mr. Elmer Pope for the introduction of the compressed air devices now so universally used in leading paper through the presses and other sections of the paper machine.

The Sheahan rope carrier as a means for transporting the paper through the dryer section also ranks as an improvement of far reaching importance, and is now practically standard equipment on fast machines.

Improvements in Paper Winding

Improvements in reels made in recent years have been practically confined to the "Uniform Speed" type of which the most notable is the "Pope" patented reel. In this reel paper is wound on pipe rolls by direct contact with a large revolving drum, and the special feature of the machine which gives it a great advantage over other uniform speed reels is that all reels are started on the side next to the calender and then the roll on which the paper is being wound is transferred forward to a second pair of supports where the reel is finished. In this way a new reel is always started back of the finished reel and the change can be made by means of an air jet with a minimum of waste in time and paper.

Sectional Drives

The necessity for careful speed regulation of the paper machine as a whole, and of the various sections in their relation to each other becomes increasingly important as the speed of the machine increases and the introduction of the sectional electric drive has done much to solve this problem in connection with high-speed newsprint production. There are now several types of sectional drive on the market, and in successful operation, which consist of either a motor generator or a turbo-generator set, a D. C. motor for direct driving on each unit, or section, of the paper machine and some form of mechanical or electrical interlock or control by which a very close speed regulation can be maintained between the various sections. Several of these sectional drives have been in use for nearly three years on high-speed news machines, and have no doubt been largely responsible for the high efficiency and safe running of these machines.

The modern high-speed paper machine is a most complicated and expensive piece of machinery, and it will no doubt be simplified and improved as time goes on, but up to the present, there have been few radical departures from the original fourdrinier, except in point of size and weight. So much has been done in the way of improvement in recent years however, that it is unsafe to predict what the future may hold in the matter of simplification of the paper machine.

HEARST PAYS $750,000 TO END SUIT

Campbell Brothers Retain Control of the Dexter Establishment

THE litigation between Campbell Brothers, owners of the Dexter Sulphite Pulp and Paper Company mill, and William Randolph Hearst, involving the sale of a paper mill for $3,500,000 in Dexter, N. Y., has been settled through a substantial money settlement by Hearst. Campbell Brothers retain the mill.

The publisher sought to have set aside a contract whereby he agreed to purchase the paper mill for $3,500,000. Appearing in court Mr. Hearst alleged that he was induced to agree to pay a sum far in excess of the value of the mill and without knowledge that a $500,000 commission was to be split among Charles F. Zittel, his agent and also publisher of a theatrical magazine, and others.

It was said that Mr. Hearst had paid the Campbell Brothers in the neighborhood of $750,000. This was said to represent only a bill he owed for paper stock and for six months' use of the mill, an obligation he was said to have acknowledged from the start. The Campbell interests in turn rescinded the contract by which the publisher was to have purchased the mill property.

Assistant Paper Maker Wanted

Receipt of applications will close February 12. The examination is to fill vacancies in the Bureau of Standards, Department of Commerce, at entrance salaries ranging from $1,200 to $1,400 a year, plus the increase of $20 a month granted by Congress, and vacancies in positions requiring similar qualifications.

The duties are to assist in the operation and maintenance of the experimental paper mill of the Bureau of Standards.

Competitors will not be required to report for examination at any place, but will be rated on their physical ability, and education, training, experience, and fitness.

Granted Charter in Delaware

The Fibo Pak Company, manufacturers of fiber board boxes, has been incorporated in Delaware with $10,000 capital. It is located at Wilmington, Delaware.

Manufacture of Pulp and Paper

Volume IV Now Ready

Prepared by the Joint Committee on
Vocational Education of the Pulp and Paper Industry

Although it was promised as a Christmas present we have this much desired book for a New Year's gift. The fact that the date of publication on the title page is 1924 goes to show that the editor was promising more than he could perform. However, we have the book and will make a good start for the new year by reading it. Perhaps its advent will stimulate many of those who have the third volume in their bookcases to read it as well.

It is a book of 527 pages divided into six sections as follows:

Section 1. Preparation of Rags and Other Fibers, 62 pages, 19 illustrations, by E. C. Tucker.
Section 2. Treatment of Waste Papers, 72 pages, 21 illustrations, by E. T. A. Coughlin.
Section 3. Beating and Refining, 80 pages, 32 illustrations, by A. B. Green, with a Bibliography of 6 pages by C. J. West.
Section 4. Loading and Engine Sizing, 49 pages, 14 illustrations. Loading by Ross Campbell and Engine Sizing by J. A. DeCew.
Section 5. Coloring, 54 pages, 4 illustrations, by the Dyestuffs Committee of TAPPI in collaboration with Otto Kress.
Section 6. Papermaking machines, 210 pages, 83 illustrations, by J. W. Brassington.

In addition to the authors the editor and the committee in charge of the preparation of the work credit a long list of companies and individuals for helpful service and advice.

All that was said of the third volume covering the Preparation and Treatment of Wood Pulp may be repeated. Its successful accomplishment is unique as it represents the co-operative effort of the paper industry of a whole continent. Never have such care and expense been devoted to the preparation of an industrial work of instruction and reference.

Each section after being written, was examined and criticized while in manuscript by several competent authorities. The book is in fact the work of more than one hundred men prominent in the industry.

When the final volume of the set, now well advanced, is completed it would be difficult to exaggerate the importance of the achievement to extend too much praise to the editor-in-chief, J. N. Stephenson.

The four volumes issued are on sale at $5 a volume and orders may be placed through

Paper and Board

New York, January 15—Moderate activity in the paper market in New York was reported last week. While business was principally of retail scope, there was improvement recorded in the demand for most kinds of paper, and the market exhibited more life than at any time since prior to the holidays, consumers coming into evidence as buyers in large number and showing greater interest in covering what appeared to be expanding requirements.

Reports continued to tell of a somewhat soft tone in prices of most kinds of paper. It was apparent that manufacturers were in want of business, that they lacked enough orders to warrant anything like full productive operations and that they were satisfied to grant some concession in prices when to do so resulted in buyers placing orders. At the same time there was no important fluctuation in quoted prices. Mills maintained their quotations, and nominal market levels therefore were unaltered, though it was no secret purchases were made at below the rates named by producers.

The national automobile show in New York occasioned a sharp increase in newsprint consumption in this city. Having a large volume of automobile advertising, all of the newspapers in the metropolis added pages to every issue they printed during the week, and probably a larger tonnage of print paper was used locally than in any week in a long time. This served to instill more strength into the newsprint situation, and prices ruled firmer than ever but of course there was no change in contract rates.

No less an authority than Philip T. Dodge, president of the International Paper Company, forecasts a prosperous and active year for the newsprint industry during 1924. In a statement Mr. Dodge said: "If I read the signs of the business sky aright the demand for newsprint will be strong throughout the greater part of the year. This should spell prosperity for the papermaking industry. It should also mean steady and profitable employment for all those who derive their living from this great industry.

"But risk is of the essence of business. It doesn't pay to be too sure. The unexpected so often happens. It is best to make allowance for the fact that the future may not be as bright as it looks and to so organize your affairs that even the shock of adverse conditions cannot disturb you greatly."

Demand for book paper continues rather limited, that is demand from transient sources. The contract movement of paper of this class is good, very nearly if not entirely normal, in fact, but mills require a broader demand from transient quarters to justify larger operations. Keen competition exists in the book paper trade. Manufacturers are shading prices to secure orders, and consumers, having found they can buy at reduced prices, are invariably looking to cover their wants at figures a little below recognized market levels. Machine finished paper is quoted at about 6.50 cents a pound f. o. b. New York, but sales at less are reported, down to 6 cents being mentioned in the trade.

Wrapping papers are also in anything but a firm price position. Some shading of prices of this kind of paper is being resorted to in an attempt to stimulate demand, and buyers are securing some supply of No. 1 domestic kraft wrapping down to 6 cents a pound f. o. b. New York. Other coarse papers, bag paper in particular, are fairly steady in price and marked by a moderate demand.

Box board demand is slow. Mills in the East are running on curtailed schedules and even so are experiencing trouble in finding an outlet for all of their production. Paper box manufacturers are not in a buying mood; the only time they purchase is when pressed by want of supplies, and then they limit orders to hand-to-mouth lots. Prices are slightly easier, plain chip board selling in at least some cases down to $45 per ton f. o. b New York and news board at $50. Single manila lined chip board is quoted at around $67.50 a ton New York.

Athens Implement & Manufacturing Co.
ATHENS, Wis.

Mechanical Pulp

In some quarters lower prices are reported ruling on ground wood. Foreign pulp on the spot at New York and other American Atlantic ports is said to have sold at as low as $31 a ton ex dock though this price is regarded generally as a little under the market level, around $33 being viewed as a more representative value of imported ground wood. Domestic mechanical pulp is holding at about $40 a ton, or slightly less depending on the freight to consuming points, f. o. b. grinding mills. There is a fairly good demand for ground wood. Newsprint manufacturers are not only using most of the pulp they produce themselves but are frequently coming into the market to acquire additional supplies. It is felt moreover that as the weather becomes colder and grinders are handicapped in their operations prices will stiffen, if not show a considerable advance.

Foreign and Domestic Chemical Pulp

Sales of chemical pulp have been reported indicating that prices are hardening and that market levels are gradually, though surely, moving upward. Demand continues of limited scope. Papermakers are buying chiefly to cover direct and actually known requirements, and most of the transactions involve comparatively small amounts of pulp, yet there is decided improvement in the market undertone and everything would seem to point to prices having started on the upgrade after having moved in the other direction for a prolonged period.

Foreign unbleached sulphite has sold as 2.65 and up to 2.75 cents per pound ex dock New York though some supply is reported still available at lower prices than these. Importers quote No. 1. foreign kraft pulp at around 2.65 cents ex dock New York, with very little or no supply any longer to be had at the bottom level of 2.50 cents reached by the market thus far. Domestic pulps tend to strengthen in value and the entire complexion of the market is improved. Quotations ex dock New York and f o b. pulp mills are:

Sulphite foreign—			
Bleached No. 1..	4.00	@	4.50
Unbleached No. 1.	2.65	@	2.80

Kraft, foreign	2.50	@	2.75
Kraft, domestic	2.75	@	3.00
Sulphite, screenings, refined	1.75	@	2.00

Domestic Rags

Papermaking rags are in a firm market position and prices are on the rise. Demand is unusually good for this period of the year, and dealers put much stress on the small amounts of rags coming in form collecting sources, and use this as an argument for higher prices. Low grades as consumed by roofing paper mills are especially strong, with sales of No. 1 roofing stock reported at 2 cents a pound or very close to that figure f. o. b. New York, and of No. 2 grade at 1.70 cents New York. New cuttings are tending upward , particularly certain grades which are in small supply. Blue overall cuttings are bringing 9 cents a pound f. o. b. New York, No. 1 white shirt cuttings 13.50 cents, unbleached muslins 11.75 cents, and washables 5.50 cents. Old thirds and blues are firm and in steady demand at 3 to 3.25 cents a pound at shipping points for repacked and around 2.50 cents for miscellaneous packing. F. o. b. New York quotations follow:

New Shirt Cuttings,			
No. 1	13.50	@	14.00

Imported Rags

Practically all grades of foreign rags are in good demand and strong in price. Dark colored cottons are fetching 1.75 cents per pound ex dock New York, and are selling in good-sized quantities to numerous roofing paper mills. Old blue cottons are firm at 3.25 cents ex dock New York for German rags and higher for blues from other European countries. New light prints are quoted at 7 to 7.50 cents a pound on the dock. Quotations on ex dock New York basis are:

Roofing Bagging ..	.95	@	1.00				

Old Paper

After ruling quiet and easy over the holiday period, the old paper market has started to show more life and there has been a stiffening process in prices of some grades, notably the low qualities used by board mills. Folded news is selling at 85 to 90 cents a hundred pounds f. o. b. New York, and some dealers are hesitant to do business at less than the higher figure, while No. 1. mixed papers are slightly higher in price at 65 to 70 cents a hundred New York. Old kraft is firm at 2.15 to 2.25 cents per pound f. o. b. New York, and while blank news is selling at 2.25 to 2.35 cents. Old magazines are relatively quiet but are holding in price at 1.50 to 1.75 cents, depending on the quality of packing, f. o. b. New York. Shavings are also quiet but no change has developed in quoted prices. Quotations on a f. o. b. New York basis are:

No. 1 Hard White Shavings	3.80	@	4.00	Kraft No. 1	2.15	@	2.25
No. 2 Hard White Shavings	3.25	@	3.50	New Manila Cuttings	2.00	@	2.25

Ledger Stocks	1.00	@	2.10	Common Paper	.40	@	.45

Twines

There is a firm tone to twine prices, due more to the strength in raw material than to any unusual demand from consuming quarters. Fibers of all descriptions are gradually rising in cost, and manufacturers, while endeavoring to keep quotations on their product stabilized, say prices must advance if raw stock continues to soar. Quotations are approximately as follows:

Sisal Hay, pure ...	12.25	@	13.25	Jute Wrapping twine, A grade	19.00	@	
Manila Hay, pure..	16.25	@	17.25	Papermakers Twine.	10.50	@	
Sisal Lath Yarn ..	11.25	@	12.25	B. C. Hemp, 18 ...	.39	@	.40
Manila Rope, pure, ¾ inch diameter.	14.25	@	15.25	B. C. Hemp, 24 ...	.38	@	.39
Hardware Rope	11.25	@	12.25	B. C. Hemp, 36 ...	.37	@	.38
Jute rope, ¼ diam. and over, coils ..	12.00	@	14.00	America Light India— No. 6	14.50	@	
Sail twine, A grade.	19.00	@		No. 7	13.50	@	

Chemicals

The contract movement of papermaking chemicals keeps up in good volume but fresh demand is slow to develop. Quoted prices are maintained at last reported ranges without any changes of consequence.

Charles M. Dennison Dead

Charles Melville Dennison, Jr., head of Dennison and Sons, Inc., manufatcuring stationers of New York and the organizer of the Rocky Mountain Bank Note Company, doing business at Denver, Elpaso, Pueblo and Salt Lake, died at his Denver residence December 31 after a long illness.

Mr. Dennison, who was born in Brooklyn, N. Y., July 3, 1873, started his business career with Dennison & Brown, manufacturing stationers of New York, the firm started by his father in 1869, and now known as Dennison and Sons, Inc. He was a member of many clubs in Denver and Colorado Springs, and is survived by his widow who was Miss Helen I. Stuart of Bangor, Maine, the couple marrying thirty years ago, have four children. His mother, two brothers and sister also survive.

William H. Lowe, general manager of a number of divisions of the Paraffine Companies, Inc., San Francisco, Cal., has returned from a three months' trip abroad, the majority of time being spent in England and France.

IMPORTS AT NEW YORK

Week of January 7-12

Paper

Str. Canada, Lisbon—Zorro Tobacco Company, 12 cs. cigarette.

Str. President Wilson, Trieste—Publicity Paper Corporation, 32 bls. printing; J. P. Heffernan Paper Company, 69 bls. wrapping; New York Trust Company, 108 bls. and 269 rolls wrapping; Order, 12 cs. cigarette and 637 rolls and 15 bls. wrapping.

Str. Hague Maru, Kobe—H. C. Davidson & Co., 8 cs.; Order, 3 cs.

Str. Tarantia, Glasgow—P. D. Winter, 42 bls.; Blauvelt-Wiley Paper Mfg. Company, 63 bls. wrapping; R. Wilson Paper Corporation, 10 cs.

Str. Alberta, Trieste—C. W. Williams & Co., 145 bls.

Str. Drottningholm, Gothenburg—Japan Paper Company, 3 cs.; D. S. Walton & Co., 818 rolls wrapping; National City Bank, 8 bls. wrapping; M. Gottesman & Co., 132 rolls newsprint; Newsprint Paper Corporation, 142 rolls newsprint; Wilkinson Bros. & Co., 22 bls. wrapping; Central Union Trust Company, 62 rolls newsprint; O. M. Baxter, 73 cs. wall board; J. P. Heffernan Paper Company, 360 bls. wrapping; Bernard, Judae & Co., 5 bls.; Federal Commission Company, 1 cse. hanging; Arkwell Safety Bag Company, 194 rolls wrapping; Order, 83 rolls newsprint.

Str. George Washington, Bremen—A. Frankan & Co., 5 cs.; Perkins-Goodwin Company, 23 rolls printing; Miller, Likeritz & Co., 4 cs.

Str. Laconia, Liverpool—F. J. Emmerich & Co., 4 bls. hanging; F. C. Strype, 16 cs. tissue.

Str. Lapland, Antwerp—C. W. Williams & Co., 15 cs.; A. C. Dodman, Jr. & Co., 6 bls. hanging; P. C. Zuhlke, 83 cs. printing; Irving Bank-Columbia Trust Company, 12 cs. parchment; Bernard, Judae & Co., 1 cse. wrapping; from Rotterdam—Japan Paper Company, 7 cs.; Republic Bag & Paper Company, 2,071 rolls wrapping; Publicity Paper Corporation, 807 bls. and 2,173 rolls wrapping; Steiner Paper Corporation, 24 bls. wrapping; Wilkinson Bros. & Co., 14 bls. wrapping; Irving Bank-Columbia Trust Company, 30 bls. and 8 rolls wrapping; National Paper and Type Company, 19 cs.; American Exchange National Bank, 591 rolls hanging; International Mercantile Marine Company, 7 cs.; Safran & Co., 24 bls. wrapping.

Str. Pipestone County, Havre—Standard Products Corporation, 102 cs. cigarette; F. P. Gaskell & Co., 30 cs. cigarette.

Str. Majestic, Southampton—F. J. Emmerich & Co., 13 bls. hanging; A. C. Dodmon, Jr. & Co., 10 bls. hanging.

Str. Mississippi, London—H. Reeve Angel & Co., 3 cs. drawing and 3 cs. filter; W. H. S. Lloyd & Co., 59 bls. hanging; F. J. Emmerich & Co., 6 bls. hanging; Order, 2 cs. drawing.

Str. Meuchen, Bremen—A. Frankan & Co., 4 cs.; Globe Shipping Company, 154 cs. photo.

Str. Suffren, Havre—Standard Products Corporation, 26 cs. cigarette; Judson Freight Forwarding Company, 1 cse.; Globe Shipping Company, 1 cse.; American Express Company, 4 cs.; Dupont Cellophane Company, 18 cs.; Gluckman & Starich, 4 cs.; Whiting-Patterson Company, 8 cs. hanging; Japan Paper Company, 2 cs.; Order, 4 cs.

Wood Pulp

Str. President Wilson, Trieste—E. Neumberg & Co., 2,218 bls.

Str. Drottningholm, Gothenburg—Johaneson, Wales & Sparre, 1,150 bls. sulphite; Parsons & Whittemore, 400 bls. sulphite; Castle & Overton, 600 bls.; National City Bank, 353 bls. soda; International Acceptance Bank, 1,250 bls. sulphite; Order, 1,250 bls. sulphite.

Str. George Washington, Bremen—R. F. Hammond, 1,200 bls.

Str. Bornholm, Windsor, N. S.—Tidewater Paper Mills Company, 12,300 bls. ground wood.

Str. Muechen, Bremen—Castle & Overton, 406 bls.; H. Hollesen, 4,087 bls.; Bulkley, Dunton & Co., 500 bls. sulphite; American Woodpulp Corporation, 374 bls.

Old Rope

Str. Chicago City, Bristol—Brown Bros. & Co., 149 coils.

Str. Tarantia, Glasgow—International Acceptance Bank, 61 coils.

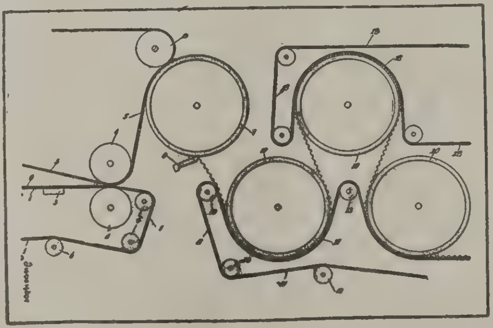
Improved Process of Creping Paper

The Best and Most Profitable

For the manufacture of CREPED PAPER Napkins, Toweling or Stretchable Bag Papers and Creped Packing or Crepe Wrapping Papers the system has no equal



The crepe being formed while the fibres are steaming hot and pliable is dried without stretching; not only retaining form better, but shedding less lint than cold creped paper products.

CARTHAGE SULPHITE HAS LOST NEARLY $300,000

Claims Against Company Total $1,000,000 According to Statement

IN the last two years the Carthage Sulphite Pulp & Paper Company of Carthage, N. Y., has lost nearly $300,000, it was learned from a reliable source following the creditors' meeting at Carthage last week, when it was decided to ask Judge Frank Cooper in Federal Court at Albany to name a receiver in equity for the company.

The names of Attorney Charles E. Norris of Carthage and J. Victor Baron, president of the Sulphite company for the past year, will be suggested to Judge Cooper. Prospects now are, in the opinion of paper mill men, that the receiver will be Mr. Norris.

The actual request for a receiver will be made in court by attorneys for R. F. Hammond, Inc., New York importers of pulpwood, and by counsel for other creditors.

Since the receivership is to be in equity there is a slight legal distinction between the present state of the Sulphite Company and actual bankruptcy. Creditors, however, will be paid pro rata on their claims, as in a bankruptcy case. Just how much on the dollar the company can pay is not known, but an unofficial estimate placed the amount at 30 cents.

Local creditors of the company include prominently the Northern New York Utilities, Inc., and Mark S. Wilder, president of the Diana Paper Company.

It has been known among paper mill owners for some time past that the Carthage Sulphite was in financial straits.

Retained by Railroad

Julius H. Patrick, for four years past employed as office manager of the Hinde and Dauch Paper Company has just been retained as auditor for the Norwood and St. Lawrence Railroad Company. The work is handled at the offices of the St. Regis Paper Company in the Trust Company building.

Mr. Patrick has devoted practically his entire life to office work in paper manufacturing companies. He was formerly 12 years with the Dexter Sulphite Pulp and Paper Company, then six years with the Malone Paper Company, six years with the Island Paper Company at Carthage, before coming to the position with Hinde and Dauch Paper Company. He is regarded as an expert at his profession.

LORD BEAVERBROOK MAY BUY PAPER MILL

Ostensible Came to Canada to Purchase String of Newspapers

WHEN Lord Beaverbroog stated to Canadian correspondents that he was not here to purchase a string of Canadian papers, he did not deny that the purpose of his mission was to purchase, if possible, a series of Ontario pulp and paper mills. It is current report in Toronto that Beaverbrook has been negotiating with the Spanish River Pulp and Paper Mills, Limited, for their purchase of their plant and limits, and learning this other pulp and paper concerns are reported to have entered into negotiations with Beaverbrook to protect their interests against a possible merger. Last week E. W. Backus, the millionaire pulp and paper operator of Minneapolis and Fort Frances, Ont., was in Toronto, and it is stated that he carried on telegraphic conversations with Lord Beaverbrook in New York. Beaverbrook's major pulp holdings are in Quebec. The head office in Toronto of the Spanish River Pulp and Paper Mills denies all knowledge of the negotiations.

ST. REGIS BUILDING IS DEFINITE

Floyd L. Carlisle Makes Definite Announcement in Matter

THE St. Regis Paper Company, within the next twelve months, or as soon as plans now being worked out can be mrought to completion, will build a newsprint paper mill in Canada.

This announcement was made definitely by Floyd L. Carlisle, president of the St. Regis and head of the affiliated power, paper and financial interests commonly called the Carlisle group. His statement followed unofficial publication, under a Quebec date line, of a despatch saying that the St. Regis proposed to put up a $4,000,000 mill near that city.

"The new mill," said Mr. Carlisle, "will in all probability be built on the St. Lawrence in the parish of St. Augustin, about eight miles from Quebec. Its initial capacity will be 100 tons, but as time goes on and the necessity for greater production increases, the capacity will be enlarged until eventually we may be operating a plant turning out 1,000 tons of newsprint every 24 hours.

Pulpwood for the mill will be transported by water from the timber tract on the Godbout River now owned by the St. Regis, which has a 200,000 acre tract in that section. This tract lies a 24-hour trip by water away from Quebec. The St. Regis holdings in Canada, which include some 50,000 acres aside from its Godbout land, are feehold.

Power to operate the Canadian mill of the St. Regis will have to be purchased, since none is available from the St. Lawrence. Mr. Carlisle said negotiations for this power are now in progress, but would not indicate from what source the power would actually come.

The -4,000,000 set in the despatch at the cost of the mill, he said, was not exact.

Control of the mill will be in the hands of the St. Regis Paper Company of Canada, which has the same officers as the American concern, but which heretofore has been only a lumbering firm, cutting and shipping to St. Regis mills here pulpwood from the company's Canadian tracts.

Establishment of a mill by the St. Regis in Canada, Mr. Carlisle made plain, will in no way affect the plants now operated in the United States.

"We shall continue to make paper at our mills on this side of the border as long as is practicable," he declared. "By that I mean that so long as we can get pulpwood here and sell newsprint at a reasonable profit the American mills will be run as they are at present."

News that the St. Regis had finally concluded to enter the Canadian field in the manufacture of newsprint did not come as an altogether complete surprise to paper circles here. For years it has been an open secret that eventually the St. Regis would build a news mill across the border. In Canada lies the great areas of timber which may be converted readily into pulp, and the cost of transporting this pulp to the United States has mounted steadily. Also, the rate of pulp has gone up in the same ratio.

The St. Regis now owns and operates mills at Deferiet, Herrings and Black River. At Norwood, Norfolk and Raymondville are the mills of the Hanna Paper Corporation, which for all practical purposes is identical with the St. Regis. The powers at these mills are owned by the Power Corporation of New York, one of the Carlisle companies. The purpose of forming the power company was to convert mechanical power at mills into hydro-electric powers, selling surplus current to the Northern New York Utilities, Inc. Such conversion is now going on at Herrings.

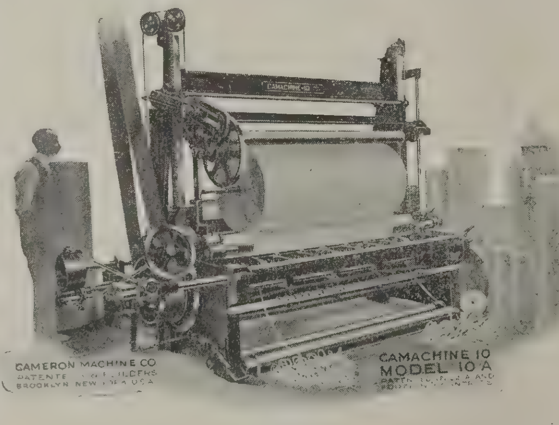
UNIVERSAL



Of universal application to the needs of wholesale paper warehouses, paper dealers, paper converting plants and paper mill finishing rooms is CAMACHINE Universal Type 10 Model 10A, illustrated here. This machine is built in widths 42", 52", 62", 72" and 82" and will wind rolls to a maximum diameter of 36". Descriptive literature covering this and others of the complete line of Camachines, which cover every roll requirement, will be sent on request.

The Magazine for the Paper Industry

THOMAS J. KEENAN, F.C.S., Technical Editor RUSSELL C. HUGHES, Publisher ISMAR GINSBERG, B.S., Contributing Editor

What PAPER Must Be To Succeed

WHAT should a trade paper be? What should it consist of, what should it seek, what should its ideals be?

It causes a publisher to ponder seriously. What should PAPER be?

We would like your ideas. Ours is that it should be a literal reflection of the industry it represents. Besides it must have the personal tone and intimate touch.

Any successful trade paper must be broad-minded and free from subservience to any particular interest within the industry. It must view the industry as a whole and hence it cannot seek the level of personal interests and biased opinions.

A successful trade paper must be non-political as to parties but the strongest partisan it possibly can be as to its industry. It must be free to exert its influence in favor of those things which work for the industry's advancement and against those which would injure it. It should be impersonal and unfettered and should be free from all entanglements with personal interests, petty bickering and internal strife. Its axiom must be "All for the industry and the industry for all."

Moreover, a successful trade paper must be more than a chronicle of passing events, although these should be a large part of it. It should write "service" in every page it prints and in its heart. It must be both an encyclopedia and an inspiration to its readers. It must be both a leader and a servant.

A successful trade paper must be fair in its criticisms, constructive and not destructive, free from malice and personal abuse. But it must be fearless, unafraid to speak that in which it has faith, but always willing to meet any opponent in a fair field of open discussion. It must admit its errors and always keep in mind that there are two sides to every opinion and to every problem.

A successful trade paper must consider its advertisers, but it must not be swayed from the paths of its duties to the industry by those advertisers, large or small, who seek to capitalize its columns. For it must remember that the biggest rock it can stand on is character. It cannot trifle with its prestige.

And a successful trade paper must be original. Too much rehashed food is palling. It must seek progress for itself through progress for the industry. It should seek contributors of all kinds in its trade. It must have something to interest every worker in that trade. It must attract attention.

Above all, accuracy must be the prime requisite. Every line in it must be authoritative. The words "I saw it in PAPER," must mean that that one thing is an established fact.

Moreover, a successful trade publication will be practical. It cannot enter too much into pure experiments. It cannot soar too high into the ethereal. It must be of the earth, earthy. The reader must know not simply what the other fellow did, but why and how he did it.

A trade paper must inform. Its readers take other periodicals for most of their entertainment. They take their trade paper to learn. Its presentation must be attractive but it should not aim for beauty at the expense of information. Its columns should be concise, condensed, tabloid. They should serve much in little.

A successful trade paper must be for both sides, regarding employer and employee. It should be more interested in collective usefulness and against collective bargaining. It should treat both fairly and honestly. It must always maintain its equilibrium.

A successful trade paper must look ahead. It must peer into tomorrow, so that its readers may glean an idea of what is coming. Yesterday's events are of no value unless they can be applied to tomorrow's needs. A trade paper must keep abreast with science or it may as well die.

These are what we think PAPER should be.

What do you think?

The De Vains Process In Detail

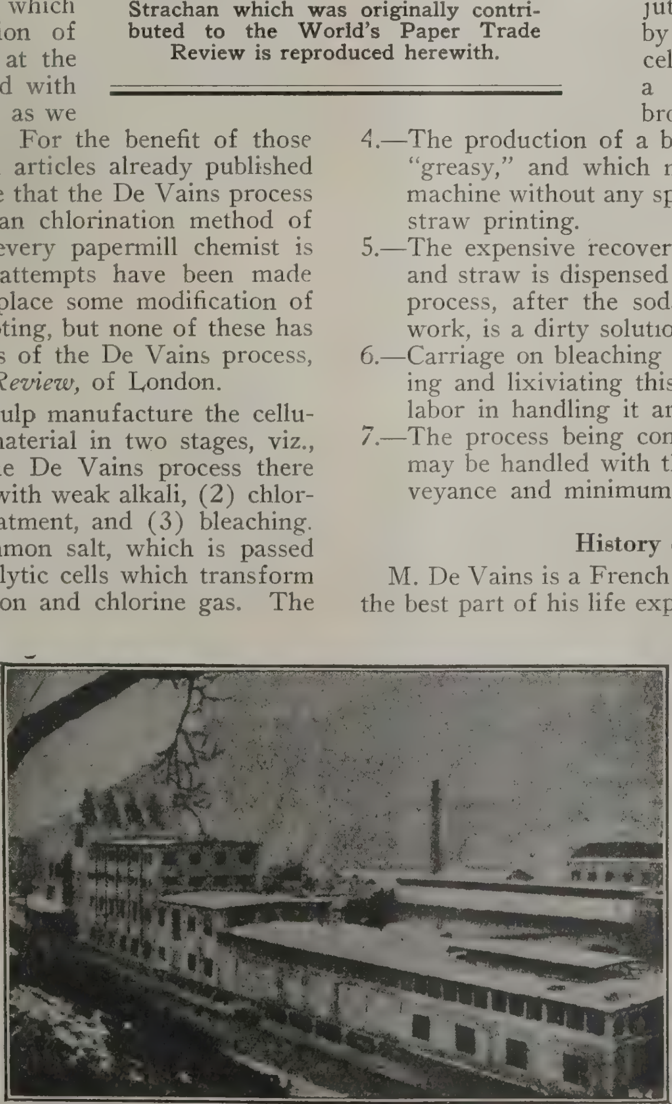
New Method of Isolating Pure Cellulose from any Fibrous Raw Material Is Explained In Detail By An Authority

By JAMES STRACHAN,
Donside Paper Mills, Aberdeen, Scotland

The De Vains process for the manufacture of bleached pulp is attracting great attention. Its development is being watched with intense interest by pulp manufacturers everywhere. PAPER has already received a number of inquiries concerning the future possibilities of the process and the technical editor of this journal is keeping in close touch with the backers of the De Vains process in Europe. A communication on the subject by James Strachan which was originally contributed to the World's Paper Trade Review is reproduced herewith.

SEVERAL articles have already appeared dealing with the De Vains process for the manufacture of bleached pulp or the commercial isolation of pure cellulose for papermaking purposes. From some conversation I have had with papermakers in this country the general impression created by these publications is, firstly, that there is nothing new in the process, and, secondly, that the whole thing is extremely theoretical and of a laboratory nature. My intention in the present article is to dispel these fancies and to draw attention to some facts which require the serious consideration of British papermakers, especially at the present time, when we are faced with competition in our industry such as we have never before experienced. For the benefit of those readers who may not have read articles already published on the subject I may briefly state that the De Vains process is based on the Cross and Bevan chlorination method of isolating cellulose with which every papermill chemist is familiar. Several commercial attempts have been made during the past forty years to place some modification of this process on a commercial footing, but none of these has met with the commercial success of the De Vains process, says the *World's Paper Trade Review*, of London.

In the ordinary methods of pulp manufacture the cellulose is isolated from the raw material in two stages, viz., digestion and bleaching. In the De Vains process there are three stages: (1) Digestion with weak alkali, (2) chlorination followed by alkaline treatment, and (3) bleaching. The only chemical used is common salt, which is passed in solution to a series of electrolytic cells which transform the salt into caustic soda solution and chlorine gas. The former is used for digestion and subsequent treatment of the pulp after chlorination. The chlorine is dissolved in water for chlorination, and in milk of lime to produce calcium hypochlorite for bleaching. The electrolytic cell used is designed by M. De Vains and has a very high efficiency, which I have personally checked for current consumption. The most important part of the process covered by De Vains patents lies in the plant used for chlorination, whereby this process is under perfect control without waste of gas and unpleasant consequences which have followed other attempts to control this reaction. The advantages of the process apart from any consideration in economy of power and steam consumption are as follows:—



STRAW PULP MILL, BUSSI, ITALY

1.—Universal application to the isolation of pure cellulose from any fibrous raw material.

2.—The production of cellulose suitable for the artificial silk and other cellulose industries without further treatment.

3.—The production of snow-white pulp from such fibers as esparto grass, jute, hemp, flax, straw, etc., which by ordinary practice yield impure celluloses of a color ranging from a creamy white in esparto to a brown in flax straw.

4.—The production of a bleached straw pulp which is not "greasy," and which may be run on the papermaking machine without any special precautions, to make a pure straw printing.

5.—The expensive recovery process in the case of esparto and straw is dispensed with, as the final product of the process, after the soda and chlorine have done their work, is a dirty solution of salt water, very dilute.

6.—Carriage on bleaching powder, loss of chlorine in storing and lixiviating this commodity and all the difficult labor in handling it are dispensed with completely.

7.—The process being continuous, plant of large capacity may be handled with the maximum of mechanical conveyance and minimum labor.

History of the Process

M. De Vains is a French chemical engineer who has spent the best part of his life experimenting with paper processes. Before the war he was convinced that the chlorination process could be made a commercial success. He put all the money he possessed into carrying out the experiments on which his patents are based, so that the experiments might be done on a practical scale. The next step was to get some papermaker to take the matter up. But papermakers are conservative where a new process is concerned, and the war years caused some delay.

Great credit, therefore, accrues to M. Biclet, a director of the Papeteries Berges, who, after careful consideration, decided to put the De Vains process to a practical test at their Lancey Mills, near Grenoble. These mills are very extensive, producing about 150 tons of paper and boards a day. They prepare their own sulphite and mechanical pulps, while other materials used include rags, straw and esparto grass. The De Vains plant was installed at these mills under the personal supervision of the inventor and with the capable assistance of the mill manager, M. Manificat, who is an enthusiastic type of papermaker; practical difficulties were studied and gradually overcome. This plant has now been running on straw and esparto during the past two years to the entire satisfaction of everyone concerned.

BLEACHING POTCHERS, BUSSI MILL, ITALY

Once the practical success of the process was established French papermaking interests was aroused, as is evidenced by the critical articles that appeared from time to time in the French trade press. Only after the adoption of the process in Belgium (Godin), in Italy (Bussi) and in Spain (Benalua) were French papermakers convinced that there was something in the process. Financial assistance was soon forthcoming for the exploitation of the process in three directions: First, for French pulp factories; second, for French paper mills; and, lastly, for places abroad. Pulp mills for the production of esparto and straw pulp at Venette, near Paris, and St. Rivalain, in Brittany, are in process of erection, while plans have been projected for others and the necessary capital raised. Another pulp mill is being erected at Lille to make linen pulp from flax waste.

BENALUA ESPARTO PULP MILL, SPAIN

The paper mill at Aussedat was one of the first French mills to adopt the process, and others are anxious to follow. Abroad, a mill has been erected in Java, and is now working on local raw material, viz., rice straw. A large straw pulp mill is projected for Canada. In the near future, and certainly before the end of 1924, the total daily production of cellulose in various mills will be between 150-200 tons of bleached pulp.

The Future of the Process

The development of the De Vains process is being watched with intense interest, not only by French papermakers, but also in Germany and on the Continent generally. Much of the woodpulp imported into France is of the highest bleached quality. Hitherto, attempts to make esparto paper in France have been regarded by British papermakers with amused disdain. Times are changing. The French papermaker wants to make his own pulp, and he has determined to make his own esparto papers. From what I have seen I am quite sure he will eventually succeed. The De Vains process has given him a pulp which has two advantages over esparto and straw pulps as prepared by the British soda-process, viz., a brightness of color and purity unattainable by the latter (with equal yield), and a freedom from greasiness and softness that makes the pulp almost as easy to handle on the machine as woodpulp. France has been and still is one of our best customers for fine esparto papers, but I am afraid that in the future we will lose this trade. It may take longer than I reckon, but it is coming. Certainly at the moment we cannot hope to regain any trade already lost in that direction, and we would do well to consider extension of our Colonial export trade for esparto papers.

BATTERY OF ELECTROLYTIC CELLS, BENALUA MILL, SPAIN

PRESS PLATE, BENALUA MILL, SPAIN

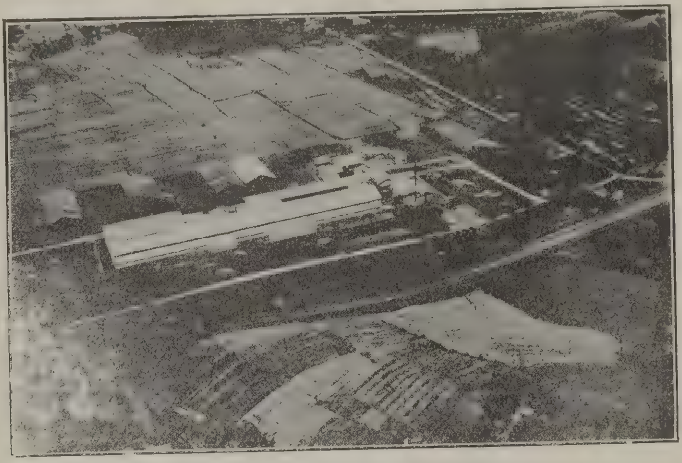
Following on two visits to France for the express purpose of studying the De Vains process, I have been frequently asked to give my opinions on French papermakin generally, and on the De Vains process in particular. Wit regard to French papermaking, I have been strongly impressed by the fact that the French papermaker realize that he has been playing second fiddle too long in this industry, and that he is determined to make good in th future. Great interest is being taken in technical education, and economy in the use of power and production of raw materials are being closely studied.

With reference to the De Vains process, I am quite satisfied that the practical solution of the difficulties arising from the chlorination process by M. De Vains and his staff mark a distinct advance in the practical technique of pulp manufacture, the most important advance in my opinion since the invention of the sulphite process.

I foresee possible developments, principally in two directions. First, in the production of pure cellulose from waste fibrous materials, such as flax, jute and manila that are at present being used for the manufacture of brown paper and which materials do not lend themselves to the production of pure bleached pulps by other existing processes without great loss of yield and deterioration of the fiber. In the second place, the process is peculiarly suited for the working up of the waste straw from crop plants in regions where fuel is scarce and waterpower available. Such circumstances also apply to the tapping of the inexhaustible growth of vegetable matter in tropical regions, and is the first practical proposition for tackling this long-discussed problem, so long as waterpower is available. The only other materials required, salt and limestone, may be obtained almost anywhere.

STRAINERS AND BLEACHING POTCHERS
BENALUA MILL, SPAIN

With regard to the application of the De Vains process to straw and esparto in this country, I am not satisfied that, with cheap fuel and rigid economy in every direction applied to British practice, the latter could not hold its own for cost of production against the De Vains process. I do know, however, that there are esparto mills in this country whose present costs of production are greater than those of the De Vains process. The De Vains process has a marked advantage in the production of purer pulp with such a look-through that once a customer had received a supply of such paper he would, as we all know from experience, keep that as a standard and demand it. There is no doubt that the chief hope of the fine paper trade in this country at the present time is in increased and cheaper production, larger plant, less labor and faster machines; and also in the expansion of export trade where we must give the finest papers at the keenest prices. It would be a hopeless proposition to consider the scrapping of expensive recovery plant, etc., without a very considerable advantage in exchange, but, in the erection of new mills or new plant, very careful consideration should be given to the possibilities of new processes. The De Vains process certainly yields the finest esparto and straw cellulose the writer has ever seen, and, what is more important is that the physical condition of the stock is such that, with normal treatment, it may be run with less trouble and at higher speeds than is the case with such pulps as the British papermaker knows them.



RICE STRAW PAPER MILL, PADALARANG, JAVA

It may appear to the reader that I am a trifle enthusiastic in my opinions of the De Vains process. I write thus purposely to draw your attention to what is undoubtedly an important invention in the history of pulp manufacture and worthy of your serious interest. Its practical development in France has been rapid, but slow in comparison to what such a process might become in the hands of our fine papermakers.

Receivers Named for American Woodpulp Corporation

Following the filing of a petition in bankruptcy by three small creditors, Judge Winslow appointed David Steinhardt and Byrne Budd receivers for the American Woodpulp Corporation, importers of wood pulp of 347 Madison avenue, New York, on January 16. This action, which was taken with the consent of the company, was occasioned by the company's financial embarrassment resulting from the suspension of the Durham Paper and Pulp Company. A statement issued by the American Woodpulp Corporation said that that company had, at the instance of the Durham Paper and Pulp Company, engaged in the Spring of 1923 in transactions for the purchase and sale of wood pulp in conjunction with the Durham company under arrangements whereby the Durham company, then considered a very substantial concern, assumed substantially all the risk and the American Woodpulp Corporation stood to make a fair profit by way of commissions.

The statement went on to say that the American Woodpulp Corporation had made advances to the Durham company on consigned goods in the form of trade acceptances to a large amount which were discounted by the Durham company with banks. Unforeseen financial difficulties which came upon the Durham Paper and Pulp Company in a falling pulp market prevented the expected realization on the goods and caused the Durham company to suspend payments, leaving the American Woodpulp Corporation holding a considerable amount of trade acceptances of the Durham company discounted at banks and upon which it was liable as endorser in addition to the acceptances which it had given to the Durham company.

As a result of the failure of the Durham company, coming on top of a poor business season in the summer of 1923, the American Woodpulp Corporation found it impossible to meet its obligations as they matured. The appointment of receivers was consented to for the purpose of avoiding suits and attachments or preferences, and of conserving the property for the benefit of all creditors.

Recent New Dyestuffs for Paper Tinting

Some Valuable Notes on Dyestuffs in Paper Tinting That Will Interest Every Papermaker

> **What do you think of it?**
>
> **Here is an article by an authority on dyestuffs for paper who will not permit the use of his name owing to his firm connection.**
>
> **Perhaps this fact is a good thing as it permits him to speak right out in the open frankly and plainly. What is said here will interest everyone in the trade, even though he is not the man who is in charge of the tinting or coloring of the paper.**
>
> **Read this article and then tell us what you think of it. You need not agree with all it says.**

THE list of desirable new dyestuffs for use in paper tinting is very small. The list of alleged useful and new dyestuffs would be quite large, even if the meaning of the word tinting was confined to tinting to White. A list of alleged useful and new dyestuffs, tinting to all light shades, would fill several pages of meaningless words, as any coloring matter will produce a tint, but the usefulness of the tint would be in question. The new fast colors coming into use, will not end the usefulness of any of the old line colors, they are simply valuable additions, but must be used in the right place, where they will produce improved results.

Ultramarine Blue DT is a wonder product, the most brilliant blue coloring matter known, fast to alkali, sunlight and alum, removing the last objection to the older brands of Ultramarine Blue, that of being decomposed, or destroyed in the stuff chest over Sunday, due to contact with the weakly acid alum for 24 hours.

Phospho-Tungstic and Phospho-Molybdic Acids have been found to combine with suitable anilines and increasing their fastness to light, 3 to 400%, but such combinations can only be produced in reduced strengths. However, the blues are very desirable products for tinting to white and as the most important are on the red shade blue, they can be combined with ultramarine blue, which increases the fastness of the blend. They are on the market under various trade names, their merit depending entirely on the care used in their manufacture. Dependable products are supplied by reliable and well known manufacturers of colors for the paper trade. All colors, or shades are possible, but are not yet being produced, as their field of usefulness is in doubt.

To explain the usefulness of the new colors, it is necessary to refer to the old line for specific purposes, for comparison, and should probably be done under another heading, but as their purpose is tinting to White, almost entirely, we will explain how the various white papers have been and are tinted and it can then readily be seen how the new colors fit in and their value calculated for use in various mills.

During the war, Paris Black, a cleaned lamp black, was used by News Print mills in Canada, at least in several of them, to neutralize the natural yellow shade of the ground wood, and it gave the sheet a fairly good white appearance.

Here in the States, improved results were obtained by the use of Liquid Mauve, made from accumulated Fuchsine residue, and Hematine Crystals, a highly oxidized solid extract of Logwood, in granular form. Each shade of course with a small quantity of Sol. American Blue, the production of which was started on a large scale. The same colors were also necessary to makers of magazine, book, bond, blotting, etc., but sparingly and were quickly dropped by the fine paper makers, when the first small lots of anilines were manufactured.

For News Print, Basic Blue, a blend of Methylene Blue and Methyl, is now the most satisfactory coloring for tinting to White, producing the brightest White shades possible. Fastness to light is not a requirement, as the wood itself quickly changes shade on exposure and any fastness to light feature of the coloring matter, Basic Blue, would be lost, so it can be readily seen, the new colors for tinting will have no useful application in the news print mills.

Bag and wrapping paper mills, users of Sulphite and Sulphate pulps, also use Basic Blue for tinting to White. Not much of a White can be made of Sulphate, or Kraft pulp, but never the less, a small quantity of Blue is added in an effort to brighten the sheet. Fastness to light is not a feature of White bag or wrapping paper and would be impossible, as the unbleached stock becomes yellow and brown on exposure to light and would overcome the fastness to light of a very small quantity of coloring matter.

Bleached Soda pulp also contains a little natural coloring, that readily turns a little yellow on exposure to light, and very fast White shades cannot be expected of paper containing Bl. Soda pulp. The most suitable tinting colors being Acid Aniline Blue, shaded with Fast Acid Violets, or Fast Acid Scarlets. Acid Blue B, Fast Acid Violet B and Fast Acid Carminette are ideal tinting colors for White papers, containing Bl. Soda Pulp, as a fastness to light feature of a dyestuff would again be lost.

Bleached Sulphite stock also changes a little on exposure, but not to the extent noticed in Bl. Soda Pulp, but enough to be troublesome and if an all Bleached Sulphite sheet is made, Acid Blue B, or R and Fast Acid Violet B or Fast Acid Carminette, are no doubt the most suitable tinting colors, but as Bl. Cotton Rag is added, the mixed stock becomes less sensitive to light, according to the percentage of Bl. Cotton Rag added. Now White shades can be produced, very fast to light, requiring the use of the brilliant Ultra-marine Blue DT, shading with the next in fastness, a Phospho-Tungstic, or a Phospho-Molybdic product. To make the matter clear to our readers, permission was asked and granted by The Heller & Merz Co., to specify Helmerco Blue 4/R Conc. as representative of the Phospho-Tungstic-Molybdic group. Bleached Cotton Rag stock changes very slightly, even often prolonged exposure to sunlight and when tinted to a White shade with Ultramarine Blue DT and Helmerco Blue 4/R Conc., the most permanent possible result is obtained. Clay, for White Coated papers, should be carefully selected, rejecting those that have already been tinted White, unless they remain practically unchanged on exposure to sunlight, as much of the handsome White Clay offered, has been tinted to a White with a fugitive aniline color.

Natural Clay should be used and tinted with any of the well known brands of Ultramarine Blue.

Drastic Report by Foresters

A special committee of the Quebec provincial foresters on the problems of fire prevention, regulation of operations of loggers and permanent forest preserves has reported, making drastic recommendations, such as holding down of the cut to the annual growth and prevention of fires to conserve reproduction. An inventory of resources, to be followed by a license system for the cutting of all land is proposed, in addition to the establishment of experimen stations. Pointing out that 60 percent of the forests in the Lake St. John and North Shore districts have been destroyed by fire in the last 40 years, a non-political fire fighting force is proposed, to be maintained at a cost of $750,000 a year.

At a conference of Ontario foresters the high cost of aeroplanes fo fire spotting was discussed, although the value of the service wa not questioned. A fire fighting air force under provincial control was the prevention method most favored.

Action of Rosin and Alum in Sizing Paper

Scientific Speculations Concerning the True Sizing Factor in the Rosin Size—Aluminum Process

By DR. CARL G. SCHWALBE

EVER since rosin was first used as a paper size, the question which has apparently remained unanswered in terms acceptable to all, is whether aluminum resinate or free rosin was the active agent in sizing the paper. The originator and champion of the free rosin theory, Dr. Wurster, was confronted with the fact that satisfactory rosin sizing could not be obtained with rosin size precipitated by sulphuric acid, but only with rosin size which was precipitated with alum, or aluminum sulphate. No permanent sizing effect could be obtained without the use of this aluminum salt. Hence this investigator explained the mechanism of the sizing process as being one of flocculation of the particles of rosin which are thrown down in the free condition on the fibers of the pulp and which are primarily responsible for the sizing quality of the paper. In other words the size of the particles of rosin are the determinant factor in the degree of sizing that is produced in the paper fibers.

Aluminum Hydroxide Necessary in Rosin Sizing

The author published a critical consideration of rosin sizing speculations in the year 1912, in which he came to the conclusion that the essential factor in rosin sizing was the formation of aluminum hydroxide, which coats the small particles of rosin with a protective envelope. In this communication he said, "As, nevertheless, practically the whole of the alumina from the aluminum sulphate used in the sizing process is precipitated on the paper fibers, the sizing agent in the paper must be considered to be the mixture of aluminum hydroxide and free rosin."

The assumption that the presence of aluminum hydroxide is essential in the attainment of sizing quality in the paper is fraught with many advantages in clearing up the speculative aspect of the rosin sizing process. This is particularly so when consideration is taken of the fact that rosin and resins in general are so easily oxidized to give products which do not possess sizing properties. The function of aluminum hydroxide seems to be to protect the finely divided rosin particles from being oxidized in this manner. The aluminum hydroxide covers the individual rosin particles with a coating of glutinous material; it shuts them off from contact with the air and at the same time it fills the interstices between the separate particles, very much in the manner that the grains of sand are held together in a sandstone by means of the calcareous binder. Furthermore the coating of aluminum hydroxide prevents the flowing together of the particles of rosin when the paper is being dried on the drying cylinders of the papermaking machine.

The objection that aluminum hydroxide must be dissolved by the acid inks that are used in printing and in writing on rosin sized papers is not tenable, for during the drying process certain forms of the hydroxide are produced which cannot be dissolved even in rather strong acids. Furthermore this view of rosin sizing stands in a very good relation to the results that are obtained when paper is sized with rosin size precipitated by means of sulphuric acid. The sizing quality of such paper undergoes diminution as the paper gets older, for the simple reason that the particles of rosin are not covered with a protective film of aluminum hydroxide. This means that the rosin is easily oxidized with the formation of brittle, no longer crystalline but amorphous, particles. Fine fissures form in the coating of size through which water penetrates into the fiber of the paper. The fact that the addition of gelatin and starch pastes to the rosin size gives a mixture which enhances the sizing quality of the paper only strengthens this assumption, for they also protect the particles of rosin against the oxidizing action of the atmosphere.

Rosin sizing is one of the most important operations in the manufacture of paper. While the practice of rosin sizing has been worked out rather closely along certain lines, the theoretical consideration of the process is still in the state of discussion. There is no positive agreement yet as to what exactly happens when a paper is sized with rosin. There is still no universally accepted theory of rosin sizing. While it may not be apparent to many paper men that it makes any difference to them whether or not the correct explanation of the chemistry of rosin sizing is ever ascertained, nevertheless it must always be remembered that the best piece of practical knowledge is a well formulated theory. If it is known exactly what takes place in a process, it is comparatively easy to regulate the conditions so that the best results are obtained with the least expenditure of time and money. It is almost impossible to get satisfactory results from a process the operation of which is not understood. Hence the accompanying article by Dr. Schwalbe, translated from Papierfabrikant, is of considerable interest, even though it deals with the theoretical aspect of rosin sizing.

Wurster himself showed that rosin powder, when it is subjected to the action of acids and bleaching agents, by the drying out of the acid, such as sulphuric acid, nitric acid, hydrochloric acid, oxalic acid, or the bleaching agent (sodium hypochlorite) on the size, renders it pervious to water.

The author goes on to say that he did not submit his speculations to any experimental substantiation as time was lacking. He reviews some of the work of other investigators but concludes that but scant attention has been given his views by other workers in this field. However, only recently he had the opportunity of attempting to prove his ideas by setting one of his students to work on the problem. A number of conclusive experiments were carried out.

The Aluminum Hydroxide Coating Affords Protection Against Light

If the particles of rosin are actually covered with a skin of aluminum hydroxide in the colloidal state, this coating will protect them against the action of air and light. It is known that air and light, particularly light, has an apparent physical action on the rosin. Ordinary or normal rosin is amorphous and shows a conchoidal fracture when broken, while rosin which has been exposed to the action of light has a crystalline structure. While the normal rosin is almost completely soluble in petroleum ether, the rosin which has been subjected to light is only slightly soluble in this solvent. The solubility of the rosin decreases as its exposure to light is prolonged and also as the intensity of the light to which it is subjected is increased. The determination of the solubility conditions affords a means of proving whether or not the rosin particles have actually been covered with the protective coating of aluminum hydroxide.

If the particles of rosin lie between the fibers of the paper without any covering of aluminum hydroxide, then they will be strongly affected by the light and hence their solubility in petroleum ether must greatly reduced. On the other hand if they are actually provided with such a protective coating, then they must resist the influence of light much more effectively. It is a comparatively easy matter to prepare a paper sample in which the rosin particles are directly exposed to the action of light by merely sizing the paper with rosin size precipitated by sulphuric acid. In this condition the paper contains only free rosin.

This method of sizing paper has been investigated as it afforded a much cheaper method of sizing the paper than by the use of aluminum sulphate as the precipitating agent. While the paper may first possess high sizing quality when it is made in this manner, it soon loses this after being stored for some time or on exposure to light. Samples of paper which are sized by both methods and subjected to the same exposure to light will therefore show different degrees of sizing quality at the completion of the experiment. Then when the papers are extracted with ether, it should be expected that the rosin in the paper sized with aluminum sulphate will be entirely soluble in petroleum ether while that in the other paper will not be completely soluble.

Practical Tests Made

Tests were accordingly made to determine the correctness of these assumptions. Two samples of pulp, each weighing 100 grams, were mixed with five liters of water and were beaten in an experimental beater until the pulp showed a degree of beating equivalent to 40 on the Schopper-Riegler scale.

Three grams of rosin were saponified with 0.386 Gm. of caustic soda; the mixture was stirred into 120 Cc. of water and a solution of 0.2 Gm. of oxalic acid in 800 Cc. was added to this suspension. This rosin size was then added to the pulp in the beater. In the first test the rosin was precipitated with a solution of 3 Gm. of aluminum sulphate in 1 liter of water. In the second test an equivalent quantity of sulphuric acid in a 0.25 per cent concentration was added as the precipitating agent. A number of paper sheets, in as uniform a condition as possible, were made from these two samples of pulp. The sheets were made on a hand mould and were carefully dried under tension at a temperature of 80° C. The dried paper samples were then subjected to the action of sunlight for a period of five days.

Then approximately 30 Gm. of the paper was extracted with ether. The ether was distilled off and the residue taken up in petroleum ether and filtered. The undissolved mass was carefully washed with petroleum ether and then dried and finally weighed.

Results

The paper that had been sized with aluminum sulphate showed a content of only 0.005 Gm. of substances insoluble in petroleum ether. On the other hand the paper that had been sized with the aid of sulphuric acid as the precipitating agent showed a content of 0.043 Gm. of insoluble material.

It follows from the foregoing that the presence of aluminum hydroxide mina has actually a protective action on the particles of rosin size in preventing them from being adversely affected by light. Hence the fact that paper sized with rosin which has been precipitated by sulphuric acid loses its sizing quality may be explained by the absence of aluminum hydroxide to protect the particle of free rosin against the action of light.

It is possible to take an additional step and come to another conclusion. When paper is sized with rosin size and aluminum sulphate a reduction in the sizing quality of the paper can take place if the rosin particles are not completely surrounded with a coating of aluminum hydroxide, and so are not protected against the influence of light and air. There are to be sure numberless variations in carrying out the sizing process. Furthermore there are quite a number of factors, which affect the precipitation of the rosin size by means of sulphate of alumina, so that it is very possible that the protection afforded the particles of precipitated rosin size by the coating of aluminum hydroxide is not sufficient, with the result that the sizing quality of the paper is liable to rapid deterioration.

The Coating of Aluminum Hydroxide

It is possible to consider that the complete encompassing of the particles of rosin with a coating of colloidal aluminum is accomplished only with the greatest difficulty, as the particles of rosin, which adhere to the cellulose fibers, possess a protective action only on one surface, the one exposed to light and air. It is necessary, however, to realize that the cellulose fibers are able to adsorb only a very small proportion of sodium resinate or the emulsion of free rosin in a solution of caustic soda, so that the coating with the protective aluminum hydroxide, according to the same reason, must make place in the aqueous liquid between the fibers. It is then that for the first time that the particles of rosin which have become coated with the protective aluminum hydroxide are adsorbed by the cellulose fibers.

Importance of Correctness of This Assumption

If this hypothesis is correct, then it would be advantageous under certain conditions to carry out the coating of the particles of rosin with aluminum hydroxide in absence of the pulp and then to add the so-called "prepared" particles of rosin to the pulp in the beater. From a practical standpoint the carrying out of the separate precipitation can scarcely be permissible in the beater, because the great dilution of the solutions that must be used in the precipitating process requires quantities of liquid which have a too strong diluting effect on the stock in the same. It is only after the stock has been allowed to flow out of the beaters into the agitating tanks that the possibility is presented of adding very dilute emulsions of prepared rosin to the fibers. Experiments to explain the mechanism of the sizing process should be carried out along these lines.

EMPSALL RECEIVES FINE PROMOTION

Is Elevated From Treasurer to Vice President—Carl B. Martin Is New Secretary

ELEVATION of Frank A. Empsall, formerly treasurer of the St. Regis Paper Company, to a vice-presidency, and the election of Carl B. Martin, secretary to fill the treasureship were the two principal changes made at the annual meeting of the St. Regis Paper Company held recently. The vice presidents of the company now number five, and are, besides Mr. Empsall, Alvah Miller, David M. Anderson, John J. Warren and R. B. Maltby.

Floyd L. Carlisle of New York City was again elected president of the St. Regis, and the old directors were all retained, as follows: D. M. Anderson, Jonathan Bulkley, C. C. Burns, F. L. Carlisle, W. K. Dick, F. A. Empsall, J. J. Warren, Alvah Miller, J. A. Mollenhauer, H. E. Machold, R. B. Maltby, J. N. Carlisle and D. G. Middleton.

Corwin T. Jewell, assistant general manager, was made asisstant treasurer of the St. Regis, and R. J. Parham of the New York office was again elected assistant secretary. Celestin C. Burns was continued as general manager.

Immediately after the St. Regis meeting the Hanna Paper Corporation held its annual meeting and retained its old slate of officers and directors. F. L. Carlisle is also president of this corporation; the vice presidents are R. B. Maltby, D. M. Anderson and H. E. Machold; Mr. Maltby is secretary and treasurer, and Carl B. Martin is assistant secretary and treasurer. The Hanna directors are the same as the St. Regis's, with the exception of M. A. Hanna III.

Du Pont to Make New Dyestuff

The production of a new dyestuff known as Lithosol Scarlet 3B is announced by E. I. du Pont de Nemours & Company. It is stated to be especially adapted for use in lakes for printing and lithographic inks. The lakes can be used for obtaining pink tints which are quite fast to light in lithographic inks and paint.

It is soluble in water and is used only in the form of its barium lake, which is bluish red in shade. This lake is remarkable for its good covering power and extreme fastness to light. On exposure it turns somewhat bluer but does not fade. In fastness it approaches nearer to Madder Lake than any other lakes of its approximate color. It does not bleed in oil or in cold water and is unchanged at 175 degrees Fahrenheit.

IROQUOIS COMPANY TAKES NEURA COMPANY

Seizes Manufacturing Plant at Hadley on Breach of Contract Charge

THE Iroquois Pulp and Paper Company, of Thomson, N. Y., has seized the paper manufacturing plant at Hadley, formerly known as the Neura Paper Company. The Iroquois company claims the recent owner, the Durham Paper Company, has breached a contract entered into by the two concerns.

Sheridan P. Wait, of Saratoga Springs, as attorney for the Iroquois Paper Company, and B. W. Wilson, deputy sheriff, have taken possesion of the paper mill.

It is stated that the Adirondack Trust Company, as trustee, sold the property to the Durham Paper Company, subject to contract. The contract itself was subsequently sold by the Adirondack Trust Company as trustee for the Neura Paper Company to the Iroquois Paper Company.

The mill has been closed temporarily. It is expected that the matter will be taken to supreme court.

* * *

Pulpwood Stocks Are Low

Stocks are relatively low in most of the regions reporting in the December pulpwood report issued by the Woodlands Section of the American Paper and Pulp Association. The 1924 contract prices are generally higher than those of 1923.

New England and the Lake States show some increase in the ratio of contracts to annual consumption for December as against September 1923 and 1922.

With 92 companies reporting the annual consumption of the country was 3,388,860 cords, with stocks on hand of 2,101,766 cords and 1924 contracts of 1,950,757 cords.

New England prices for December were: rough, $13.75; peeled, $16.96; rossed, $23.00. This is a slight decrease from March and September reports and approximately the same as in December, 1921. In New York the prices were for December, rough, $15.25; peeled, $19.33; rossed, $24.52. Lake rough was $15.96.

Bullock Is Made a Major

Warren B. Bullock, Director of the Information Service of the American Paper and Pulp Association has been promoted to Major in the Quartermaster Officers Reserve Corps of the Army, and has been made a member of the advisory board of the New York Quartermaster Officers Conference, which is popularly known as the New York Winter Plattsburg. Having been senior instructor of the Motor Transport School of the Army during the war, Major Bullock has been assigned to duty with the National Motor Transport Service, commanding the sub-center at Poughkeepsie, in case war or other national emergency might force the resort to highway transport for the feeding of New York City. He would in such an emergency be responsible for motor operation on the highways between Albany and the New York City line.

Keller Opens Office in Sweden

The E. J. Keller Company, among the livest dealers in papermakers' supplies, chemical and mechanical pulps, etc., announce in this issue of PAPER that it will open an office in Sweden. This office will be located a Malmtorsgatan 3, Stockholm, and will be managed by C. R. Saabye Christiansen, who has been connected with the woodpulp trade for many years and is well known in al parts where Scandinavian woodpulp is sold

The opening of the new office was necessitated by the steadily and consistently growing business of the company.

The Well Water System in the Mill

An Informative Dissertation on How a Well Water System Works Out in Practice in the Paper Mill

By T. H. HAMMOND
President, Hammond Bag and Paper Co.

THE new plant of the Hammond Bag and Paper Co., Wellsburg, West Virginia, which was completed October 1, 1923, is one of the most completely equipped and modern paper mills in the country. In the construction and design of the plant particular attention was given to the efficiency of production; labor saving devices, conveyors, electric drives and all facilities necessary to expedite the manufacture of paper and paper bags for flour, cement and cereal products were installed.

In the development stage of this plant the most difficult problem which we had to solve was our water supply. Five hundred gallons of water per minute were needed to supply our demands; it was essential that this water be pure, colorless, free from acid and constant temperature if possible. The Ohio River water was easily accessible, but the filtration and purifying processes which would have been necessary, the warm temperature of the river water in the summer time, the discoloring effect and high acidity prompted us to make other investigations. We realized that if an adequate supply of well water were obtainable it would be very desirable as the temperature is practically constant and the color and acid are entirely eliminated. Not knowing the geological formation underlying our property we did not care to take a chance on drilling wells and then perhaps not procuring the water or did we want to pay a well driller so much per foot to experiment. We wanted the well water but wished to be relieved of the responsibility.

The Layne Ohio Co., an associate company of the Layne and Bowler Co., Memphis, Tennessee, had installed well water systems for other paper companies in the Ohio valley and in hopes they could assist us in this problem we arranged an interview with one of their engineers. After a thorough investigation and study of the strata underlying our property the Layne and Bowler Co., agreed to install a complete well water system and guarantee a production of 500 gallons per minute. They assumed complete responsibility—if upon test the well and vertical pump failed to produce this amount we would be under no expense or obligation to them.

T. H. HAMMOND

An Engineering Feat

The construction of our well which is known as the gravel well type was most interesting from an engineering standpoint. A temporary wooden derrick was built over the well site and then with the various drilling tools a 30 inch hole was drilled through the top soil and to the bottom of the water bearing formation. The hole was lined with a steel casing from the surface to the sand formation. A 24 inch casing and shutter screen were set concentric to the larger casing; the smaller casing extended from the ground level to the sand stratum while the shutter screen extended from the lower end of this casing to the bottom of the well. Between the two casings was an intervening annular pace into which was fed a predetermined size of gravel. The gravel was carefully selected so that the voids or openings were smaller than the sand grains. The openings in the shutter screen were of a size that restrained the gravel but allowed the water to enter freely.

Separates Water From Sand

By this method the gravel not only served to separate the water from the sand with minimum resistance, but formed a very large separation area. It is evident that the water will flow more readily through a large area than a small one and require less external pressure. This is the reason that in our gravel wall well the draw-down was only four feet while in a six or eight inch well it would be thirty or forty

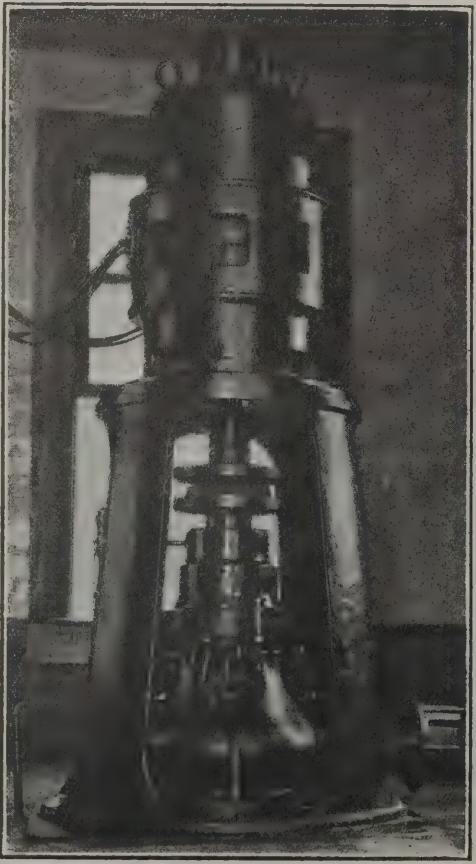
Plant of the Hammond Bag and Paper Company Nestled in the Hills of West Virginia feet to give the same capacity. When the pump is not operating the water stands at the highest point in the well; this is called the "static level." When the pump is operating the water lowers to the "pumping level." The difference between the two levels is the draw-down. As the power required to pump the water is proportional to the level of the water in the well, it is apparent that the less the draw-down the more efficient and economical is the pumping unit.

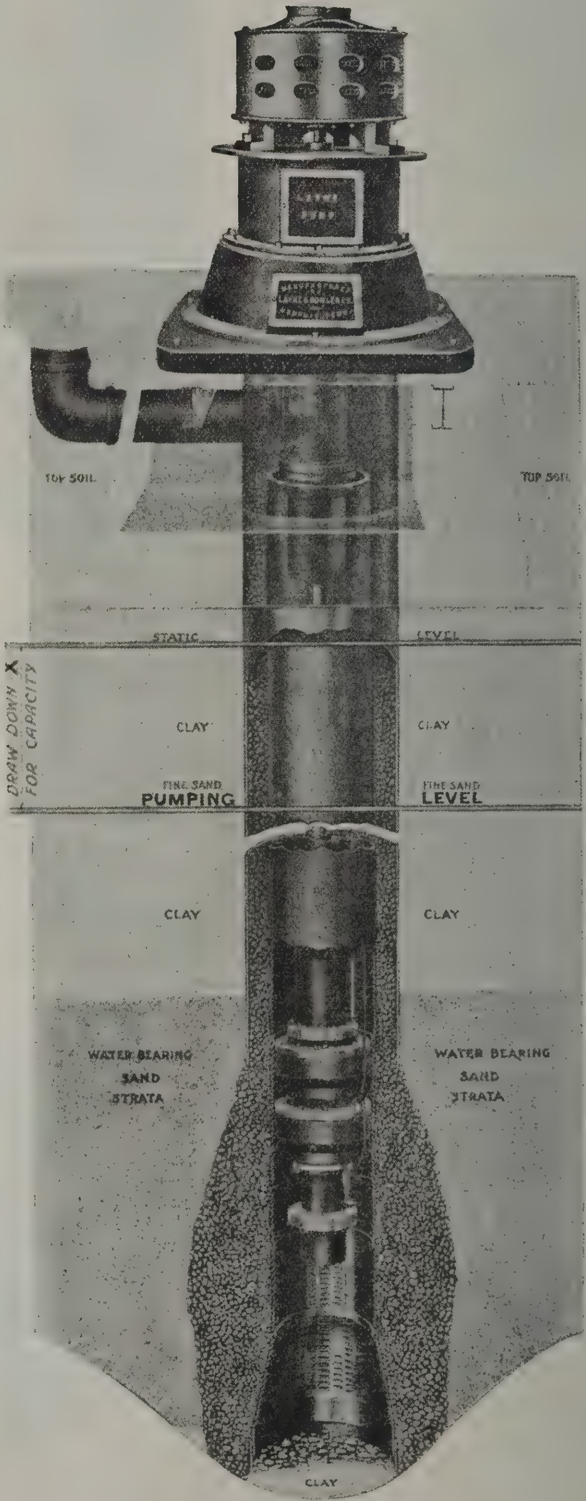
After the casings and screen were in place a temporary pump was set in the well and the sand and water drawn in through the large shutter screen openings with a high velocity. Tons of gravel fed in from the surface gradually replaced the sand and after several hours of pumping the gravel entirely surrounded the shutter screen. When the well had been pumped free of sand and would take no more gravel the well was tested for capacity. It was found that this well which was guaranteed to produce 500 gallons per minute, was good for 2000 gallons per minute. On official test 850 gallons p minute flowed over the weir while t water level in the well receded onl four feet.

How It Was Built

The permanent pump was set on concrete foundation at the surfac 25 horse power vertical motor and th thrust bearing of the pump were su ported by the pump head. The di charge column bolted to the base pla extended 60 feet below; the pum bowls which housed the impellers we

TYPES of pumps used, with larger photograph showing a cross section, with the various elevations marked off. The compact, powerful pump emanating strength and capability is shown in the smaller picture.





securely fastened to the lower end of the discharge column; the vertical shaft to which were keyed the impellers revolved in an enclosed oil tubing and connected to the motor shaft through a flexible coupling. The impellers revolving at a high speed forced the water upward through the discharge column and into the mill mains at a pressure of 40 lbs. In one operation the water is pumped from the wells and into the mains.

The pump consumes approximately 21 horse power or 15.5 Kilowatts when pumping 850 gallons per minute. In one hour at that rate 15.5 Kilowatt hours are used to pump 51,000 gallons or .3 KWH per 1000 gallons. Electric power cost 1½ per KWH, which means a pumping cost of less than ½c per 1000 gallons. The cost of pumping is very economical compared with other methods and the quality of the water is far superior to the river water. The pump requires very little attention, and is practically noiseless in operation.

On page 11 can be seen the new mill and the Pennsylvania Railroad siding; page 12 the Layne vertical pump and on page 13 the capacity test of the well.

Our well water system is a decided asset to the mill as a plentiful supply of clean, cold well water is available twenty-four hours a day.

Water or No Pay

What would it mean to your plant to have a plentiful supply of pure well water—pumped from scientifically constructed Layne Gravel Wall Wells by the Layne Vertical turbine pumps into surface reservoirs, elevated tanks, or directly into the mains.

So efficient is this method of procuring a water supply that hundreds of industrial plants are saving thousands of dollars a year by adopting the Layne System.

NEW DEVELOPMENTS IN PAPERMAKING

The Use of Glue in Coating Paper

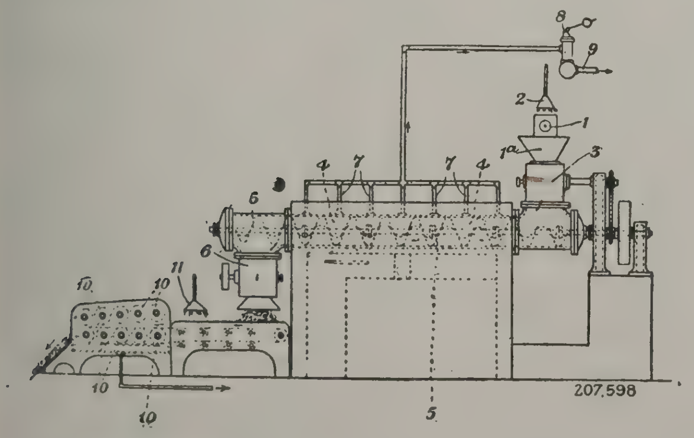
The Bureau of Standards is carrying out some experiments which deal with the use of glue in coating paper. Nine runs have been made on the experimental coating machine. In these investigations two makes of bone glue were used in eight of the runs and a French casein glue in one of the experiments. A good grade of English coating clay (Lee Moor) was used for all runs, and the results indicate the water resistance of the coated paper which was made with the glue samples in which the glue was treated with chorme alum, compared favorably with that of the paper in which casein preparations were used in coating the same. In this case no formaldehyde was employed in making the casein mixture. It is believed that the degree of waterproofing that was obtained in this manner would be sufficient for most of the papers that are used in halftone printing. Difficulties have been experienced in obtaining a uniform coating, because of the variation of the fluidity of the coating mixture and mechanical defects in the machine, so that additional work will be necessary before paper suitable for printing tests can be produced. For further details see Chemical and Metallurgical Engineering Oct. 22, 1923.

Paper from Peat

Freshly cut peat is disintegrated and then boiled with milk of lime and sodium sulphate, sodium sulphite or sodium carbonate, or other substances which yield these products by reaction. The cellulose material obtained in this manner is bleached and neutralized, and may then be used as a material for the production of paper. A superior product may be obtained by boiling with large quantities of milk of lime under increased pressure in an autoclave. In an example one hundred parts of the peat are treated with milk of lime containing ten parts of calcium hydroxide and five parts of sodium sulphate are then added, the mixture being heated by superheated steam. Bleaching is effected by chlorine, the lye is removed and the cellulose is washed with water and neutralized with ammonia washed and dried. For further details see British Patent No. 207,337.

Treating Cellulose Materials

Cellulose material, for example wood, peat or the like, is treated without pulping by spraying with a catalyst, such as a mineral acid and passing it through a tube containing a conveyor, during which it is subjected to steam pressure to hydrolyze the material and recover certain by-products. The residue is then pressed to remove saccharine liquor and then distilled by means of hot gas.



The material is supplied by a conveyor 1 to a hopper la, where it is treated with the acid from a sprayer 2. The material then passes through a gas-tight valve 3 to a hydrolyzer 4 containing a screw conveyor 5. The tube is heated externally, so that the steam generated passes through the material. The action of the catalyst and the steam liberates furfural, guaiasol, and methyl alcohol, which passes off with the steam through the pipe 7, the valve 8 and the pipe 9 to the recovery plant. The continual removal of the furfural and other anti-ferments facilitates the ultimate fermentation of the sachharine liquor for ethyl alcohol. The residue passes through a gas-tight valve 6 to a conveyor which is sprayed with a neutralizing agent by a device 11 and thence through a series of pressing rolls 10. The material is then conveyed to a distilling produced where it is distilled by contact with hot producer gas.

This process is patented in British Patent No. 207,598.

Waterproof Paper Board

Paper pulp is beaten with water at a temperature of approximately 45 degrees C, with the addition of a small quantity of lime, and when disintegration is employed, finely divided montan wax is shaken in and beaten continually until thorough mixing is obtained. Small quantities of aodium silicate and sodium resinate are added, and after mixing, sufficient alum to precipitate the lime and the montan wax. From the stock that is prepared in this manner a sheet is formed in the usual manner, the drying rolls being heated to a temperature sufficient to cause the montan wax to melt and permeate the whole mass of the paper. Perferably composite sheets are made by the use of a multi-cylinder machine, the additional layers being formed by any suitable fibrous stock. The finished sheet is preferably calendered. In place of montan wax other hard gums or bitumens may be used. The waterproofing effect of montan wax is so great that the sheets in the composite product can be made very thin. For further details see United State Patent No. 1,468,959.

Paper for Music Rolls

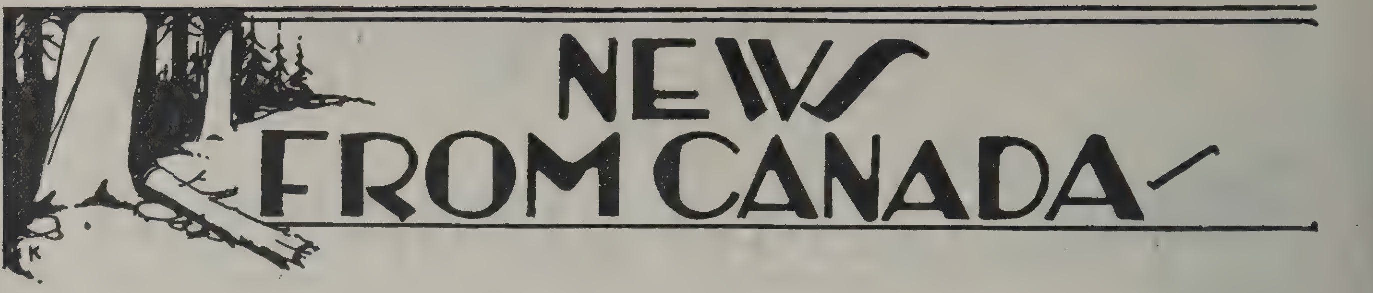
In the production of this kind of paper and other similar makes which are suitable for making the cards used in weaving machines and in sorting and classifying machines, the paper is preferably treated before perforation. This treatment consists in sizing the paper with an animal size, casein or albumen and squeezing it between pressure rolls, either during or after the sizing operation, and then hardening with alum, chrome salts, formalin, etc. After treatment the paper is rolled up wet and allowed to stand for twenty-four hours and is then dried on skeleton drums through which warm air is blown. The absorption of the size is improved and the duration of the sizing is reduced by the addition of latic acid or an alkali such as caustic soda to the sizing material.

By blowing cold air on to the paper before it is dried pores and hair cracks are avoided. After hardening the paper may be softened and rendered tough like leather by treatment with glycerine, soap, castor oil or the like. A coating of varnish applied after the treatment with glycerine prevents the glycerine from absorbing moisture and renders permanent the flexibility and tenacity of the material. For music rolls intended for tropical countries the paper may be finally treated with molten or emulsified wax.

Use of Malt Extract in Paper Industry

IN a paper read before the Montreal Section of the Societyof Chemica Industry at Guelph, November 30, 1923, A. Linton Davidson, spoke of the singular influence of malt diastase upon starch, which has pressed malt extract into service in the paper industry, where it has been used as a substitute for boiling with soda or milk of lime to remove starch and encrusting matter from rags and jute, because alkali residues, which occur chiefly in coated papers, destroy Prussian blue and react instantly with acid colors. How much more perfect is Nature's way of bringing about such changes than man's less refined procedure with strong soda or burning acid to produce the same result. Malt extract is also used in this industry as a dextrinizing agent for starch, which then serves to increase the strength and improve the finish of the paper into which it is introduced. As a result of the same dextrinizing quality, it sometimes enters into the composition of adhesive pastes.

Turn to the Clearing House and Read Every Line—It Will Pay You



NEW ADDITION TO THE PLATTSBURGH CO.

Capacity of Plant Increased Many Millions Rolls Per Year

THE Tait Paper and Color Industries has completed a large addition to the plant of the Plattsburgh Wall Paper Company, which increases the capacity of that plant from 9,000,000 to 20,000,000 rolls a year and makes the industry the most important in the city of Plattsburgh. A new building 334 by 60 feet has been constructed since June 1 and modern machinery is now being installed.

The paper used in the mill is made at the Underwood Mills on the Saranac River which was acquired some years ago by the corporation. The color is manufactured by the Imperial Color Works, another branch of the Tait Industries, and is a product of the Imperial laboratories, developed during the war. The fourteen printing plants in the Plattsburgh mill will be operated by electricity and all belting and shafting have been eliminated.

It is estimated that the corporation has an investment of over a million dollars in Plattsburgh and the annual pay roll is over $250,000. Plattsburgh people attested their faith in the enlargement of the plant last spring by subscribing $75,000 bonds of the company.

More Pulp Being Cut

According to Hon. T. W. Lyons, Minister of Lands and Forests for Ontario, more pulp is being cut by settlers off their homesteads and by operators and paper companies off their limits in Ontario, than has been the case in some years. "Reports coming to us are that individual workers are turning out a greater cordage per week than in any former years," said the Minister, "and an extra half cord per day means a big increase in the total production. There is still room for more men and in no place in the north is there a labor shortage." It is stated that the increase per capita production of pulpwood is due to this year's substitution of English-speaking labor for the foreigners who formerly filled the field.

* * *

Daniel McLarty Dies

The death took place in Ottawa a few days ago of Daniel McLarty, aged 53 years. The late Mr. McLarty was well known in pulp and paper circles in Canada and of recent years had been associated with J. R. Booth, the veteran lumber king at Ottawa and Hull.

* * *

Now Sales Manager

E. C. Martin, who has been connected with the sales end of the Interlake Tissue Mills, Limited, at Toronto for some time, has been appointed specialty sales manager of the company and will have charge of advertising. Mr. Martin is widely and favorably known in paper trade circles in Ontario and has spent most of his business career in the tissue specialty field.

CANADA MILLS GETTING ENGLISH ORDERS

Much Pulpwood Being Shipped Abroad—O. J. Klein Company Gets Handsome Order

ACCORDING to Charles Maurice, analyst in the employ of the Chicoutini Pulp and Paper Company, Canadian pulp is held in high favor in Great Britain. Mr. Maurice was sent to England by his company, to make some tests of pulp manufactured at the Chicoutini mills, and interest English paper men in the company's product. He said, Canadian pulp is enhancing its prestige in England among newsprint manufacturers. The Chicoutini Pulp and Paper Company is making a drive to increase sales in England, of the company's pulp.

The O. J. Klein Company of Campbellton, N. B., announces having secured contracts for supplying 360,000 cords of pulpwood, to be shipped thirty-six thousand cords yearly. The shipments will be made to pulp and paper mills in central New York state. The wood will be purchased from farmers in New Brunswick and Quebec, and also on pulpwood lands recently purchased by the company. O. J. Klein of the company recently returned from a tour of New England and New York state, and it was on this trip he obtained the pulpwood contracts. The fulfilment of these contracts will result in much benefit to the settlers of New Brunswick and Quebec, particularly to the farmers who depend on their pulpwood sales to tide them over the lean sections of each year. The prices obtained by the farmers on these contracts are much higher than the prices offered by Canadian pulp and paper companies. Many of the farmers have absolutely refused to sell pulpwood to Canadian firms because of the important difference in price. In some instances, United States buyers are offering one hundred per cent more than Canadian buyers. Naturally, the Canadian buyers are disgruntled, and in favor of the embargo. However, there will be no embargo, as the farmers are ninety per cent in vigorous opposition to such a measure. As a matter of fact at least fifty per cent of the farmers would leave their farms if the American pulpwood market were closed to them. Their pulpwod sales have brought more revenue than their farming operations. Advocates of the embargo apparently, overlook the strength of the agricultural element. If fifty per cent of the farmers should leave their farms Canada would be in a sorry predicament indeed.

* * *

Hackson Very Confident

According to A. H. Hackson, Crown Timber Agent at Saulte Ste. Marie, Ont., the timber and pulpwood prospects in that locality are for a slightly larger cut than usual during the present season. Most of the companies are quite busy and the weather has been favorable for woods operations, while there is no shortage of competent scalers.

COMPENSATION BOARD MEETS MILL MEN

Rates Have Grown So Exorbitant That Some Action Was Deemed Necessary

THE Workman's Compensation Board of New Brunswick was the subject of a conference held in St. John, N. B., recently betwen pulp and paper executives of New Brunswick, and representatives of the provincial government including the premier. For the past two years, the pulp and paper men, in conjunction with the lumbermen of New Brunswick have been requesting just such a conference. The rates of the compensation board have grown so exorbitant and the attitude of the politicians comprising the board and their employees have become so obnoxious, that the pulp and paper men have been unable to compose themselves.

A request was made at the conference that the rates to pulp and paper manufacturers for factory and woods operations be substantially reduced. It was pointed out that the pulp and paper industry, which is one of the essential industries of the provinces in the east, was being discriminated against in the province of New Brunswick by the hostile bearing of the New Brunswick Workmen's Compensation Board. Not content with continuing the rates in effect last year, the board increased the rates. The pulp and paper men and the lumbermen have decided to merge with the employers in general and demand improved relations with the compensation body. There are many among the pulp and paper executives who believe the principle of compensation as adopted by the New Brunswick Workmen's Compensation Board is beyond all reason and should be attacked openly by employers.

Among the pulp and paper men attending the conference were: Angus McLean, president and general manager of the Bathurst Company, operating pulp and paper mills at Bathurst; Donald Fraser, vice president of Fraser Companies, operating pulp mills at Edmunston and Chatham; J. W. Brankley, president of the Miramichi Lumber Company of Chatham; H. E. Beedy, vice president and general manager of the Nashwaak Pulp and Paper Company of St. John; W. H. Priest of Dalhousie; J. S. Scott of Fredericton; D. A. Stewart of Campbellton; W. R. Snowball of Chatham; Arthur Culligan of Culligan; D. P. Sullivan of Renous; W. E. Golding of St. John; W. H. Miller of Campbellton. In attendance at the conference were also the members of the compensation board and representatives of labor unions. Amendments to the act have been asked by pulp and paper men.

* * *

New Company Formed

A new company has been formed in Toronto to handle waste paper and rag stocks. It will trade under the name of the Union Waste Paper Company, Limited. An Ontario charter has been secured and it authorizes the company also to engage in paper and pulpwood operations. The authorized capital is $40,000.

To Make Artificial Silk

The announcement that Messrs. Courtaulds, Ltd., of London, England, one of the largest manufacturers of artificial silk in the world, have purchased 240 acres of land near Cornwall, Ont., where they will build a plant for the manufacture of artificial silk, is of interest to the pulp and paper and allied industries. Canada possesses large quantities of the raw material, cellulose, in the form of pulp wood, which is the basis of the vicose method of treatment, the development of which in Europe, has resulted in appreciable quantities of Canadian wood pulp being imported in to France and Italy for use in their factories. The great advantages that Canada holds out for this industry have long been recognized, and it is believed that the handicaps have now been pretty well overcome. The establishment of this industry in Canada would add another to her growing list of manufacturing enterprises, which have done so much to build up her export trade, especially since the War.

* * *

Gets $750,000 for Rights

The Finch Pruyn Company of Glens Falls has been awarded $750,000 for the timber rights on the property around Lake Colden, which has been taken over by the State for the Adirondack Park. The Finch Pruyn Company purchased the timber from the McIntyre Iron Company, and when the State took over the property settlement had to be made in regard to the contract existing between the two concerns. Finch Pruyn Company claimed for $960,000. George S. Ostrander of Saratoga Springs appeared for the above named company and Deputy Attorney General Benjamin McClung represented the State.

* * *

Fort Francis Company in Suit

The Fort Francis Pulp and Paper Co., has entered suit to recover from 14 other pulp and paper companies the difference between the Canadian fixed price for all newsprint supplied to Canadian publishers, in excess of the due proportion of the plaintiff during 1918 and 1919, when the price of newsprint was under Government control; Spanish River, Abitibi, Brompton and Laurentide are among the companies sued.

* * *

400,000 Cords of Pulpwood

The pulpwood cut of Ontario in 1923 was 400,000 cords, as against 300,000 in 1922, according to the report of the provincial minister of lands and forests. In addition, 200,000 cords were cut from settlers' lands. The 400,000 cords cut was from crown lands. The work of estimating the forest wealth of the province by detailing cruises is being continued.

* * *

To Study Yields

The Southern Forest Experiment Station has arranged with the Great Southern Lumber Company for a cooperative study of yields from southern pine for pulp. A block of 200 acres has been set aside for various methods of cutting, and trees on adjacent land have been tagged for observation on the increased growth following cutting operations near at hand.

A LAUGH A WEEK

A Good Joke On a Paper Trade Man

$5.00 for Each One Used

THIS WEEK'S WINNER

H. E. FULLER,
Holyoke, Massachucetts

The late Moses Newton of the famous family of Newtons who built Holyoke paper mills and operated many of them had a dry humor that appealed to his many friends. When the Crocker-McElwain company first started it was reported to Moses that it cost a big sum for them to "break" into the paper market.

"H—ow— much did it c-o-s-t?" drawled Mr. Newton.

"About $60,000," answered his informant.

"Wh-ee-w," ejaculated Mr. Newton. "We-el-l," he drawled, "you know we all have to pay our initiation fee."

Fire at Kapuskasing

The town of Kapuskasing, Ont., was badly swept by fire a few days ago and damage done to the extent of $100,000. Owing to the distance it was some time before the Spruce Falls paper mill could be reached to sumon aid. The Spruce Falls Company immediately rushed their locomotive and hose to be connected to the C. N. R. water tank, but by the time they had reached the scene of the fire eleven buildings had been burnt to the ground.

Kapuskasing is some little distance from the town site being constructed by the Spruce Falls Company in connection with their pulp industry there.

* * *

New Bleached Sulphite Plant

Plans have been prepared and equipment ordered for a ninety-ton bleached sulphite plant, the building and machinery for which will cost from $800,000 to $1,000,000. This plant will be erected at Prince Rupert, B. C., by the Prince Rupert Sulphite Fiber Company, Limited, which recently purchased the Emerson mill and timber limits. The proposal is to erect at Prince Rupert eight concrete buildings, the plant to be just twice the size of that at Swanson Bay and the whole to employ about 700 men. It will take seven or eight months to get the equipment, some of which has been ordered in Europe. In the meantime the site will be prepared and the buildings erected.

* * *

A lot of us are still thinking in the horse and buggy age. —*Tree to Trade.*

Ontario Company Busy

Production at the plant of the Ontario Paper Company at Thorold, Ont., which supplies paper to the Chicago Tribune, has been slightly over that of 1922, according to a statement by Warren Curtis, the manager. Prices are the same, all of the plant's production having been sold. "We think there will be a slight falling off in consumption in 1924 and possibly some reduction in newsprint prices," said Mr. Curtis. "The cost of raw material during the year, consisting of wood sulphur and limestone, has been practically the same as last year and coal has been somewhat less than last year. The labor situation is easy, there being lots of applications. Efficiency is better and wages are up ten per cent from last year."

* * *

Fire Caused Damage

Fire, which broke out in building on Jarvis Street, Toronto, a few days ago, occasioned damage to the extent of under $500 to the J. H. Mann Wax Paper Company. The company occupied two floors of the building and considerable damage was done by smoke and water before the flames were extinguished.

* * *

Fox Valley Men Optimistic

The papermaking industry of the Fox River Valley, now emerged from the usual seasonal dull period, has a bright future for 1924, according to leaders in the industry. The season just past was the first in recent years to show a continual shipment of pulpwood to the mills. There was no interruption in spite of handicaps. The mills found it necessary during part of the season to use auxiliary steam power because of low water, permitting only a 39 per cent normal draw in September and October.

* * *

Speaks on Forest Conservation

Addressing a public meeting in Toronto on the subject of forest conservation, Hon. Clifford Sifton, Chairman of the Conservation Commission, said: "Forty years ago any one who suggested that the supply of white pine would give out would have been hooted at, but today there is practically no white pine remaining, and what has happened to white pine will happen to pulpwood if no effort is made at conservation. The forests have been a great source of wealth to Canada but since the supply of trees was considered inexhaustible no effort has been made to conserve them.'

* * *

Woods Operations Proceeding

J. P. V. Fagan, superintendent of the Spruce Falls Company's paper plant at Kapuskasing, Ont., has been in Toronto for a few days, having reached the city after a visit to a number of the western and Ontario pulp and paper mills. Mr. Fagan says that the woods operations of the company are going along nicely and already a good start has been made in getting out the 50,000 cords of wood which is the objective this year. About forty per cent of the wood is being taken out by settlers.

W. A. Munro

Washington Pulp & Paper Corporation,
Port Angeles, Washington

Says:

DEAR MR. KEENAN:

Received the copies of "PAPER" and thank you very much for sending them. I was very much surprised at the improvement in the general make-up of "PAPER" and wish to congratulate you upon the same.

Very truly yours,

W. A. MUNRO.

FORESTRY in the PAPER INDUSTRY

PULPWOOD REGIONS OF UNITED STATES

Senators Urge More Protection of Timber for Pulpwood Purposes

IN addition to the presentation of a bill providing in specific terms for a national forestry policy, the Senate Select Committee on Reforestation has filed a report going into some detail as to the results of its nation-wide investigation of the forestry situation. The report is unanimous, but Senators Moses and Couzens united in a special recommendation that the federal government should make such modifications in its income taxes as will encourage the protection and growing of timber on private lands. They favor the deduction from taxable income of all expenditures for fire prevention and reforestation. The present laws limit such deductions to outlays for the conservation of timber, but not for forest nurseries and replanting.

The bulk of the report is devoted to a review of the present forest and timber supply situation. The original reports involving important pulpwood regions are summarized below.

Northeastern States

Original forest acreage, 108,000,000 acres. Now produces only 30 percent of its lumber consumption and pays $65,000,000 annually in transportation charges. The original pine is nearly gone, little hemlock remains, and accesible spruce is largely depleted. The paper industry of these states utilizes 60 percent of all the nation's pulpwood, and draws from Canada one third of its supply. This is one of the most critical problems in the entire country, as the paper industry in these states has a capitalization of $565,000,000 and is responsible for 53 percent of the United States paper production. There are now 19,000,000 acres of second growth, and about the same amount of young forests, with 12,000,000 acres of denuded and unproductive land. This region has more reforestation and better fire prevention than any other.

Lake States

Original forest area, 103,000,000 acres. Only 8 billion feet or the original stand of 350 billion remain. These states are dependent for 47 percent of their lumber on outside sources, and pay $30,000,000 annually in transportation charges. These states produce 22 percent of the paper made in the country, and only 5 percent of the pulwood is imported. Fire damage has been heavy, with the result that second growth is poor. Present forest area, 57,000,000 acres, of which 10,000,000 acres are virgin and one third is barren, with 26,000,000 acres bearing second growth. Very little land is being reclaimed through reforestation.

Southern States

Original forest area, 130,000,000 acres. Lumber production declined 30 percent since its peak in 1909. Large opportunity for reforestation on commercial scale.

Central and Southern Hardwood Region

Original acreage of 339,000,000 reduced to 124,000,000. Produces 40 percent of its lumber consumption, and pays a freight bill of $120,000 annually.

Rocky Mountain Region

Still in the pioneer stage, containing 38,000,000 of its original 64,000,000 acres of virgin forests.

Pacific Coast States

These states contain 60 percent of the virgin softwod timber yet uncut. The federal government owns about 54 per cent of the forest area. Fire prevention is well organized. There is little reforestation, but physical condition favor commercial timber growing.

National Summary

Original forest area, 822,000,000 acres; remaining virgin forests, 131,000,000 acres; second growth, 250,000,000 acres; burnt off and barren, 81,000,000 acres; natural forest or potential forest area, 469,000,000 acres. Forest fires in 1922 burned 8,000,000 acres, with loss of $17,000,000. Land ownership of the 469,000,000 acres is as follows: Federal, 89,000,000 acres; States, 8,700,000 acres; Cities, 400,000 acres; Private owners, 371,000,000 acres, including 150,000,000 acres in private woodlots. Total planted growth, 1,500,000 acres.

* * *

A Jack Pine Query

"Have we come to the point where there is a sufficient differential between the price of good woods and jack pine to overcome the general prejudice of the manufacturer or pulp maker and warrant his undertaking the extra trouble which its use would necessitate?" is the question asked of the Woodlands Section of the American Paper and Pulp Association by John D. Rue, of the Forest Products Laboratory at Madison, Wis., and he adds the further question:

"Even though that differential has been reached, have you arrived at a point technically, where it could be handled in the mills?"

He believes that such a study should be conducted co-operatively by the mills to determine the suitability of this species for the manufacture of pulp.

* * *

Cordage Company Men Visit Nepco

Ten representatives of the General Paper and Cordage Company of Pittsburg, Pensylvania visited the plants of the Nekoosa Edwards Paper Company at Port Edwards and Nekoosa, Wisconsin, on Wednesday, January 8th, 1924, arriving from Wisconsin Rapids early in the day and after inspecting the Nekoosa Mill had a luncheon at Port Edwards Hotel taking in the Port Edwards Mills in the afternoon.

The party was headed by Laird Warner a former Wisconsin Rapids boy. They had a great time renewing acquaintances among the superintendents, foremen and workmen of the two plants, many of whom attended the grade and high schools the time he was a scholar.

APPLYING FORESTRY METHODS NOW

Philip T. Coolige Writes Interestingly on Using Forestry in the Pulp Industry

AN interesting review of the application of forestry methods to pulpwood operations has been prepared by Philip T. Coolige and has been distributed to members of the Woodlands Section of the American Paper and Pulp Association. Mr. Coolige says:

"In paper or pulpwood companies which have established a forestry department, the work of this department is co-ordinated directly with the logging operations. The work of the forestry department is to determine the quantities and character of the timber, and the character of the topography and streams, in reference to the bearing of these matters upon logging operations. This information makes possible estimating the cost of operations from year to year. The quantity of timber available in any logging unit or watershed, the length and character of the main roads necessary, the methods of yarding, location of camp, and other details of the operations are determined by the forestry department. The information is comprised in reports and maps, so that it is possible to plan the operations from year to year with a view to practical economy. The forester would also determine what stands are most in need of cutting, and in what stands cutting can be postponed, without chance of loss through windfall, insects, or on account of an overmature condtion of the timber. This information facilitates full utilization of the timber available, and eliminates the waste of the raw material of the woods through natural causes.

Now Make Clean Cut

"The greater part of the pulpwood operations now make a clean cut of the timber on any area. This secures complete utilization, and eliminates loss by windfall of trees left standing after logging. In the spruce region, good reproduction generally follows clean cutting, so that a future cut of timber assured if adequate fire protection is maintained.

"Where pulpwood species occur in mixture with hardwoods, and are well rooted, the chance of loss by windfall is slight. A number of companies cut spruce to a diameter limit, generally ten or twelve inches, on such lands, so that in the long run the yield is increased. Moderate cuts of pulpwood can be secured every twenty or thirty years, whereas on lands which are clean cut, it would be necessary to wait fifty or eighty years for a second cut. A forester would determine on what areas diameter limit cutting, if practical for economic logging, would be advantageous as a means of increasing the supply of pulpwood.

"Many companies are buying additional lands from time to time. It is the work of their forestry departments to estimate the timber on lands offered for purchase, and to determine its value.

Head of Fire Protection

"The work of forestry in making provision for a permanent supply of timber for any manufacturing company consists primarily in fire protection. Many companies already know definitely the amount of timber available either on their own lands, or available for purchase from other lands accessibly located. All general information at the present time indicates a limited supply of pulpwood available in the North-eastern United States and Canada, so that practical measures for the conservation of this timber are necessary for the permanence of manufacturing enterprises. Dollar for dollar, more timber can be produced in the woods by fire protection, than in any other way. All other phases of forest conservation will be subordinate for an indefinite period. The success of reforestation, for example, depends absolutely on maintenance of adequate fire protection. More timber can be produced by complete protection of the natural growth, than by reforestation with insufficient protection.

"Fire protection is a broad subject, and require different measures in different places. It may require more or less publicity work, it may require legislation and law enforcement, in reference to railroad companies, campers, and others. Fire protection requires adequate measures for discovering forest fires, effective organization to get fire fighting crews on the ground as quickly as possible, adequate supplies of tools, etc. Fire protection is ordinarily an important phase of the forester's work."

Count Working in Paper Mill

Found—a count working in a Fitchburg, Mass., paper mill as a mill hand.

He's Count von der Weide.

Baron Jean de Montenach, secretary of the League of Nations; is a cousin to the count. He recently married Helen Gould, daughter of Frank Gould.

His ancestry in the Swiss nobility can be traced back to the days six years after Columbus discovered America. At the outbreak of the French Revolution his family dropped the use of the title. The World War and consequent financial reverses brought young Jean to this country.

Two years ago the youth bade good-by to his aged mother and father and sailed for this country. He spent his first six months in New York and in the Western States. He then came to Fitchburg, where he was employed by the Fitchburg Paper Company as a mill hand. Jean can be found any day at the mill learning every detail of the paper business.

"America is the greatest country in the world," he says.

His reason, he says, for learning every detail of the business is because some day he may return to his own country and, with a financial backing, may establish himself in the paper business there.

Advertiser Predicts Big Expansion in 1924

An optimistic view of the coming year from the viewpoint of advertisers is expressed in a forecast issued by William M. Rankin, president of the William H. Rankin Company, of 1 West Thirty-seventh Street, with branches in Chicago, San Francisco, Akron, Toronto and London.

Mr. Rankin calls attention to the lessening of unemployment, higher prices for crops, lower production costs and the general tendency toward business expansion as an indication of unusual prosperity during 1924. He points out to advertising men that their field of sale is 110,000,000 persons in the United States who occupy 3,700,000 miles of territory and possess wealth estimated at $300,000,000,000.

BASIC REGULATIONS IN LAKE STATES

Summary of Various State Laws Made by Woodlands Section of Association

IN making a summary of laws regarding the cutting of state owned timber in the Lake States, the Woodlands Section of the American Paper and Pulp Association reports the following basic regulations for such cutting.

Wisconsin: There are no particular regulations at the present time, and there have been no sales of state-owned timber for about ten years. Prior to that time the timber lands were sold outright to be exploited at the best advantage by the purchaser.

Michigan: The only specific laws that have been enacted in this connection are such that permit of cutting only dead and down timber with provision for brush disposal as directed. In the latter case all that is required is lopping and scattering. All the lands composing the state forests have been acquired through non-payment of taxes. It naturally follows that practically all such lands bear no merchantable timber, and as consequence there is com paratively little material of merchantable size.

Minnesota: No timber shall be cut on state lands which is less than 8 inches in diameter at a point on the tree 24 feet from the ground. No trees shall be cut which have the letter "S" stamped thereon. In many sales that have been made there is a considerable amount of young, thrifty timber of a larger size than the above described diameter. In these cases the trees are reserved by stamping them with the letter "S." Tamarack timber suitable for ties shall be cut into ties to a point where the tree is 8 inches in diameter. All tamarack is to be utilized to 6 inches in diameter. Cedar ties shall be cut to 8 inches in diameter at the small end. Cedar posts sholl be cut in 7 foot lengths. Any cedar timber cut into lengths between 8 feet and 18 feet inclusive shall be sold at a price based upon the market value of the timber when cut. Cedar sold as cedar poles and not sold at a graduated price per pole shall be cut as follows:—Trees 5 inches in diameter at 2 feet from the ground may be cut into 20 foot poles or posts 7 feet to 10 feet inclusive. Cedar timber of a longer length as far as practical shall be cut into cedar poles. In the cutting of spruce timber, all spruce trees 10 inche sor over in diameter 2 feet from the ground shall be cut as log timber to a point where the trees are 8 inches in diameter. The balance of the tree shall be cut into pulpwood. All timber that is sold shall be cut clean, acre by acre, without damage to other timber. All slashings resulting from the cutting of said timber shall be disposed of in the manner and within the time prescribed by the State Forester or District Forest Ranger.

* * *

New Record Established

A new production record for the plant of the Western Board and Paper Company in Kalamazoo was established Thursday, January 10, when the various divisions turned out 79 tons of board during a twenty-four run. The company reopened December 19 after having been shut down almost three months for extensive improvements and additions. The average production per day in recent years had been 50 tons. The company confidently expects that during the spring and summer runs of from 85 to 100 tons will be common.

Don't spend so much for the diamond that you can't afford a manicure.—*Tree to Trade.*

FINNISH PAPER DULL

Prices Obtained on Many Classes of Paper Claimed Not to Cover Production Costs

THE situation in the Finnish paper industry has been becoming more and more difficult each month during this year, owing it is said, no so much to the lack of demand as to the fact that prices are so low on many classes of paper that they do not cover production costs, according to a report from Consul Leslie A. Davis, Helsingfors. Manufacturing for stock has practically ceased. Many mills have consequently diminished production and one or two have discontinued operations.

The basic cause for this depression is said to be the close conception on the part of Canadian, Norwegian, Swedish, Austrian, Czechoslovak, and German mills, whose production costs are said to be lower. Manufacturers report poor markets for all kinds of paper—kraft and wrapping, for which until recently there has been some demand, as well as for high-grade paper and newsprint, for which the market has been dull a long time. Increased sales, however, have been made in China and some recent inquiries have been received from Japan.

According to official statistics, the total amount of paper shipped from Finland during October amounted to 15,064 tons, compared with 13,634 tons during September and 17,098 tons in October, 1922. The total exports of paper during the first ten months of this year has amounted to only 144,932 tons, compared with 160,892 tons during the corresponding period last year.

Exports of mechanical ground wood in October showed a considerable increase, although the market is still said to be dull. The total exports of mechanical ground wood during October according to official statistics amounted to 11,582 tons and those of cardboard to 2,058 tons. During September, 1923, exports amounted to 4,138 tons of pulp and 1,952 tons of cardboard.

The prospects for chemical wood pulp are thought to be better, although there has been no change in the situation yet. The exports of the Finnish Cellulose Association in October were reported as 14,208 tons, of which 9,953 tons were sulphite and 4,255 tons were sulphate. This is somewhat greater than the figure given in the official statistics which report the total exports for October to be only 13,003 tons, of which 9,119 tons were sulphite and 3,884 tons sulphate. According to the Finnish Cellulose Association more than half of the exports during October went to the United States and England.

PAPER MEN ACTIVE IN SOLVING PROBLEM

Association Appoints Number of Leaders on Advisory Board

SEVERAL of the best known traffic officials in the paper industry were present at the organization conference of the Atlantic States Regional Advisory Board on Thursday, January 3, when steps were taken for the organization of various industries to aid in the solution of the transportation problem. The meeting, organized through the efforts of Donald D. Conn of the American Railway Association, was largely attended by representative business men. The American Paper and Pulp Association was asked to select representatives of the paper industry, and the following were invited to attend the conference: H. B. Mills, Oxford Paper Company; C. C. Furguson, West Virginia Pulp and Paper Company; J. R. Williams, Claremont Paper Company; E. R. Leonhard, Paterson Parchment Paper Company; A. H. Campbell, International Paper Company; G. W. Schnell, Union Bag & Paper Corp.; and C. L. Whittemore, secretary of the New England Pulp and Paper Traffic Association.

CONSTRUCTION NEWS

A Summary of Vital Facts Regarding Construction, Finances and Operation of Paper Mills

Wells River, Vt.—The Adams Paper Co., manufacturer of kraft and manila tissues, has work under way on an addition to its plant, including improvements in the present mill. The new structure will be one-story, estimated to cost approximately $75,000, and will provide for considerable increase in current output, now averaging 10,000 pounds per day.

Watertown, Wis.—The Rock River Paper Co., is considering the erection of a new plant, to be one-story, 80x190 ft., estimated to cost close to $50,000. It is purposed to select an architect to prepare detailed plans at an early date. W. C. Stone, Bank of Watertown Building, heads the company.

Indianapolis, Ind.—The C. P. Lesh Paper Co., 121-25 Kentucky Avenue, paper merchant and jobber, has acquired property at Senate Avenue and New York Street, aggregating about one-fourth of a block, as a site for a new plant. Plans will be prepared for the structure in the near future, to be from four to six-story high, estimated to cost in excess of $100,000. It is purposed to more than double the present floor area. The existing works will be removed to the new location. C. P. Lesh is president.

Moss Point, Miss.—The Southern Paper Co., has commenced extensions and improvements in its local mill to provide for considerable increase in output. Additional equipment will be installed. The company has also arranged for the complete electrification of its plant, replacing all former steam-operated machinery.

Fort William, Ont.—The Fort William Paper Co., has preliminary plans for the construction of a new mill, to consist of pulp and paper units, power house, machine shop and other structures, estimated to cost in excess of $2,000,000, including equipment. It is purposed to commence work in the near future.

Moss Point, Miss.—The Southern Paper Co., is enlarging its plant, and will electrify the entire factory.

Chicago, Ill.—The Great Lakes Wallpaper Mills, Inc., Foster Avenue, has leased space in one of the buildings of the Central Manufacturing District, totaling about 15,360 sq. ft. of space, at an annual rental stated at $5,376. The extension will be used for warehouse service for the time being.

Portland, Ore.—The Portland Pulp & Paper Co., 815 Broadway Building, Roy H. Mills, president, is perfecting plans to commence construction of its proposed new pulp and paper mills on site selected on the North Portland harbor, late in March or early in April. The initial plant will consist of ten buildings, with equipment to provide for the handling of about 50 tons of material per day. A power house will be built. The new mill is estimated to cost approximately $1,200,000 with machinery, and is expected to be ready for service by the close of the year. The company was organized recently with a capital of $1,500,000.

Port Arthur, Ont.—The Provincial Paper Mills, Ltd., 56 University Avenue, Toronto, has tentative plans under advisement for extensions in its local mill. It is proposed to erect new buildings to double, approximately the present output, averaging 20 to 22 tons per day. The expansion, with machinery, is estimated to cost close to $200,000.

Monroe, La.—The Brown Paper Mill Co., Inc., Orange Tex., now building a local mill, has awarded a general contract to the Morton C. Tuttle Co., Park Square Building, Boston, Mass., for the erection of an administration building at the plant, for which foundations will be laid at once. James Gamble Rogers, 367 Lexington Avenue, New York, is architect.

Roaring Springs, Pa.—The D. M. Bare Paper Mill Co., plans for extensions in its plant, including the installation of considerable equipment, estimated to cost close to $115,000. Operations will be commenced at an early date. E. G. Bobb is general manager.

Dallas, Texas—The plant of the E. C. Palmer Paper Co., has been damaged by fire to the extent of $150,000.

St. Augustin, Que.—The St. Regis Paper Co., Watertown, N. Y., is perfecting plans for the construction of a new pulp and paper mill on local site. The plant will consist of a number of buildings, with power house and machine shop, estimated to cots close to $3,500,000, with equipment.

Chicoutimi, Que.—The Chicoutimi Pulp & Paper Co., Ltd., has plans for a new mill for the production of pulp fiber for newsprint production and is said to be arranging for equipment purchases in the near future. The estimated cost of the project has not been announced.

Philadelphia, Pa.—The George W. Plumly Co., 213 North Fourth Street, manufacturer of paper boxes for druggists' service and other purposes, has had plans prepared for the construction of a new addition for general increase in output, including alterations and improvements in the present structure. Bunting & Shrigley, 603 Chestnut Street, are architects.

Antioch, Cal.—Fire, Jan. 1, destroyed stock and material at the local plant of the Paraffine Companies, Inc., manufacturer of paper products, with loss estimated at close to $30,000. The company's plant, it is understood, was not materially affected, and operations will proceed on a regular basis.

New Companies

Syracuse, N. Y.—The Arcadia Safety Carrier Co., has been incorporated with a capital of 600 shares of stock, no par value, to manufacture paper cartons, boxes, etc. The incorporators are W. B. McCowen, M. Koppelman and J. P. Goettel. The company is represented by E. F. Fox, Newark, N. Y.

Roanoke, Va.—The Universal Envelope & Printing Co., has been incorporated with a capital of $25,000, to deal in paper products. L. W. Harvey is president, and T. S. Wright, secretary, both of Roanoke.

Brooklyn, N. Y.—The Pak-It-Rite Paper Box Co., Inc., has been incorporated with a capital of $100,000, to manufacture paper boxes and containers. H. M. Levy, 41 Porter Avenue, Brooklyn, is the principal incorporator.

Louisville, Ky.—The Shawnee Wall Paper Co., has been organized to manufacture and deal in wall papers and other paper products. The company is headed by H. L. Potts and L. D. Greene, both of Louisville.

New York, N. Y.—Cymrot & Cymrot, Inc., has been incorporated with a nominal capital of $5,000, to manufacture paper boxes and containers. The incorporators are J. and S. Cymrot, and S. I. Sklar. The company is represented by M. Cymrot, 593 Barbey Street, Brooklyn.

Financial

Carthage, N. Y.—Creditors of the Carthage Sulphite Pulp & Paper Co., have made application for a receiver for the company, naming J. Victor Baron, Watertown, N. Y., and Charles E. Norris, Carthage, attorney, as desirable parties to engage in such capacity. Claims against the company are said to aggregate $100,000.

St. Maurice, Que.—The St. Maurice Paper Co., is arranging for a sale of capital stock to increase its gross capitalization to $10,000,000. The total amount of the present issue approximates $2,000,000.

Chicago, Ill.—A petition in bankruptcy has been filed against the Midland Paper Box Co., West Lake Street.

New York, N. Y.—Gerald Jackson is said to have been appointed receiver for the Bauer Paper Box Co., 440 Lafayette Street.

Plant Operations

Norwood, Me.—Bird & Son, Inc., East Walpole, Mass., manufacturer of roofing paper, etc., has commenced operations at its new local mill addition and plans to develop maximum output at an early date, giving employment to a full working force. The extension is expected to provide for about double the former capacity.

Kalamazoo, Mich.—Paper mills in this section are running close to normal and the majority of the plants are giving employment to full working forces. Expansion is under way in a number of instances, with construction being pushed on new mills and extensions to present plants to allow for spring operations. Incoming orders are said to insure the present working basis for a number of months to come, with anticipation of advanced output with the turn of the spring season.

Philadelphia, Pa.—The Globe Ticket Co., is commencing operations at its new local plant, recently completed, and will develop maximum production at an early date. The plant has a rated normal output of 30,000,000 tickets per day, and will permit necessary facilities for company expansion, with business showing an increase of 35 per cent during the year just closed, as compared with operations in 1922.

Dundas, Ont.—The town has secured an interim injunction against the Adams Wallboard Co., Ltd., from discharging injurious chemicals and other materials into the stream above the filtering basin, from which the municipality secures its water supply. A supreme court writ for damages for polluting the water has also been issued against the company.

Business Opportunities

The Purchasing Agent, Government Printing Office, Washington, D. C., is taking bids until Jan. 30, for one single paper ruling machine, and one double paper ruling machine.

The General Purchasing Officer, Panama Canal, Washington, D. C., will receive bids until Feb. 1, for a quantity of cardboard and bond paper, in connection with other miscellaneous materials, as set forth in Circular 1584.

The Bureau of Foreign and Domestic Commerce, Washington, D. C., has information regarding a company at Rajkot, India, in the market for a quantity of American paper and stationery, Reference No. 8769. Also, of a concern at Para, Brazil, for American machinery for the manufacture of cardboard, Reference No. 8775. Full information on request.

To Hear Paper Rate Contention

The State Railroad Commission, Austin, Tex., has announced a public hearing, Feb. 12, on the petition of the Southwestern Tablet Manufacturing Co., Dallas, for a readjustment of the freight rates applying on paper and various paper articles between different points in the state. It is alleged that certain divisions of the present schedule are unreasonable and discriminatory, and in violation of law.

Quarters for Rangers

The New York State Ranger School at Wanakena, N. Y., because of its limited capacity, has had no increase in its student body since March, 1920, but has grown steadily in public interest. Inquiries from prospective students have increased several hundred percent. within the last few years and a steady increase in the number of applications for admission is noted each year.

In addition to an increasing interest on the part of the general public there is evidence that the Ranger School is becoming better known among the employers who have occasion to hire men of the kind that the Ranger School turns out. Ranger School graduates have often found it somewhat easier to procure employment because of the favorable impression left by men from earlier classes. In a number of cases Ranger School alumni have written asking that one or more men be recommended for work which they had in charge.

Under an act of the last Legislature $200,000 was appropriated for the construction and equipment of a new building which will be large enough to house all the activities of the school. This building will not only take care of all the needs of the School for the present but, as far as can be forseen, will be of sufficient size and so equipped that it ought to satisfy requirements for an indefinite period. It can be expected that the students will be greatly benefitted and that the administration of the School and the State College Forest will be more efficient.

CONVENTION COMMITTEE OF MILL SUPERINTENDENTS MEET

Plans Are Made for a Bumper Meet in Dayton, O., in May This Year

THE Convention Committee of the American Paper and Pulp Mill Superintendents Association met at 11 A. M. Sunday, January 13th, 1924, in the English Room of the Congress Hotel in Chicago.

Peter J. Massey, general Secretary of the Association called the meeting to order and in addition there were the following members present.

H. W. Server, 5th Vice President of the Association from the Miami Valley Division.

Lloyd T. Murphy of the Miami Valley Division.

E. T. A. Coughlin, 1st Vice President of the Association from the Michigan Division.

E. H. Gilman of the Michigan Division.

L. E. Smith, Chairman of the Northwest Division.

B. T. McBain, Third Vice President of the Association from the Northwest Division.

A dinner was served in the Committee Room at 1:30 and the business of the Convention took up the entire day, adjournment being taken at 6 P. M.

The program for the National Convention to be held in Dayton, Ohio, May 22, 23 and 24, 1924, was arranged for, and all the different committees on transportation, entertainment and finances made satisfactory reports.

A large number of subscribers have already sent in their requests for advertising space in the Annual Program known as the Year Book, thus showing the value of this publication as an advertising medium, and it is expected that this program will not only be the largest but the best ever presented by the Paper & Pulp Mill Superintendents' Association.

The Dayton Automobile Club, as well as the Chamber of Commerce, Engineers Club and other public spirited organizations of the cities of Dayton and Middleton, Ohio, have expressed their willingness to aid the committee in its work and General Chairman H. W. Server is very well pleased with the way everyone is knuckling down to business to make the Dayton Convention the best yet held.

Promise of a large delegation of Technical Association members at this Convention was received from W. G. MacNaughton, Secretary of that Association and also the promise of a valuable paper by H. S. Taylor, President of the Technical Association, on steam and power matters shows that these two Associations of the Pulp & Paper Industry are more and more becoming the co-operating twin brothers that they should be and that the Pulp & Paper Industry so badly needs in times of stress.

GOVERNMENT CALLS MEETING OF PULP AND PAPER MEN

Secretary Wallace Will Meet Committee of Pulp and Paper Industry February 7

A MEETING of the committee representing the pulp and paper industry of the country has been called by Secretary of Agriculture Wallace for February 7, according to an announcement issued by the United States Department of Agriculture. Notice of the meeting, which will be held in Washington was sent to Hugh P. Baker, secretary of the American Paper and Pulp Association, New York City, and to seventeen other representatives of the industry.

This meeting is considered by forestry officials of the Department of Agriculture to be important from the standpoint of attempting to solve the timber supply and other problems now confronting American pulp and paper manufacturers and consumers.

The program of the February 7 meeting includes an address by Secretary Wallace on "The Paper Industry and National Forest Policy," an address by George W. Sisson, Jr., president of the Racquet River Paper Co., on "Co-operation Between the Industry and the Department of Agriculture," and an address by Norman W. Wilson, vice-president of the Hammermill Paper Co., on "The Future Development of the Paper Industry."

In addition, Carlile P. Winslow, director of the Forest Products Laboratory, Samuel T. Dana, director of the New England Forest Experiment Station, Raphael Zon, director of the Lake States Experiment Station, and Charles W. Boyce, forest economist, will speak on the Department of Agriculture's program of investigations concerning the growing of future crops of timber for pulpwood and processes of pulp making.

The discussions will be led by W. E. Haskell, vice-president of the International Paper Co., D. C. Everest, secretary and general-manager of the Marathon Paper Mills Co., F. C. Clark, vice-president of the Pejepscot Paper Co., and Hugh P. Baker, secretary of the American Pulp and Paper Association.

* * *

Wilbur F. Denious, receiver for the Meyer Pulp and Paper company, Denver, Colorado, has been elected a director of the Civitan club.

The Editorial Page

Cheering Up

WHAT the tumult and the shouting largely subsided, nevertheless, the farcial opinion of Attorney General Daugherty regarding trade associations and their work has been mulled and mulled in the minds of the members of those associations. They have not forgotten, although little has been said to the public.

As you know the Attorney General, in a letter to Secretary of Commerce Hoover, said all information gathered by trade associations covering production, consumption, surplus stocks and other information "may be gathered by an association provided it be strictly guarded and the association be prohibited from distributing it among its membership."

Executives of some of the local trade associations are in a quandary as to what action to take in regard to the Attorney General's opinion, and many are wondering what the next move will be on the part of Mr. Daugherty, or on the part of Secretary Hoover, who appears to take the stand in favor of the associations.

Attorneys for some of the trade organizations expressed the opinion that "Mr. Daugherty himself is making law as neither the Government nor the Supreme Court has even gone so drastically on record as did the Attorney General. Mr. Daugherty takes the stand that the trade association may make public all data collected, but only through a Government agency such as the Department of Commerce or other governmental bureaus.

"To carry out the opinion of the Attorney General would bring about demoralization in the business world, especially in small industries which rely for information upon the data collected by trade associations" according to statements. "It would put out of business entirely the 3,000 or more trade associations now operating for the benefit of the various businesses which they represent," said the attorney for one organization. "If the Attorney General carries out his plan, and the courts sustain him," it was added, "it would result in most serious consequences to thousands of business organizations in the country."

"Business needs statistics and other data concerning the various lines of enterprise in which it might be interested. The only way the average, or small company, can obtain the necessary information is through the trade association. If this is abolished then business will itself be groping blindly down dark alleys. It will have to speculate as to the current position of business and will have to gamble as to the future, which, as everyone familiar with business knows, is generally a costly undertaking."

And so it stands. All the associations in the paper industry upon the advice of counsel are going ahead with their usual procedure, uninfluenced by the ruling.

The Attorney General is saying nothing. It is well. He has said quite sufficient to last him till Gabriel bugles ecstatically.

Editorial Squibs

Pulp and paper continue to pour in from abroad. Isn't it about time for the rainbow to appear during the deluge?

—O—

Emmett J. Carey, of the Nekoosa-Edwards Company, at Port Edwards, Wis., writes that it is 45 degrees below, there. Then why should we complain?

—O—

Can it be possible that there is no tariff on paper and pulp from abroad because the powers that be are afraid of the powerful newspapers of the country?

—O—

Read that article on the opposite page headed "The War on Waste," by Tom Keenan. It isn't just a page of bromide platitudes, but real horse-sense for the paper industry.

—O—

Athur C. Hastings has promised to write an article on reminiscences in the paper trade. He hasn't a chance to escape from that promise. So you might as well begin to whet your appetite.

—O—

The Canadian Paper and Pulp Association is meeting in Montreal this week. May it learn much and profit tremendously. Many prominent people in the paper industry of the United States are attending.

—O—

A Prohibition navy to war on the rum fleet is a splendid thing. But PAPER would personally be much more elated if there was some kind of a prohibition navy to war on and prohibit these ships bringing in dirt-cheap pulp and paper from abroad.

—O—

So many kind words are filtering in from the nation about the improvement in PAPER that we are awed. We pause for breath, while we tighten our belt and roll up our sleeves one more notch to keep on building a real, representative "Magazine of the Paper Industry." Will you stick with us on the job?

—O—

Don't forget for a minute the big convention of the year, that of the American Paper and Pulp Association with its attendant Paper Industries Exposition in the Grand Central Palace, in April. Let that gathering at Montreal be a reminder to plan now to be in New York for the convention and the exposition.

The War on Waste

THERE was a time in the history of our pulp and paper industry when waste of efficient matter and of by-products was regarded as unavoidable and an accepted thing. No so now. In nearly every issue of PAPER in recent months and years preachments against waste and counsels of economy in production have appeared at regular intervals. One phase of waste prevention after another has been studied and we are now at a point where waste of men and materials also receives consideration in the study of safety appliances.

As has been pointed out by B. T. McBain, of the Nekoosa-Edwards Paper Company, in PAPER for January 17, the placing of safety attachments on machinery does not mean more than one-quarter of safety achievement because the workers are not sufficiently organized and taught to be careful; that is, instructed to cultivate the feeling for safety practices and to think safety. Careful workmen use care in the making and finishing of the products and so avoid that form of waste which means loss of men, of effort, of materials as well as the thing produced.

In the new passion for avoidance of waste of the kind discussed by Mr. McBain in his more recent contributions there is some likelihood of the larger aspects of waste being neglected. Great savings have unquestionably been effected in paper mill work through improvments in methods of reclaiming fibers and other material from white waters that were permitted to be washed away with other effluents to find a destination in running streams or waterways, before the day of save-alls and special chemical precipitants and coagulants.

Foremost among the great single losses of material stands the waste of substances contained in the liquors that have been used to extract the resins, juices and lignin that encrust the cellulose fibers, the setting free of which is the aim of the pulp manufacturer, whether he uses the sulphite, the sulphate or the soda process. The greatest apparent losses are with the sulphite process as presently operated. It has been figured out by Klason, a Swedish authority, that the spent liquors of this process contain in a metric ton of 1,000 kilos, 644 kilos of lignin, 311 kilos of carbohydrates, 15.5 kilos of proteins and 73 kilos of rosin and fats. The carbohydrates consist of sugars: pentose (xylose), 0.41 per cent; mannoe, 0.48 per cent; galactose, 0.01 per cent and fructose, 0.25 per cent. The last named are capable of being fermented with yeast, and the waste liquors can in this way be turned into a source of alcohol, as is done in a limited way by a few sulphite mills in this country and by a larger number in Sweden. Alcohol recovery from waste sulphite liquors has, however, not proved commercially profitable in the United States and it does not appear to be a paying enterprise in Sweden, as reports have come from that country of the shutting down of alcohol recovery plants that were started with very sanguine expectations.

The saving of waste by the utilization of the spent liquors of sulphite mills is a problem which is still unsolved, despite the many experiments that have been made with it for a period of more than thirty years. Spent sulphite liquor is still regarded as a useless and inconvenient waste. It has been used for the after-dressing of hides, in the manufacture of fuel briquettes, as an adhesive for binding foundry cores, as a road binder for settling dust, and as a soil fertilizer, besides being a source of ethyl alcohol.

German scientists are now studying as a new development the conversion of the waste liquor by neutralization with lime into a product which can be used as an agricultural fertilizer or manure. But twelve or thirteen years ago, when Justus A. B. Cowles was president of the Pejepscot Paper Company, he called at the office of PAPER to consult me on the possibilities of sulphite waste liquor as a fertilizing agent for increasing the growth of plants. Authorities were looked up at this time and the advice was given that waste sulphite liquor that had been previously neutralized with lime might be used with great advantage as a fertilizer of the soil. The subject has since been allowed to rest and unless our Depatment of Agriculture can be induced to do some research work for the benefit of the farmer, and incidentally the sulphite pulp mills, there is little hope of a demand being created which will relieve the mills of an ever growing source of worry.

As most of our readers know recovery processes are made use of quite generally and as a matter of routine work in soda and sulphate mills. The lime sludge of the soda process can be recovered by burning and that of the sulphate process is used to good advantage as a soil dressing by Western farmers, Carl Moe having told all about this in an illustrated article contributed to PAPER a few years ago.

Notes of the New York Trade

Edmund E. Keough has resigned as advertising manager of the American Writing Paper Company to become sales promotion manager of the Paper Utilities Company, of New York City, manufacturers of Tulip drinking cups and a wide range of paper specialties.

* * *

Announcement is made that William A. Castle has been elected president and treasurer of the recently incorporated firm of Castle & Overton, dealers in and importers of wood pulp, rag stock and other papermakers' supplies of 200 Fifth avenue, New York. Frank C. Overton has been elected vice president of the new corporation, and Carleton B. Overton secretary. The partnership of Castle, Gottheil & Overton was formed in 1901, and changed about a year ago to Castle & Overton upon the death of Leon Gottheil.

* * *

The New York Mill Supply Company, dealer in papermaking materials, has moved from 83 Mercer street to larger quarters at 151 Spring street, New York.

* * *

A. A. Silverton & Company, Inc., dealers in paper mill supplies, announce that their offices have been removed from 200 Fifth avenue, to 55-57 Mercer street, New York, telephone Canal 7381.

* * *

Jacob Erichsen, who for the last two years has served as secretary of several of the smaller associations in the paper industry affiliated with the American Paper and Pulp Association, including the Gummed, Glazed and Fancy Paper and Binders Board Manufacurers' Associations, resigned on January 15 to join the organization of Atterbury & McKelvey, Inc., of 145 Nassau street, New York, wood pulp importers. The several associations of which Mr. Erichsen was secretary have decided not to name a successor at once but have requested the American Paper and Pulp Association to handle the work for them until the annual convention of paper manufacturers in April.

* * *

A. H. Campbell, traffic manager of the International Paper Company and one of the traffic men who requested the American Paper and Pulp Association at the organization meeting on January 3 of a Shippers Regional Advisory Board for the Middle Atlantic States, has been asked to serve as chairman of the paper and pulp committee of the new organization. Leslie B. Palmer, of the American Newspaper Publishers' Association, has been named vice chairman of the committee. The function of the board will be to supply the railroads with accurate information concerning carload requirements of the shippers in the district and to co-operate with the railroads to secure adequate service. It will also endeavor to adjust difficulties between shippers and the carriers, without resort to the Interstate Commerce Commission, but will not handle rate problems.

* * *

A meeting of creditors of Chase & Norton, Inc., dealers in paper stock of 275 Water street, New York, has been called, at which it is proposed to present a plan for the satisfactory liquidation of the business of that concern. Liabilities are said to be about $10,000 and assets about $2,500. The firm is one of the oldest in the waste paper trade in New York, having been in existence for 26 years. Frederick H. Chase is president.

* * *

The investment firm of Stewart, Tuttle & Company, composed of D. S. Tuttle, A. G. Wynkoop and R. B. Suckley, has been formed recently with offices in the Equitable Building, New York, to specialize in pulp and paper mill securities and to bring out new issues of established paper and pulp companies. The concern has the facilities and connection to market such issues and to locate and maintain broad and active markets for them.

* * *

The Michigan Alkali Company, which heretofore has distributed its products, including soda ash, caustic soda and other chemicals, through the firm of Edward Hills' Son & Company, of New York, has established an office at 21 East Fortieth street, New York, and in the future will market its products through its own sales organization. The same personnel which has been handling this business will continue under the new arrangement with E. W. Taylor as general sales manager.

92 PER CENT OF PEAK LOAD OF NEWSPRINT

December Report of Newsprint Production in United States and Canada Shows Well

That the average daily production of newsprint paper in December amounted to 92 per cent of the average daily output during the three months of greatest production in 1922 is the statement made in the January Bulletin of the News Print Service Bureau.

The 44 United States companies reporting produced 117,790 tons and shipped 116,826 tons, the 20 Canadian companies produced 95,726 tons and shipped 100,624 tons, making a total production of 213,516 tons and shipments of 217,450 tons in both countries. These companies also produced 2,111 tons of hanging, of which 765 tons were made in Canada. Production in United States exceeded shipments by 964 tons and shipments in Canada exceeded production by 4,898 tons. Stocks at the end of December totaled 23,669 tons in the United States and 15,123 tons in Canada, a combined total of 38,792 tons which is equivalent to 4.2 days' average production, the Bulletin says.

Comparing production of 51 identical companies during the twelve months of 1923 with that of the same period of 1922, the United States companies show an increase of 47,628 tons or 4 per cent., the Canadian companies an increase of 181,618 tons or 17 per cent. and the total of all these companies shows an increase of 229,246 tons or 10 per cent.

The average daily production of news print paper by these 51 companies reporting for December amounted to 92.0 per cent. of the average daily output during the three months of greatest production in 1922, with allowances for changes in machines.

SUMMARY FOR ALL REPORTING COMPANIES

	Companies	Production	Shipments	Stocks
United States	44	117,790	116,826	23,669
Canada	20	95,726	100,624	15,128
Total........	64	213,516	217,450	38,782

Ten New Machines Started

There were ten new newsprint paper making machines started in 1923, according to the January Bulletin of the News Print Service Bureau. Six machines are on record already to be started in this year.

Salesmen Resume Weekly Meetings

Meetings of the New York and Chicago Divisions of the Salesmen's Association, held weekly on Mondays, at 12:30 P. M., at the Canadian Club, Belmont Hotel, New York City, and at the Old Colony Club, Hotel La Salle, Chicago, respectively, have been resumed after the holidays.

These meetings are usually attended by many of the prominent sales executives of the industry, and reports made of the existing market conditions. They provide an excellent medium for all salesmen in the industry to keep in close touch with conditions, and their usefulness is now generally recognized.

Salesmen not now members of the Association are invited to attend, as well as members located in other divisions, who may be visiting New York or Chicago at the time the meetings are held.

News from New England

GEORGE C. HENRY LEFT MUCH TO CHARITY

Well Known Pulp and Paper Man Gave Half Million Dollars to Various Charities

GEORGE E. HENRY, one of the best known paper and pulp manufacturers in New England whose death on Dec. 31 was recently announced in these columns, left bequests amounting to more than $500,000 to charity, according to his will just filed in Middlesex County, Mass. Mr. Henry was the son of James E. Henry, who founded the business of J. E. Henry & Sons Co. and founded the town of Lincoln, N. H., where the mills were for many years operated. George E. Henry succeeded to that business and also established the Henry Paper Company. These two companies operated mills for many years at Lincoln and Lisbon in New Hampshire and at Sheffield and Newark, Vermont. About six years ago Mr. Henry disposed of the mills to the Barker Young Company, which now operates them, and retired from active business life.

Hr. Henry resided in Winchester, Mass. Among the larger charitable bequests in his will are $100,000 to the Morgan Memorial, Boston, and a similar amount to be administered by the trustees of the Morgan Memorial, free from trust, to build and provide suitable homes for poor people at a cost within their reach, provided they are located in communities large enough to provide employment, culture and amusement for the people. He leaves $100,000 to the town of Lincoln, N. H., which he and his father founded, for such charitable purposes as his executors deem advisable. Bequests of $10,000 each are left to Bates College, Palmer Memorial Hospital and the National Training School at Durham, N. C.

Bequests of $5,000 each are left to Boston University, Boston Floating Hospital, Goodwill Home at Hinckley, Me.; New Hampshire Orphanage at Franklin, N. H.; American Board of Foreign Missions, American Missionary Society, Freewill Baptist Association at Littleton, N. H.; Boston Children's Aid Society; Visiting Nurses' Association; Winchester Hospital; Winchester Congregational Church; Congregational Church at Wells River, Vt.; Methodist Church and Congregational Church at Littleton, N. H.; New England Deaconess' hospital and Northfield Schools. He also makes some twenty other public bequests in sums ranging from $1,000 to $5,000. The will also provides for the payment of $6,000 annual income to his son, James E. Henry of Winchester with provision for more if required and the balance of the estate is left outright to his widow, Mrs. Bertha A. Henry. Mrs. Henry, Charles A. Dutch, town counsel of Winchester and John H. Henry, a brother, are executors. An inventory of the value of the estate has not yet been made.

* * *

Buys Northeastern Interests

The D. DeStefano Co., Damrell Street, South Boston, Mass., has purchased the assets of the Northeastern Paper Company of East Cambirdge, of which A. M. Sonnabend has been the general manager. The new owners have already taken possession and have started operating the Northeastern company's plant. The building which is acquired is five stories high with electric power, elevators, conveyor system and othe rmodern equipment. The DeStefano company is among the largest shippers of waste paper to the largest paper board mills in New England and its additional facilities now give it railroad sidings on the Boston & Maine and Boston & Albany railroads.

* * *

Francis Andrews Dies

Francis Loring Andrews, president of the Andrews Paper Company of Boston, Mass., since 1906 and active in the Boston Paper Trade for some years, died January 15 at his home, 81 Summer Street, Lynn, Mass., in which city he had resided for 35 years. He was born in Freedom, N. H. 65 years ago and 35 years ago, becoming identified with the paper business, removed to Lynn to reside. He was a member of many Masonic bodies, of the Methodist church and several trade organizations. He leaves a widow, Mrs. Lena F. Andrews.

* * *

I. P. C. Mills Closed

The mills owned and operated by the International Paper Company at Franklin, N. H., were closed for an indefinite period January 16. According to announcement made at the mills, they are closed because of orders to that effect from the New York offices of the company. About 150 employees are affected. It was also said that poor business conditions result in the closing. The Franklin plant manufactured news stock.

SAYS CANADA IS NOT TOGETHER ON EMBARGO

Forestry Engineer Says He Witnessed No Attempt for Concerted Action

MAINE pulp and paper interests are watching closely Canadian action in connection with the investigation by the Canadian parliament of the proposal to place an embargo on pulpwood. C. W. Eaton of Portland, a forestry engineer who has been a timber operator in Canada in speaking of the matter says that he saw no concerted action in Canada to press an embargo. Remarking that the proposal demonstrates the depletion of the timber resources of this country and that Canadian supplies are limited, Mr. Eaton points out that in 1919 and 1920 the pulpwood industry in Canada expanded greatly and both crown limits and freehold lands were acquired at high premiums. From the crown lands which comprise the bulk of Canada's forests, the exportation of manufacturers wood is already forbidden. The proposed embargo would affect the exportation of wood cut on the freehold lands. Many United States mills are dependent upon their freehold lands in Canada, while others look to obtain their future supply from that source. Freehold lands are today playing an important part in the paper industry on this side of the line; they have proven an ever present help in time of trouble and hold out hope for the future for those who have title. But if they should be placed on the same basis, regarding exportation, as the crown limits, they would be seriously affected.

Continuing Mr. Eaton says:

"It would work an almost prohibitive hardship on some concerns which would have to choose between the most favorable locations they could get away from the sources of raw material, or locate their mills in what are now inaccessible places, both of which possibilities put such concerns at more or less disadvantage in competition. It would profit Canada none if these incoming mills were not prosperous.

"But it is felt that a more far-reaching effect on the country as a whole would be the injury to the farmers in the timbered sections and to the land colonization plans of the government. East from Manitoba to the Atlantic the history of our own Eastern farms is repeating; the timber puts and often keeps the farm on its feet. Cutting pulpwood is one of the chief occupations of the farmer in this section of Canada. Pulpwood is the

standby product of many farms, and prosperity of the paper industry means farming prosperity.

"A very large percentage of the pulpwood from the farms is shipped to the United States. An embargo would subsidize Canadian pulpwood interests at the expense of the farms by taking American mills out of competition. And it is this competition that makes the price. In 1922, with the pulpwood market at a standstill and U. S. mills not competing, Canadian farmers were obliged to sell their pulpwood at a loss in order to get cash enough to live through the winter, and many could not find a market at any price. Yet Canadian mills in their locality cut wood from their own limits and paid more for it than they would have had to pay in the open farmer's market.

"One of the reasons for this was that these mills had their main timber supplies in their own crown limits, right to cut the timber from which has been leased them by the government under guarantee that a certain amount of work shall be done annually on these limits in the cutting of timber, and, in at least some cases, that the limits be cleared of timber in a definite number of years, after which the government opens the lands to settlement. The result is that in many sections the pulp mills can not handle the local production, yet a concern desirous of locating a mill can not do so in those sections, having no guarantee of continued wood supply even for a limited number of years.

"It is generally understood that the strides made in settling Northern Ontario in recent years, for example, are coincident with, and made possible by, the respective condition of the pulpwood market. Hundreds of thousands of cords of pulpwood have been shipped from this district to New York and Pennsylvania, from lots that have been settled on by farmers who went there to make their homes. An embargo on the remaining thousands of cords would slow up, and in many sections fully stop, the taking up of new lands by settlers, and impair the progress and prosperity of the farmers already on the ground. It is felt that the far reaching effort of this situation would go far toward balancing the conceived benefits from the embargo.

"It has been suggested that the subject of an embargo on pulpwood was brought up by public-spirited Canadians who wished to have the facts concerning Canada's timber resources given an airing after the recent boomtime slaughter of its forests, to bring emphasized attention to the fact that a decade has shown her forests are not unlimited nor inexhaustible, and, that on the contrary, cutting, fire, and insects have fast depleted them. Those vast areas of the north, which, when we look at the map we like to fancy as unbroken forests the final retreat of the wolves, bear no tree growth at all, or struggle with small stunted black spruce trees that refuse to grow. There are many square miles of burned land, on which there is no tree reproduction now ages after the fire went through, and similar extensive areas of muskeg. Closer at hand, yet inaccessible now for profitable exploitation lie the few remaining outposts of the original forests of Eastern America. In a short time economic adjustments will legislate an embargo of their own."

* * *

Trying to Make Deal

The Riordon Company, hard pressed for money, has been trying to make a deal with the Dominion Government for its income and business profits taxes that are much overdue, but without success. It has offered to turn over property formerly owned by the Edwards Company, of Ottawa; but the Government not only does not need the property, but dislikes to accept it on the ground that it might create an undesirable precedent.

ST. MAURICE COMPANY TO ISSUE STOCK

Almost Two Million Dollars Worth of Stock in New Extensions

THE directors of the St. Maurice Paper Co., have decided to make a new issue for the purpose of financing the costs of the extensions to the mill at Three Rivers, Que. This means an issue of 17,250 shares, or an addition of $1,725,000 to the stock outstanding bringing the total authorized up to about $10,000,000. The new issue will be on the basis of slightly over one to four. The Union Bag allotment of 2,500 in payment of timber limits they are transferring to the Canadian company is included in this amount. This will bring their share of the total up to about 65 per cent.

The exact terms of payment for the timber limits are not generally known. In addition to the 2,500 shares of stock, the St. Maurice Co. agrees to pay $100,000 a year for the next 10 years, or a total of $1,000-000. Taking the stock at its par value of $250,000, this would mean a total of $1,250,000, for the limits or $2,500 a mile. The addition gives the St. Maurice Paper Co. about 3,000 square miles and places it in a very strong position in so far as wood supplies are concerned.

The addition of two new machines for the manufacture of newsprint by the St. Maurice Co. will rather more than double the present production, bringing it up from 120 to about 250 tons daily. They will complete the present equipment of the Three Rivers plant. The new plants of the company have an important bearing on the Canadian newsprint situation. In some quarters there is an impression that the addition of these machines, together with others added last year, and the coming in of others in the near future, will meet all the demands of the market. It is true that practically all Canadian plants have contracts for their entire output covering the first half of the year, but there is no likelihood of either the demand or the price becoming any stronger than it now is.

* * *

Personal

James Brown, of the J. L. Morrison Co., Limited, King Street, Toronto, manufacturers of paper mill supplies, has returned from a business trip to Dover, New Hampshire, where he visited the Kidder Press Company in which he is interested. He reports the outlook for business in 1923 as good, both at the Toronto and the Dover plants.

George C. Winlow, Toronto, sales manager for the Lincoln Paper Mills Company, Limited, Thorold, Ont., was severely injured in a railway wreck at Belleville, Ont., a few days ago and will be confined to a hospital in Toronto for some days yet as the result of a number of broken ribs.

R. A. Garrett, formerly of the Denison Manufacturing Company, Toronto, has joined the selling staff of the Interlake Tissue Mills, Limited, head office Toronto, and will be engaged in selling the new Interlake line of superfine crepes.

The Government at Ottawa has turned down the proposal of the Riordon Company to take over extensive property formerly owned by the Edwards Company in Ottawa in lieu of taxes due by the Riordon concern to the Government. It is stated that the property is not needed and if it were, tax payments in the way would open up a questionable precedent.

STORAGE DAM WILL AID PAPER MILLS

Industries Along the Kennebec River Will Be Greatly Benefitted

THE announcement is made that work is be started immediately on the construction of a large storage dam on Moose River, a tributary of the Kennebec, below Brassua Lake in Maine. This is an important announcement for two reasons, one that it means that in the near future there will be a more adequate water supply for the industries along the Kennebec River, the other that it will put a stop to the endless discussion over the proposal for a storage dam in the Dead River section which caused such a sensation at the last session of the legislature. Because the state holds certain lands in trust at Dead River it became necessary to obtain legislative sanction for the storage project at that place. The legislature voted to grant the requested charter but the bill was vetoed by Governor Baxter. Some changes were made to suit the Governor and then the legislature refused its sanction and the matter was dropped much to the indignation of the Kennebec people.

Among the parties chiefly interested are the Great Northern Paper Co., with its mills at Madison, the Hollingsworth & Whitney Co., the Central Maine Power Co., and the Lockwood Mills. It is understood that these interests and others are jointly interested in the construction of the storage dam at Brassau. The Kennebec has been very low the past winter and the improvement is greatly needed by the industrial concerns.

A careful survey of the river valley has been made and it is estimated that as much water can be stored at Brassau as in the Dead River section and there will not be great difference in the expense of construction.

* * *

To Tap New Market

The Wayagamack Pulp and Paper Company, Limited, which already exports about seventy-four per cent. of its production from its mills in Quebec province, is now preparing to tap a great new market with kraft and wrapping papers. The company's sales manager sailed for France a few days ago to establish a sales agency in that country and will be followed in a couple of weeks time by F. I. Ritchie, the general manager. The move is significant because of the indication it gives of the high standing of Canadian papers in foreign markets. While price will be the factor in the selling of Canadian kraft in France, it is nevertheless true that the Canadian product can be sold at a higher price than many European krafts with which it will come into competition. At the Wayagamack's Three Rivers plant paper for export is packed under hydraulic pressure until the bundle is as practically as solid fibre and cannot be damaged by water or weather.

* * *

Expect Large Earnings

It is expected that Brompton Pulp and Paper Co. will show in its 1923 report earnings of about $7 a share on its common stock and about $3,000,000 net working capital. The company in its present form was organized in 1916, prior to that it had been operated as a private company. The change was made in order that its large Canadian properties might be fully developed. It is today the largest Canadian company with a diversified production. Its mills are located at East Angus and Bromptonville, Que., and Groveton, Clarement and Bellows Falls, N. H. The ownership of American mills enables Brompton to convert Canadian-made chemical pulp into wrapping paper in the United States and thus avoid customs duty on the finished product.

Waste in Pulp and Paper Industry

Beaters and Beating

By B. T. McBain,

Assistant General Manager, Nekoosa-Edwards Paper Co.

LIKE the paper machine, the beater is almost in exactly the same position today that it was 25 years ago, except that it has been made larger in capacity, has had more power applied to it, but still is simply like an enlargement of a photograph, like the paper machine of today as compared with the days of our childhood.

However, there have been a few minor changes in method as well as in the kinds of bars and bed plates, yet none of them different to any great extent from those in use for the past quarter of a century.

True, there have been some new ideas advanced as to furnish and treatment, and some of the later patents cover so-called novel features, chiefly as to backfall shape and speed of travel.

Of late, now types of beater bars have been offered, each new one having some claims of advantage and, no doubt, have for certain results.

However, as Dr. Smith says in his recent book, very little is known about what really happens between the beater bars and bed plates; but a number of theories have been advanced any or all of which may be true in part.

Yet, it is known that by handling certain stocks in certain ways, certain results have been gotten. So it is that with certain types of bars and bed plates, other certain results have been shown.

It is also a fact that some types of bars and plates will produce quicker and better hydration than other types—some will draw the fiber out and others will cut it short.

There is a new beater on the market handling stocks up to 12% density, claiming quicker and better hydration, less floor space and lower power consumption per ton of finished product. Other beaters using greater power per unit and handling stocks up to 8% density claim that the power usage per ton considering the results guaranteed are of little moment, yet as compared with the old 3% to 4% consistency and the time required for hydration, they are not power hogs as some claim.

If beaters with greater density produce hydration so much quicker than in the older types, and the power per ton of finished product is less while the equipment takes up less floor space, it will only be a matter of time before many papermakers will adopt the new machine and method.

However, papermakers are skeptical and want to follow in the footsteps of their forefathers rather than take the initiative and try something new and the pioneer who goes into the market with a new idea, or "fool ideas" as so many such are termed, must be well fixed financially to carry over the pioneering period.

If there is anything new under the sun that will make hydrating of paper stocks an exact science, it is to be hoped that someone will soon prove it and stop the present guess methods and waste.

Crown-Williamette Wants Refund

In a demand for refunds on overcharges of limestone from limestone to it Camas plant, the Crown-Williamette Paper Co. on Friday, January 16, had a hearing for reparations from the Milwaukee, the Spokane, Portland and Seattle, and the Northern Pacific Railroads, through the state department of public works. The results have not been determined at this writing.

NEW FUELING PROCESS IS INSTALLED

Thilmany Pulp and Paper Company Makes Innovation in Its Mill

THE Thilmany Pulp and Paper Co., of Kaukauma, Wis., last week completed installation of a new process of fueling its furnaces which is expected to bring about large savings in fuel and in labor. The installation is in the company's new powerhouse, recently completed.

Coal is fed to the furnaces in a pulverized form, eliminating waste from ashes and clinkers. The fuel first is reduced to small chunks and then conveyed to a pulverizer which crushes the coal to dust. This dust is blown into the furnace as it is needed and is instantly converted into a gas which gives terrific heat without waste.

C. C. Hockley, now connected with the American Lakes Paper Co. at Waukegan, Ill., a subsidiary company of the Thilmany Company, designed the new firing system after long study. He was present when the new process was given its first trial.

Mr. Hockley believes danger of explosion of coal dust is eliminated because the dust is blown through a pipe from the pulverizer to the furnace and the pulverizer is only eight feet from the furnace door.

Considerable saving in labor also is expected to result from the new installation inasmuch as nearly all coal shoveling can be dispensed with.

* * *

Fire Cause Loss

Several thousand dollars loss was caused to the Dells Pulp and Paper Co., Eau Claire, Wis., when fire destroyed a part of the wooden false work used in constructing a new dam across the Chippewa river. Construction work on the dam is delayed at least two weeks.

Three forms into which concrete for the dam was to be poured were destroyed and the others were threatened. The blaze started from open fires that were built to keep the fresh concrete from freezing.

The fire was in the middle of the river and firemen were hampered because of difficulty of getting water to the blaze.

* * *

Last Year a Good One

William M. Loveland of Kalamazoo was re-elected president of the Watervliet Paper Company at the annual meeting in this city. All other officials of the organization were also returned for another year Reports were submitted showing the last year was the best in the history of the company with the exception of 1920. Among the many improvements installed during the year was a 2,200 horsepower uniflow engine to permit a maximum output.

* * *

New Firm Organized

The Reliance Paper Co. has been organized in Marinette, Wis., as a paper jobbing concern. The company will deal in paper bags, wrapping paper and paper specialties.

Harry E. Munson, late of the Victory Bag and Paper Co., where he was office manager and in charge of production, is head of the new company.

Tom Harvey Speaks Plan

Kalamazoo, Mich., Jan. 19.—No man can succeed unless he loves his work; and no man has a right to take charge of a crew of men until he has himself worn overhalls, mixed with the working people, and learned the trials and troubles they face daily. These statements were made by Tom Harvey, general manager of the Gardner-Harvey Paper Company of Middleton, Ohio, in an address before the Michigan Division of the American Pulp and Paper Mill Superintendents' Association. Mr. Harvey began paper making in Connecticut when he was thirteen years old and he has continued in the industry for more than half a century.

"I formerly invested the captain of industry in my imagination with almost supernatural abilities and powers. I have since learned that nearly all of them became captains of industry, not because of superior abilities, but because their heart and soul were wrapped up in their work.

"Eliminate the grouch. He is the greatest hindrance to the progress and development of your industry. Put spirit into the industry if you would better your production. A increase of between 15 and 50 per cent in efficiency is possible in that way.

"There is nothing today which prevents the foreman from knowing every man in his crew. You should sell yourself to your men. The foreman of the future will be the man who can prevent a large turnover in labor. To do that, he must stand by his men and give all of them a square deal. Don't be afraid to assume responsibilities and take the blame yourselves. I have known executives and managers who did more harm in five minutes than could be remedied by a foreman in as many months. The man in your must appeal to the man in your employes. You cannot mix enthusiasm and suspicion, good will and indifference."

* * *

Left Million and Half

The late John Strange president of the John Strange Paper Co., Menasha, New Appleton, Wis., valued at about $1,500,000, it is indicated in the will which soon will be admitted to probate. Mr. Strange died suddenly at New London, Wis., while delivering an address before a Rotary club.

An allowance has been granted his widow while the estate is being settled.

An elaborate wedding took place at Marinette last week when Miss Helen Delbridge became the bride of Agner B. Hansen of Racine. Miss Delbridge's father, J. H. Delbridge, is president and general manager of the Marinette and Menominee Paper Co.

Hawthorne Going Fine

A satisfactory year's business with bright prospects for the next twelve months were reported at the annual meeting of the Hawthorne Paper Company here during the week. All officers and directors of the company were re-elected as follows:

President, A. H. Dwight; vice president and secretary, R. L. Pease; treasurer, S. B. Monroe; and directors, J. H. Dewing, S. B. Monroe, Hubbard Kleinstuck, E. W. Chase, A. H. Dwight, and A. G. Wightman.

NEKOOSA STOCKHOLDERS AND DIRECTORS MEET

Alexander Again Heads Big Wisconsin Company

THE Annual Stockholders meeting of the Nekoosa Edwards Paper Company was held at Port Edwards, Wisconsin, on Wednesday, January 16th.

The various reports made and the Treasurer's statement showed the Company in best financial position possible.

The Sales Manager reported orders coming in good shape and that all eight machines were running on orders.

The stockholders elected the following to act as directors for the New Year: L. M. Alexander, Judson G. Rosebush, L. M. Hanks, George W. Kibby, L. E. Nash, J. B. Nash, J. E. Alexander, C. A. Jasperson and F. J. Wood.

Following the adjournment of the stockholders meeting a dinner was served at the Company Hotel at Port Edwards, after which the stock holders inspected the various mills of the Company, including the new Alexander Mill which was completed the past year, and which has become known as the first "wasteless" mill in America.

In the afternoon the directors met and elected the following officers: Mr. L. M. Alexander, President and General Manager; Mr. J. G. Rosebush, Vice-president; Mr. L. E. Nash, Vice-president and Manager of Sales; Mr. J. E. Alexander, Treasurer; Mr. and C. A. Jasperson, Secretary.

* * *

Logging Operations Advancing

Logging operations which have been behld up in Wisconsin and Minnesota by the absence of snow prior to the first of the year are now booming. While there had been a considerable amount of wood cut it could not be transported because of the lack of snow.

What was fall weather with the temperature ranging to about 50 degrees above zero until January 1, 1924, has turned into real winter with the thermometer registering to 35 degrees below zero. There is now plenty of snow for any operations as over three feet of snow have fallen since the first of the year, making excellent sleighing and conditions for working in the woods. 12 of the first 15 days of January have been below zero days.

Shipments are arriving rapidly at the different mills, some of them receiving whole trainloads of logs at a time.

* * *

Do Not Pollute Streams

Protests that Wisconsin Paper Mills are polluting streams with the discharge of matter causing death to game fish have been found to have no basis in fact. Elmer S. Hall, in a recent communication to the Izaac Walton league, reported that the state conservation commission, of which he is chairman, has investigated reports, and found that the discharge from paper and pulp mills has had no injurious effect on fish. He also reports that the mills of Wisconsin are voluntarily co-operating in preventing injurious chemicals from polluting streams, most of them having installed save-alls which reduce the danger from this source to a minimum.

It certainly is fine, when you're so cold you can't sleep, to have someone get up and find an extra blanket for you.—*Tree to Trade.*

Through the Far West

To Start Work Soon

Within the next thirty days the recently announced Portland Pulp and Paper Company will have commenced the actual construction of its new $1,200,000 plant, which will consist of ten modern concrete buildings, of a size to accommodate the new foreseen great future needs of such a firm. By a special method the Portland Paper Pulp and Paper Company will be able to eliminate the pitch from fir lumber. Minimum cost of production will be possible owing to the consumption of all waste material from the nearby Monarch sawmill. The new concern, which will be the only one manufacturing kraft paper west of Wisconsin, has been capitalized for $1,500,000. In securing Joe Kaster for its vice-president the Portland Pulp and Paper Company have availed themselves of the services of a man with twenty-five years experience in the paper manuufacturing industry of the Northwest.

* * *

Institute Safety First Campaign

More than 500 employees of the Crown-Willamette Paper company mills at West Linn attended a meeting which was held to stir up enthusiasm among the men and to gain their co-operation in an intensive safety compaign. Mr. Coffin who is in charge of safety work in Portland, Oregon, gave an address on accident preventatives and Mr. Boynton also talked along the same line.

The 1100 employees of the West Linn Paper mills are laboring to have a No Accident Month. In 1923 the mills had 166 accidents with a loss of 2267 days.

Portland, Oregon, has a Safety First automobile drivers organization. Those who have joined the organization display large Safety First cards on their cars. The organization which was launched under the auspices of one of the leading dailies of the city is rapidly becoming popular.

* * *

Largest Year's Timber Cut

The nation's lumber cut for 1923 is the largest amount for any one year since 1916 acording to the estimates of the National Lumber Manufacturers Association. The prices for lumber have been good and this will have an influence on the prices asked for pulpwood timber.

* * *

Underwent Many Changes

The Crown-Williamette Paper Company mill at Floriston, California, underwent many changes during the past year, and there will be considerable more re-construction work done this year. New blow pits were built; the sulphite mill was renovated and some work started which will be completed in 1924.

* * *

Won $25. Prize

Jack Davis, a machine tender in the Crown-Williamette Company paper mill at Camas, Washington, won a $25 prize offered by the Alfelco people for an article on how to get the most efficient service out of a wet felt.

Association Activities of the Month

One of the most important association developments of the month is the conclusion of arrangements by which the newly organized Boxboard Manufacturers Association will cooperate with the American Paper and Pulp Association in the compilation of monthly production statistics. Under this arrangements the Boxboard Association will provide the American Paper and Pulp Association with total figures of its membership, and the central association will only attempt to secure board figures from those not members of this group. This is the same procedure now being followed with other group organizations in the industry, says the monthly Bulletin of the American Paper and Pulp Association.

Owing to the retirement of Jacob Erichsen, secretary of the Gummed, Glazed and Fancy and Binders Board Associations to enter into private business, the central organization will carry the work of these groups for the balance of the fiscal year.

In view of the Japanese earthquake the Bureau of Foreign and Domestic Commerce prepared a special bulletin on the possibilities of the Japanese market for building and roofing papers and wall boards for the reconstruction work. The industry was notified by the Association of this publication, and the interest evidenced was manifested in requests for the publication from the manufacturers of papers of other grades than those discussed.

The Association has been actively following up the developments in the Mellon tax plan, in view of the almost unanimous endorsement of the plan by the Association's referendum. The Association has been cooperating with other interested groups, such as the Merchants Association of New York, the Chamber of Commerce of the State of New York and has informed congressmen and senators from paper making states of the attitude of the industry.

The Census Bureau is endeavoring to complete the census of the paper industry for 1923 at the earliest possible date, and has asked the Association to assist by encouraging early reports from its members.

The joint committee of the American Paper and Pulp Association, Technical Association and Association of woodpulp importers has completed its program for listing the requirements for approved chemists to weigh, sample and test pulp, providing conditions for listing these chemists, and the methods they will pursue.

Through the Information Service, arrangements have been extended for the supplying to mills or others of films showing the manufacture of paper, or safety and other welfare films. Investigations of abuses of the tariff laws in importation of foreign papers are continuing.

Plans have been completed for the meeting at Washington, Feb. 7 of the newly organized Advisory Committee for the Department of Agriculture.

The Association assisted in selection of paper traffic men to participate in the organization of the Shippers Advisory Board for the Middle Atlantic States for the American Railway Association. The conference took steps to eliminate differences between shippers and carriers particularly on car service matters.

Hartness Heads Engineers

James Hartness, former governor of Vermont, and past president of the American Society of Mechanical Engineers, was elected president of the American Engineering Council to succeed Dean Mortimer E. Cooley of the University of Michigan, at the annual meeting of the Council, which was held in Washington January 10 and 11. Addressing the Council, President Harkness declared that his administration would be characterized by effort aiming to aid, through the engineering profession, the American people in making the best use of the nation's energies and resources.

Vice-presidents elected were L. P. Alford of New York and Charles R. Gow of Boston. Other vice-presidents are Calvert Townley of New York and Gardner S. Williams of Ann Arbor, Mich. Dr. H. E. Howe of Washington was re-elected treasurer, and L. W. Wallace of Washington was again chosen executive secretary.

An outstanding feature of the Washington assembly was the national Public Works Conference held on January 9, and attended by representatives of sixty-three engineering and allied organizations. The Conference adopted resolutions favoring a reorganization of Federal departments.

* * *

Favors An Embargo

Hon. Arthur Meighen, leader of the Conservative party in Parliament, speaking in Quebec recently, came out strongly in favor of an embargo on exports of pulpwood. He said: "We should be making paper of it in this country, and not allow our product to be shipped across the way as it is. Our own people should be afforded employment by this great industry, instead of exporting our fine pulp wood in the raw." At Grand Mere Mr. Meighen paid a nice compliment to the work of Mr. George Chahoon, president of the Laurentide Company, for his efforts in respect to the pulp and paper industry generally.

* * *

Sir Edmund Walker Speaks

In his annual address as President of the Canadian Bank of Commerce Sir Edmund Walker said: "In connection with the vitally important matters of saving our forest industries and of making a satisfactory profit from the use of forest products, we are again discussing the relative advisability of manufacturing the product in Canada, or of allowing the product to leave the country as raw material, with the aid of which foreign countries can compete with us or even undersell us. When this question arose in Ontario over the export of saw logs from Ontario to Michigan, I took an active part in the discussion and in the measures adopted to prevent such use of our raw material. There can be no reasonable doubt that to sell pulp logs to a foreign country, when we are ourselves highly expert in the art of paper-making, is a national folly of which our neighbors would certainly not be guilty, if the case were reversed. We recognize that in Ontario the saw-logs were being cut from Crown Lands, and that this principle is already in force in Quebec so far as pulp wood is concerned. Whether it is right ot interfere with private ownership in order to accomplish what is so advisable in the public interest, is a matter for legislators to decide, but that we should protect our forests, our paper manufacturers and our country generally by such a restriction is surely clear, if it is fairly possible. As an eminent Canadian said recently, 'We must either manufacture the raw material of Canada within the country...... or the sons of Canada will follow these raw materials out of the country.'"

NEPCO EMPLOYEES MUTUAL ASSOCIATION ELECTS

Mutual Benefit Association Elects Officers for 1924 at Annual Meeting

MR. G. H. Suhs of Port Edwards was elected president of the Employees Mutual Benefit Association of the Nekoosa Edwards Paper Company of Port Edwards, Wiscounsin, at the annual meeting held on Thursday evening, January 17, at the Port Edwards Hotel. Other officers who will serve the association during the year 1924 are F. R. Goddard, vice-president; R. C. Peterson, secretary; and A. P. Mulroy, G. H. Suhs and F. H. Rosebush, executive committee.

Protects Employees

The Nepco Mutual Association was organized to provide protection to employees of the company and their families against sickness, accident or death. The plan of co-operative effort is one which has been generaly followed in American industry and there are now over 700 such associations in the country.

Membership of the Nepco association totals 868, which is 96% of the total number of men employed, and includes practically ever employee who is eligible to membership, these employees of all of the Company's mills at both Port Edwards and Nekoosa, as well as the Power Station as Wisconsin Rapids The receipts during the year of 1923 were $16,338, while $13,322 was paid out in benefits to members. The association now has a total of $11,305.20 cash on hand.

$12,874 For Accidents

The $13,322 which the association disbursed in benefits was not the only money received in that way by the Nekoosa-Edwards employees. The Employers Mutual Liability and Insurance Company of Wausau, Wisconsin, paid a total of $12,874.00 to Nekoosa-Edwards employees in 1923 under the provisions of the state workmen's compensation act under which all employees of industrial establishments are insured against accidents.

Purpose and Scope of Organization

The above mentioned association was started on March 1st 1921, and this is one of the most liberal associations.

Some of the features are as follows:

The dues are $1.00 per month or $12.00 per year.

$2.00 per day is paid for off duty accidents, sickness, etc.

Hospital allowance at rate of $2.50 per day.

$2.00 per day for on-duty accident not covered by Workmen's Compensation act.

$500 will be paid for off duty accident for irrecoverable loss of sight of eye or amputation of hand or foot.

$1000. is paid for off duty accident for total and irrecoverable loss of sight of both eyes; or the loss of both hands or both feet, or one hand and one foot.

Death in case of sickness or off duty accident $1000.

The object of the Association when it was formed was to provide its members with a definite income when sick and when disabled by accident, not covered by the Wisconsin Workmen's Compensation Act, and to pay their family a certain definite sum in case of death, at the least possible cost, considering the benefit.

Directors are chosen from the different departments in the mill and office there being a board of 12 directors.

Benefits paid from March 1, 1920, when the organization was started to January 1, 1924, are as follows:

896 Cases of Sickness	$28,942.00
86 Off Duty Accidents	1,789.80
208 Mill Accidents	2,174.00
10 Deaths	9,700.00
Medical Services	3,415.00
Hospital Allowance	2,814.25
Total Benefits Paid	$48,835.05

NORRIS APPOINTED RECEIVER

J. Victor Baron Leaves Position as President of Carthage Sulphite

THE appointment of Attorney Charles E. Norris of Carthage as receiver of the Carthage Sulphite Pulp & Paper Company last week meant the automatic vacation by J. Victor Baron of the office of president of the company. The other officers of the company also cease to function in their official capacities. They are: Lyman Rhoades, vice president, and Guy C. Jones, secretary and treasurer.

President Baron took over the management of the company about a year ago when difficulties developed. He is vice president and general manager of the Sherman Paper Company and one of the most astute and successful paper manufacturers in this section. He undertook the job of placing the Carthage concern on a paying footing, but shortage of Working capital thwarted his efforts with the receivership the inevitable climax.

There are those identified with the company who express the feeling that the mill will never be returned to the manufacture of paper and that ultimately its fine water power will find its way into the electric system of the Northern New York Utilities Inc., under the ownership of the Carlisle group.

The U. S. Gypsum Company is now admitted to have undertaken negotiations for the plant with a view to manufacturing its board supply there, but it is now claimed that this deal is all off.

Attorney Norris says that appraisers will be appointed by the court and these men would look over the property and obtain data on valuations.

Whether the mill would continue in operation while in receivership or whether the property would be sold is a matter to be decided later.

Asked regarding an Albany report that attorneys of unsecured creditors had asked for the appointment of a referee, he said that he knew nothing of this and that he was appointed receiver for all creditors and not for any special ones. He said that creditors having real preferred claims would of course receive prior payment.

The Albany report states that Attorney Francis E. Cullin of Watertown and Attorney W. B. Van Allen of Carthage represent unsecured creditors having claims of $219,000 out of $475,000 in unsecured claims.

The report further states that the business lost $150,000 the past year or about $12,500 a month. Sales for the five months up to December were cited as $387,000 but of this amount it is said that $64,000 was paid to the Finance and Guarantee Co., of Baltimore, to get immediate money on accounts receivable.

More Merger Reports

Montreal advices state that negotiations have been renewed for a merger of newsprint mills in St. Maurice valley on a larger scale. The companies included are Laurentide, St. Maurice, Belgo-Canadian and St. Lawrence Paper Mills. The latter is controlled by the same interests that control the Hollinger Gold Mines. Definite offers will be made in a few days for various properties. It is understood New York financial houses are working closely with the Canadians.

May Locate Paper Mill

Lately paper manufacturers have been looking over conditions in Albany, Linn county, Oregon, with a view to locating a plant at that place. It is stated that plenty of pulpwood timber can be obtained nearby, labor can be easily secured, and that market facilities are good. If a mill is located at Albany it will give two paper mills to the county. Lebanon mill is in Linn county and situated about fifteen miles east of Albany.

Erichsen with Atterbury & McKelvey

Jacob Erichsen, who for nearly two years has been serving as Secretary of several of the smaller associations in the paper industry, such as the Gummed, Glazed and Fancy and Binders Board Manufacturers Associations, has resigned to take effect January 15, when he goes with Atterbury & McKelvey, to engage in the sale of Scandinavian pulp. The various associations have decided not to name a successor at once, but have asked the American Paper and Pulp Association to handle the work for them until the general convention of the paper associations early in April. Mr. Erichsen has had offices with the American Paper and Pulp Association and has been successful in developing some valuable phases of cooperative activity on behalf of the groups which he has served.

Drake Process Explained

A late new invention, which required many years to accomplish and the expenditure of a vast amount of money, is now a reality and is known as the Drake Process, for producing all kinds of cartons, containers and milk bottles, of which the aggregate it is estimated One Hundred Millions are used daily in the United States; also dolls, toys, conduits, conveying pipe and hundreds of other articles, all of which are molded direct from the ground wood or waste paper pulp, into a seamless sanitary, one piece article at one operation automatically and in a few seconds time.

All of the containers made under the Drake Process are made with the use of SUPER-HEATED AIR OR STEAM at 600 DEGREES FAHRENHEIT, thus being enabled to sterilize all of the products to TWICE the amount OF HEAT used to sterilize doctors' instruments. This is the only known process where sterilization at such a degree of heat is possible in the manufacture of any dry container.

Among the articles made are: Liquid containers, semi-liquid containers, dry containers, shipping cases, baking powder cans, smoking tobacco cans, milk bottles, breakfast food cans, dolls and toys, kegs and barrels, talcum powder cans, show window forms, coffee cans, gold dust cans, salt and oat cans.

New Color on Market

The Dyestuffs Department of E. I. du Pont de Nemours & Company, in response to a demand from the paper and cotton trades for a very green shade of direct yellow, has just placed on the market a new yellow, known as Pontamine Yellow SXG, which produces dyeings greener and brighter than Pontamine Yellow SX, but possessing the same good properties.

Paper and Board

New York, January 22—Demand for paper of most kinds is not developing in a way that many members of the trade would like to see it. Consumers are proceeding very carefully in their buying; few are placing orders for other than supplies which are actually and immediately needed, and yet the market is characterized by fair activity for just this point in the year. One of the principal complaints of manufacturers and jobbers is the small volume of orders. This of course reflects the fact that buyers are operating on a hand-to-mouth scale, and is not likely to improve until consumption increases and users have need for larger amounts of paper.

Moreover demand is very spotty. In some parts of the trade reports are received to the effect that business is quite satisfactory, in others just the opposite is reported. Obviously this means some consumers are buying in relatively larger volume than others; also that certain kinds of paper are in much better call than others. Mills as a general rule are securing enough business to warrant productive operations on a fair scale. Few are running at capacity; on the other hand, few have been obliged to close down. It was reported during the week that the International Paper Company shut down one of its plants at Franklin, N. H., orders having gone out from the New York offices of that company, and poor business being given as the cause. Were this some other paper manufacturing concern, this development would doubtless bear greater significance; for example, if some company having one or two or even three mills was compelled to close one of its plants it would signify that paper demand was anything but satisfactory, but a company such as the I. P. with its numerous mills can discontinue operations at a single mill without meaning a great deal

Newsprint is in a firm market position, and no let up in the movement of print paper toward consumption is reported. Quotations are marked by a strong tone, with transient buyers frequently finding it necessary to grant slight increases to cover their requirements owing to the fact that most newsprint manufacturers are sold up on contracts.

Production of all classes of paper from the mills of the International Paper Company aggregated 540,000 tons in 1923, according to preliminary figures made public by that company. This compares with about 433,800 tons produced in 1922, showing a very healthy increase. The output last year, according to President Philip T. Dodge, was made up of one-third high grade paper and the balance newsprint.

Inquiries for fine paper in the hands of manufacturers and jobbers are developing into orders, and the movement of bonds and ledgers is gradually increasing. Prices are holding firm on high grade papers and this is a factor which is helping to bring buyers into the market. The cost of rags and other raw materials is steadily mounting, and manufacturers contend there is small probability of prices receding on any of the lines of fine

Durability and Elegance

To compel attention and stand out from the masses your direct-mail matter should carry an air of distinction. The selection of the proper paper is a mighty important factor in obtaining this result.

FRANKFOLD Enamel

helps give your message the first call and preference over others because FRANKFOLD ENAMEL is made purposely to withstand vigorous use without showing the unsightly cracks so common among most Enamel papers.

The uniform, smoothly coated surface of FRANKFOLD ENAMEL helps your printer to obtain unusual results, either in black or multi-color.

We will gladly forward some printed specimens or blank sheets for dummy purposes.

PAPER
1478 Broadway
New York

paper unless there should be an unforseen reaction in the raw material market.

Book paper is in good movement but there is much room for improvement in this branch of the trade. Contract buyers of book paper are absorbing supplies in a steady manner and in moderate tonnage but demand from other consumers is slow. Prices are somewhat soft and producers are now and then shading quotations in an effort to stimulate demand.

Tissues are quotably steady and in routine call. Wrapping papers also are moving in routine amounts but mills are looking for additional orders and are granting some price concessions.

Box boards are easy in price and in limited demand. Plain chip is quoted at $45 a ton f.o.b. New York and news board at $50 per ton, and the probabilities are purchases are being made at cheaper prices. It is evident mills are competing for business and that they are shading prices.

Mechanical Pulp

A little easing of quotations on mechanical pulp has been noted, due, it is stated, to available supplies in the market being somewhat larger than they were, reflecting the increased operations of grinders occasioned by favorable weather conditions. Producers in Canada are reported selling ground wood to United States consumers down to $35 a ton f.o.b pulp mills, while importers of ground wood from Scandinavia are said to have disposed of some pulp on the spot at New York or other American Atlantic ports at as low as $31 a ton ex dock. Domestic grinders are quoting around $38 a ton at producing plants, quotations of course depending on the air dry test and the freight to consuming points. The open weather thus far this winter has enabled grinders to keep producing at a good rate, it is stated, and this has resulted in the accumulation of some surplus stocks of ground wood, which probably explains more than any other reason the sagging of prices.

Foreign and Domestic Chemical Pulp

Business in chemical wood pulp continues to develop slowly and yet the market is unmistakably showing some improvement, and it is well apparent that paper manufacturers are exhibiting more interest in offerings. Not a great deal of support is being given the market by important buyers, and although the situation is such where it appears everything is set for an advance in values, and sellers are more confident in their views and are offering less pulp, prices are afforded little opportunity to rise because of the limited demand. In some quarters quotations have been raised slightly. Foreign unbleached strong sulphite is quoted at between 2.65 and 2.75 cents a pound ex dock New York, against a recent bottom price of 2.50 cents, while Scandinavian kraft pulp is quoted at around 2.60 cents on the dock, whereas a short while ago purchases were made at below 2.50 cents. Domestic pulps show a hardening price tendency also. Producers claim there is no profit in manufacturing at present market values and are endeavoring to get prices up to where they can operate their mills at other than a loss. It is generally felt that as the winter progresses demand for pulp will expand, and with the increase in the movement into consuming channels it is believed values will be enhanced. Quotations ex dock New York and f.o.b. pulp mills are:

Domestic Rags

Probably the firmest kind of papermaking material at present is rag stock. Practically all grades or rags are in demand and prices are steadily moving higher, the low qualities used by roofing paper mills leading and nearly all the other grades sharing in the advance. Sales of No. 1 roofing rags have been made at 2 cents a pound and higher f.o.b. New York, while No. 2 packing has sold at 1.80 and 1.85 cents f.o.b. this city. Moreover, mills have bought freely at these prices and indications are dealers are well sold up for some time. Old thirds and blues have risen sharply. Repacked rags of this class have brought 3.50 cents a pound at shipping points though, according to quality of packing, they also are available at less than this figure. Old whites are firm and are gradually moving upward in value. New cuttings are in good demand and quotably firm with a particularly active inquiry for No. 1 white shirt cuttings at around 13.50 cents a pound New York, blue overall cuttings at 9 cents, and unbleached muslins at 11.75 cents. Quotations f.o.b. New York follows:

New Shirt Cuttings, No. 1	13.50	@	14.00
No. 2	6.00	@	6.25
Fancy Shirt Cuttings	6.25	@	6.50

Roofing Rags, No. 1	2.00	@	2.10
Roofing Rags, No. 2	1.80	@	1.85

Imported Rags

Imported papermaking rags also are in active demand and advancing in price. Importers claim to be obliged to meet higher rates abroad and are repeatedly marking up quotations to mills, despite which a steady buying movement is noted. Dark colored cottons are bringing 1.80 to 1.90 cents a pound ex dock New York, while sales of German blue cottons have been reported at 3.25 cents a pound on the dock. Linens are firm and under inquiry, and new rags are moving in a consistent manner. Ex dock New York prices are as follows:

Lins., White, No. 1	12.00	@	13.00
Ger. Blue Cottons	3.25	@	3.50
French Light Blues	3.50	@	3.75

German Light Prints	4.00	@	4.25
Dk. Colored Cottons	1.80	@	1.90

Bagging, Rape, Etc.

Old rope prices are well maintained with dealers reporting sales of No. 1 domestic manila rope at 6.50 to 6.75 cents a pound f.o.b. shipping points and of No. 1 foreign rope at 6.25 cents ex dock New York. The feature in old bagging is the broader demand for gunny and for roofing bagging. No. 1 gunny is fetching 1.50 cents a pound at dealers' shipping points for domestic and close to this figure on the dock for foreign stock, while roofing paper mills are paying one cent a pound and higher for roofing bagging at shipping points. F.o.b. New York quotations follow:

Gunny, No. 1	1.50	@	1.60
Foreign	1.40	@	1.50

For. Manila Rope	6.00	@	6.25
Domestic Rope	6.50	@	6.75
Mixed Strings	1.00	@	1.25

Old Paper

After having displayed a stiffening tendency for a while, prices of old paper have again turned easy and some grades are slightly lower in value. This is especially true as regards the cheaper qualities. Dealers appear to be holding the high grades but are letting go of the low qualities for whatever they can secure in the way of price. Folded newspapers are selling at 85 cents a hundred pounds f.o.b. New York, and possibly at a shade less, while No. 1 mixed paper is available at 65 cents New York. Shavings are little wanted, and offerings of shippers have been noted at 3.85 cents a pound and less f.ob. New York of No. 1 hard white and at 3 cents New York No. 1 soft white shavings. Flat magazines are selling at between 1.50 and 1.75 cents a pound at shipping points, and No. 1 crumpled magazines at 1.25 to 1.35 cents. Old kraft paper is steady at about 2.15 cents a pound New York. Quotations f.o.b. this city follow:

No. 1 Hard White Shavings	3.75	@	4.00
No. 2 Hard White Shavings	3.25	@	3.50
No. 1 Soft White Shavings	3.00	@	3.25

Manufacture of Pulp and Paper

IN FIVE VOLUMES

Being prepared by the Joint Committee on
Vocational Education of the Pulp and Paper Industry
Volumes I, II, III and IV now issued.

Volume V is expected during the year.

The work is adapted to the classroom, to home study and for use as a reference work. Every firm and individual connected with the industry or interested in the pulp and paper business should own one of these sets.

The volumes issued are on sale at $5 a volume and orders may be placed with the Technical Association of the Pulp and Paper Industry, 18 East Forty-first Street, New York or with Hughes Publishing Co., Inc., Suite 418, 1478 Broadway, New York.

TO ADVERTISERS

It is quality that counts, not quantity. This is true of circulation as well as of other things.

JONES BROTHERS CO.

BARRE, VT. **BOSTON, MASS.**

Twines

Current demand for twines is mostly of routine character yet it is said the market is showing fair activity for this time of the year. The price tone is very firm, due more to the strength in raw materials than to any unusual movement of the finished product into consuming channels. No. 1 manila rope is quoted at 15.25 cents a pound, jute rope at 15 cents, and papermakers' twine at 11.50 cents. Quotations are:

Sisal Hay, pure	12.25	@ 13.25		Jute Wrapping twine, A grade	20.00	@
Manila Hay, pure	16.25	@ 17.25		Papermakers Twine	11.50	@

Eight U. S. Companies Bid

With eight United States companies bidding for pulpwood in the Thunder Bay district, and the total value of the export pulp estimated at 1,000,000, pulpwood operators and pulp "farmers" stand opposed to any legislative measures that would exclude the United States interests or make it prohibitive for them to buy on this side of the international border. This was the decision made by witnesses before the Royal Commission on pulpwood which sat at Port Arthur. One of the main arguments advanced by the farmer-operators was that the placing of an embargo on pulpwood to the United States would place the producers at the mercy of the home concern who would then be able to dictate the price of wood, without interference from outside competitors. Practically the entire district of Thunder Bay is opposed to the placing of an embargo or tax upon Canadian pulpwood going to the United States. Mill operators appeared the only interests supporting the idea.

* * *

Backus To Push Power Project

The Lake of the Woods control has practically effected an arrangement with R. W. Backus, Fort Frances, Ont., and Minneapolis millionaire lumber and pulp operator by which he will be enabled to proceed with his proposed power development at the Norman Dam at the outlet of the Lake of the Woods. Control of the Lake of the Woods levels will be secured to the board by the arrangement. What remains to be settled is the share of the cost of reconstruction work at the Norman Dam, which the Government should bear.

Sherwood Stockholders Meet

The annual meeting of stockholders and directors of the Sherman Paper Company of Watertown, N. Y., was held in the local offices last week. No change was made in the organization of the company and no special business of public interest was reported.

Mrs. Alice T. Sherman was reelected president; J. Victor Baron was continued as vice president and general manager, and O. P. Barnes was reelected secretary and treasurer.

The stockholders elected the following directors: A. T. Sherman, J. V. Baron, O. P. Barnes, George Olmsted, of Chicago, and Delos M. Cosgrove.

Manufacture of Pulp and Paper

Volume IV Now Ready

Prepared by the Joint Committee on Vocational Education of the Pulp and Paper Industry

Although it was promised as a Christmas present we have this much desired book for a New Year's gift. The fact that the date of publication on the title page is 1924 goes to show that the editor was promising more than he could perform. However, we have the book and will make a good start for the new year by reading it. Perhaps its advent will stimulate many of those who have the third volume in their bookcases to read it as well.

It is a book of 527 pages divided into six sections as follows:

Section 1. Preparation of Rags and Other Fibers, 62 pages, 19 illustrations, by E. C. Tucker.
Section 2. Treatment of Waste Papers, 72 pages, 21 illustrations, by E. T. A. Coughlin.
Section 3. Beating and Refining, 80 pages, 32 illustrations, by A. B. Green, with a Bibliography of 6 pages by C. J. West.
Section 4. Loading and Engine Sizing, 49 pages, 14 illustrations. Loading by Ross Campbell and Engine Sizing by J. A. DeCew.
Section 5. Coloring, 54 pages, 4 illustrations, by the Dyestuffs Committee of TAPPI in collaboration with Otto Kress.
Section 6. Papermaking machines, 210 pages, 83 illustrations, by J. W. Brassington.

In addition to the authors the editor and the committee in charge of the preparation of the work credit a long list of companies and individuals for helpful service and advice.

All that was said of the third volume covering the Preparation and Treatment of Wood Pulp may be repeated. Its successful accomplishment is unique as it represents the co-operative effort of the paper industry of a whole continent. Never have such care and expense been devoted to the preparation of an industrial work of instruction and reference.

Each section after being written, was examined and criticized while in manuscript by several competent authorities. The book is in fact the work of more than one hundred men prominent in the industry.

When the final volume of the set, now well advanced, is completed it would be difficult to exaggerate the importance of the achievement to extend too much praise to the editor-in-chief, J. N. Stephenson.

The four volumes issued are on sale at $5 a volume and orders may be placed through

Hughes Publishing Co., Inc.

ORR FELTS and JACKETS

Lowest Cost per Ton

If you judge felt values, not by what you put into the equipment, but what you get out of it—then you will specify ORR 3 stripe Endless Felts for ORR felts will produce the lowest cost per ton. They "stand up" under severe usage. Orr durability is acknowledged everywhere. Their strength and long life are as dependable as their reliability and quality.

In the 32 grades of Felts and Jackets we can match your most exacting demands. Tell us the kind of paper you desire to make, and we will send you samples of felts that will economically serve you and help you to produce paper at lowest cost per ton.

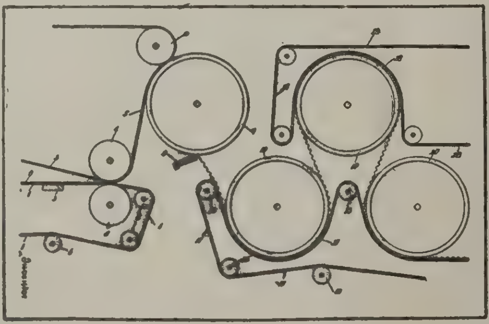
Improved Process of Creping Paper

The Best and Most Profitable

For the manufacture of CREPED PAPER Napkins, Toweling or Stretchable Bag Papers and Creped Packing or Crepe Wrapping Papers the system has no equal



The crepe being formed while the fibres are steaming hot and pliable is dried without stretching; not only retaining form better, but shedding less lint than cold creped paper products.

The Magazine of the Paper Industry

RUSSELL C. HUGHES, Publisher

THOMAS J. KEENAN, F.C.S., Technical Editor

ISMAR GINSBERG, B.S., Contributing Editor

Our Canadian Convention Number

SO important and far-reaching was the annual convention of the Canadian Paper and Pulp Association in Montreal last week, that PAPER is dedicating itself this week entirely to that convention. Outside of the usual news features, the entire book is devoted solely to the good things brought forth at the convention.

* * *

The technical, semi-technical and inspirational addresses at the convention had more than the ordinary interest. The reports, of which that of Secretary Frank B. Kellogg, of the Newsprint Service Bureau, is a sample, all contained real red meat for the men in the paper industry. Hence we felt that we couldn't do better than just to give one issue over to this cause. The addresses and information given at the convention should go to the furtherest ends of the paper trade. We are doing our share. Now do yours by absorbing this issue from beginning to end.

* * *

Our joy continues unabated that we have gotten among such a fine bunch of fellows as are in the paper industry. Times have been better in the paper business. That statement needs no embellishment. But when a failure comes along—although there are regrets and commiseration—there is no mournful lamentation in the industry in general. Despite a series of failures that would have dismayed many an industry, the general talk and atmosphere among the fellows of the paper industry is optimistic, cheerful, hopeful. This, we call assimilating punishment like a stoic. Not that failures are not deplored. Far from it. But the spirit seems to be, "It's too bad. But it can't be helped. We might as well be up and doing. Let's go."

That is another reason we are glad to be in the paper industry.

* * *

And as far as PAPER itself is concerned, we are highly gratified at the response to the revitalization and rejuvenation of the magazine. From all over the land comes praise, brief messages that what is being done is being appreciated.

Whoever said people do not appreciate good things is a victim of false reasoning. They most emphatically do recognize extra effort and appreciate service.

* * *

Furthermore we are glad to have Tom Keenan with us. Just this week there came this letter:

Mr. Russell C. Hughes,
New York City.

Dear Sir:

I wish to congratulate you in having gathered Mr. Tom Keenan back into your fold.

I not only envy his technical knowledge of the business but I think he is by far the best editorial writer in the paper business.

Yours very truly,

Bertrand Hopper.
Kalamazoo, Mich.

And that scarcely requires expatiation.

Likewise D. E. Scott, of the Bemis Bros. Bag Company, Peoria, Ill., writes that it is a pleasant surprise to see Mr. Keenan on the job and extending best wishes for every success.

And so it goes. Everywhere good words and kindness.

It makes one want to do better. It bucks one up and renews faith. We thank you.

But we want your suggestions. We want your advice. We want you to have a personal interest in this magazine. We want to mold it to the collective will of the entire industry. So speak your mind. We want to know what you think.

Russell C. Hughes, *Publisher.*

Published weekly by Hughes Publishing Company, Inc., at East Stroudsburg, Pa., George C. Hughes, President. Executive and Editorial Offices, Longacre Building, 1478 Broadway, New York City. Address all communications to Executive Offices.

Canadian Convention Filled with Interest

Sir William Price, G. Chahoon, Jr., George H. Mead, H. F. E. Kent and George Carruthers Among Speakers

PULP and paper being one of Canada's leading industries, the annual meeting of the Canadian Pulp and Paper Association, held in Montreal last week, was one very great interest, not only to the industry generally, but also to the general public. This was because of the outstanding nature of some of the speakers, and the subjects on which they discoursed. When industrial captains, such as Sir William Price, G. C. Chahoon, Jr., Geo. H. Mead, H. F. E. Kent, Geo. Carruthers, and many others who could be mentioned, express themselves on matters relating to one of the leading industries of North America they have something worth listening to, and so it proved. The papers delivered before the Technical Section were especially good; while Hon. T. A. Low, Minister of Trade and Commerce spoke on the past and present of the pulp and paper industry in such a way that he indeed must have been a pessimist who was not impressed.

The appearance of the pulp and paper men in such large numbers was taken advantage of by allied interests to stage other gatherings, the most important of which was the annual meeting of the Canadian Forestry Association. At these sessions notable addresses were delivered by F. D. J. Barnjum and Sir Lomer Gouin, until recently Minister of Justice in Canada and who as premier of Quebec introduced the policy of compelling those cutting pulpwood on Crown lands to manufacture it at home. He strongly defended this policy and favored the proposal to place an embargo exports of wood cut on privately owned lands.

Might Pass U. S.

In speaking at the annual banquet of the Pulp and Paper Association Hon. T. A. Low ventured the prediction that during the present year Canada might pass the United States in the production of newsprint.

Mr. Low pointed out that newsprint formed 80 per cent of Canada's total paper production, and that the market for four-fifths of it was found in the United States. He also remarked that two-thirds of the newsprint used in the republic is either manufactured in Canada, or made form pulpwood grown there. The total production of newsprint in Canada last year was 1,263,000 tons, a high water mark in the industry, representing an increase of 181,000 tons over the 1923 production, or equal to 16 per cent. As late as 1920 the production was only 883,000 tons during the course of the year. The total exports in 1923 were 1,137,963 tons, as compared with 959,515 for 1922. Of this all but 22,627 tons went to the United States, New Zealand alone taking nearly 10,000 tons of the remainder.

Hardly any other industry in America has grown as fast as that producing pulp and paper, except possibly it was the automobile industry. In 1878 there were no pulp mills in Canada; by 1881 there were five, with a capital investment of $92,000, with 68 employees and an annual output worth $63,000. In 1922 there were 43 mills turning out pulp alone, and 23 turning out pulp and paper combined, which was valued at approximately $85,000,000. In addition there were 28 paper mills, the total capital in the combined industry being $381,000,000 and being increased very rapidly. Mr. Low reviewed the history of the legislation by the provinces against the exportation of pulpwood cut on Crown lands and defended it, pointing out that as a result the quantity annually exported had not, until last year, much exceeded that in 1922. As for the future supply of wood, he expressed the conviction that the success of forest conservation would depend pretty much on common action on the part of Canada and the United States.

The Technical Men

Among the noteworthy addresses delivered before the Technical Section special mention is deserving that by Geo. Chahoon, Jr., on "The Place of the Technical Man in the Paper Industry", for it contained much that is equally applicable to young men in all walks of life. His message in short, was this; learn all you can about the technical side of papermaking get all that books and investigation can give you; but don't forget that life has a human side, and that the ability to organize and handle man is as important as anything else. Moreover, it can't be learned from books. One of his telling sentences was; "How you succeed in business or in life will never be taught in college or in school."

This address subsequently attracted much attention and was the subject of considerable discussion. Sir William Price was inclned to rate the technical men very highly remarking; "Technical men with common sense and vision are going to be the men of the future". To his way of thinking, purely practical men were handicapped through their lack of education. There should be close cooperation between the two classes. Geo. H. Mead threw out the suggestion that the technical men should outline a course of training that might be pursued by a technical man during the first four or five of his years in the industry.

Spoke to Forestry Men

The remarks of Sir Lomer Gouin before the Candaian Forestry Association were of special interest as he spoke on the embargo question. After narrating the history of this legislation in Quebec he discussed the larger question of federal action and said; "Is it possible to make that prohibition general in Canada? The objections come from the settlers and the jobbers. As to the jobbers, I have nothing to say, because I know that they will take good care of their own interests. As to the settlers, I am very favorably disposed to them, and I know that they have to be protected. But we made it possible in this province of Quebec to impose a prohibition of the export pulpwood on Crown lands and we find that our settlers are just as happy and prosperous as in any of the other provinces. I do not see why some way might not be devised by which prices would be fixed which would make it that the settlers in the entire country would receive from our own manufacturers as large a price as they could receive from the Americans. Would it not be possible for our governments to legislate to fix prices by a commission, if you like, so that the settlers will be treated as when exportation is allowed?"

Hon. James Lyons, Ontario's minister of Mines and Forests, told the pulp and paper men that his province was spending $1,100,000 a year on forest fire protection and was not getting anything like full value for it. This amount represented one-third of the total annual revenue derived from the forests. He strongly requested the heartiest co-operation on the part of the industry in the effort to preserve forest wealth. A survey to determine the amount of forest material in Ontario would soon be undertaken.

George Carruthers of Interlake Tissue Mills, Toronto, was elected president of the Association thus taking the place of H. F. E. Kent, retired.

At the annual meeting of the Newsprint Service Bureau, Secretary R. S. Kellogg made an excellent report of the newsprint situation in Canada and the United States. All officers of the Bureau were re-elected.

Felts and Mechanism of Water Removal

Result of Research Work Carried on by Laboratory of F. C. Huyck & Sons as Reported to Canadian Convention

By E. A. REES

IN the papers presented last year before this group, the results of certain studies in the laboratory were presented and it was attempted to collect and present, in a more or less graphic manner, the fundamental laws underlying the removal of water from paper at the presses. The laboratory evidences indicated that the entire mechanism from the standpoint of pressing and filtration. It has always been more or less the popular conception that the water is sucked or absorbed from the sheet by the felt much as a sponge would absorb water. Laboratory and field evidences to date indicate that the primary factors are not ones of capillarity and absorption in the literal sense and that the whole question may be met from the standpoint of a pressure-filtration equilibrium. The fibers must of course possess an ease of wetting properly to enable the water to filter away easily. In the initial period of the starting-up of a new felt, there is always a very thin film of animal fat covering the fibers and due to surface tension affects the water runs through the felt with difficulty. However, in general, aside from this isolated period, the felts possess a more or less constant ease of wetting capacity so that this factor practically is eliminated from consideration. It is largely a question of an equilibrium of pressure conditions, squeezing the water out of the felt, and with the felt acting mainly as the cushion and medium for the filtration of the water. *The resulting dryness of sheet is determined by this equilibrium between the forces tending to eject the water from the mass of cellulose and the forces interfering with its release and escape from the zone of pressure.*

Words of Wisdom

IF anybody in the world knows felts it is F. C. Huyck & Sons, of Kenwood Mills, Albany, N. Y., and Kenwood Mills Ltd., of Arnprior, Ontario, Canada. Consequently the conclusions of research work of this concern are of the utmost importance to the entire papermaking trade. This paper, couched in terms that anybody can understand, is a valuable contribution to papermaking.

Factors and Laws of Water-Removal

The general direction of the effects of these different factors as derived from experimental work on miniature machines designed for the use of small felts, 14' x 18", were presented before this group last year. The tests were made by saturating small strips of blotting paper and running them through the rolls on felts. The different factors were varied as desired and it is believed that for comparative purposes the results obtained were just as indicative of the general direction of the relative effects as if a continuous sheet of pulp or wet paper were running on the felt and between the rolls.

The summarized factors and principles which determine the water-removal status are—

1. The Pressure Applied.
2. Hardness of Rolls.
3. Diameter of Rolls.
4. Speed of Sheet and Felt.
5. Resistance of Felt to the Flow of Water.

The total pressure applied, the hardness of the rolls and the diameter of the rolls all affect the concentration of pressure over an area of sheet at the nip zone. Now the sheet enters the nip upon a felt and the felt itself may materially affect the concentration of pressure just as a bottom press roll may affect it. In fact the cushion or relative hardness or softness of the felt influences the concentration of pressure at the nip zone so greatly that the factors of sheet crushing on a practical and safe operating scale are very intimately connected with the type of felt demanded. There is also a differential of pressure distribution change over the nip area, the pressure spreading from a high concentration at the very nip to smaller and smaller pressures through the zone of contact and these changes may be abrupt or gradual. (Relative pictures of these areas were obtained by ink impressions from the top roll when resting on a sheet of paper lying upon a stationary felt.) This whole question then must be referred to the concentration of pressures per unit area of nip contact and also the area over which the pressure is spread. Now there is the speed of the sheet and felt, which determines the force with which the water moves forward due to its own velocity and the time of contact at the nip and finally the resistance of the felt itself to the flow of water—all of these factors together with the pressure-area forces finally determine the resulting equilibrium content of the sheet.

Mechanism of Water-Removal Through Felt

It is quite interesting to note that as the sheet and felt approach closer and closer to the nip where the rolls are in the closest contact, there is more and more resistance to the flow of water because of the impervious roll beneath. And there is also the tendency for the revolving roll to carry the water back into the nip. As the water is released farther back in the nip then, there is more and more necessity for water to permeate through the felt in the direction contrary to its motion. This lateral or backward porosity seems to be the real mechanism by which the water flows through the felt at the nip. (See Fig. 1).

As far as the felt is concerned, its cushion and hardness or the extent to which it itself affects the nip pressure and its ease of admitting the flow of water through it are the balancing factors which are of primary importance.

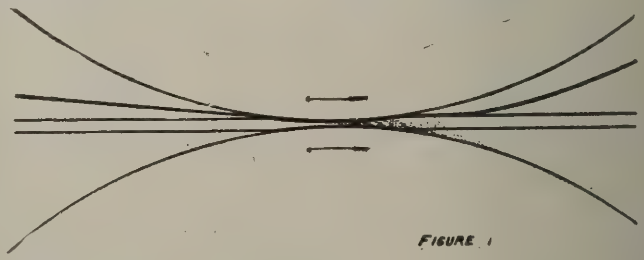

FIGURE 1

There is more or less a popular conception that a felt is a "felt," made of wool but of definite and constant properties which are more or less similar to those of an ordinary felt. Now there are an infinite number of possibilities for producing different properties in a woolen felt—there are all sorts of combinations of wools and yarns, etc., which can be built into different resulting balances of characteristics with different water-removal abilities.

Lack of Constancy of Felt and Effect of Stock

Now it so happens that it is an inherent property of wool and the felts that its performance is not a constant one.

There is a gradual change in the chemical constitution of the fiber and due to the deteriorating action of the water it gradually loses its resilience and life and tends to become brittle. Due also to the continued application of pressure between the rolls, the felt is gradually packed down harder and tighter and flatter so that it gradually creates more and more nip pressure and of itself tends to squeeze more and more water out of the sheet of paper. But it has also been found that as these changes occur, its lateral porosity decreases and its ability to permit of the flow of water through itself grows less and less. And the resultant dryness of sheet depends upon how the two factors of increased tendency to squeeze out more water and also increased resistance to prevent its flow neutralize each other in the felt.

It has been proved on the laboratory testing machine by taking periodical tests day after day with small saturated strips of blotting paper that a dryer and dryer sheet was obtained. In other words, the factor of increased nip pressure, due to the hardness of the felt, overbalanced the loss in ability of the felt to admit of the flow of the water with the net result of a dryer sheet. And this has been proved repeatedly with all sorts of felt constructions. Different initial dryness was obtained with different felts and the change toward dryer sheets occurred at different rates, according to the particular balances employed, but in all cases there was the general tendency toward dryer sheets of blotting paper as the felts were run day after day. It so happened because of the manner in which the laboratory tests were performed that there was no tendency for any plugging-up of the felt by means of cellulose stock and it was run continuously, essentially as a system of wool fibers alone. Now of course this is not true in a practical working mill condition and even with the best washing facilities and frequent cleansing the felt gradually becomes more and more dirty and departs more and more from its initially clean condition.

Fig. 2 shows a representative performance of a typical first press news felt. The fluctuations are due principally to periodical washings. The gradual trend downward in water removing efficiency is the significant point. This loss in efficiency is characteristic of all felts on all the presses as they continue running. It seems quite evident that the difference in change of efficiency in a practical working condition on the one hand and the laboratory on the other hand must be attributed to the action of the paper stock in dirtying the felt. This has a very important bearing on the entire water-removal problem.

It would indicate that satisfactory felt cleaning devices are very much in need and also that for every felt there is a balancing point at some stage in its life where its lack of water-removal ability would not warrant further running.

Suction Press Performance

Now it has also been found on a fast running machine that it is possible to shut off the suction entirely and not affect the water-removal ability of the suction press. The water which is removed at the nip is never drawn through the pump at high speed even with the suction on but is always caught in the save-all under the press where it has been thrown out of the holes by centrifugal force. On a slow speed machine it has been found that all of the water is sucked through the pump and none of it is thrown out into the save-all by centrifugal force. Calculations reveal that at 1,000 ft. per minute the time of contact at the nip is only about 1/70 of a second.

This is all suggestive as to whether or not the real mechanism of water-removal at the nip on high speed suction press conditions is not one of squeezing and merely pressing into the holes and that the provision of channels or holes to enable the water to get away easily at the nip may be a principle of some merit.

It has been shown how the water-removal efficiency decreases day by day on the ordinary press. The felt becomes flatter and harder and creates more nip pressure but it also tends to pick up stock more easily and become plugged. The stock particles block the passage for the flow of water so that the net result is less and less water-removal efficiency.

Fig. 3 shows a representative performance of a felt running on a suction press. The felt here also becomes flatter and harder and creates more nip pressure and with the added ease provided possibly by the holes at the nip for enabling the water to get away, the net result is an increase in felt efficiency day by day.

It would seem that this entire mechanism of water-removal at the nip is well deserving of further concentrated study.

Field Application of Water-Removal Felts

During the past year in co-operation with two of the largest and most representative News mills of Canada, it was attempted to build felts for different conditions and embodying many different balances in properties. The object was to ascertain whether the balance could be thrown in the direction of more water-removal at the presses in a practical working condition. The first step consisted of measurement of the physical factors in the conditions.

Top press rolls were weighed and leverage pressures measured by means of dynamometer attachments. Variations of pressure which occur in practical working conditions could also be followed by means of the dynamometers. Fig. 4 shows a dynamometer installation in the leverage system of a press. Dynamometers were also attached to the hitch rolls and the felt tensions followed throughout the running life of felts.

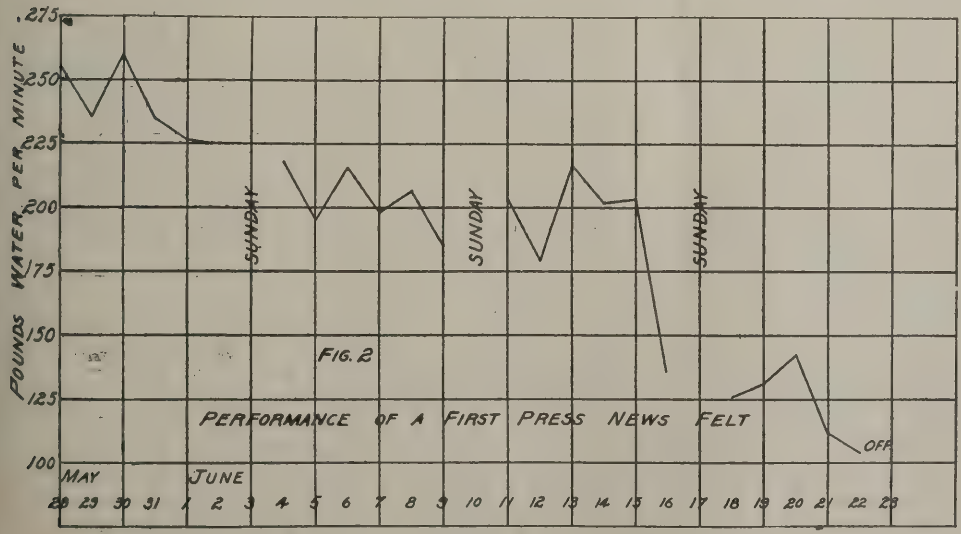

FIG. 2

PERFORMANCE OF A FIRST PRESS NEWS FELT

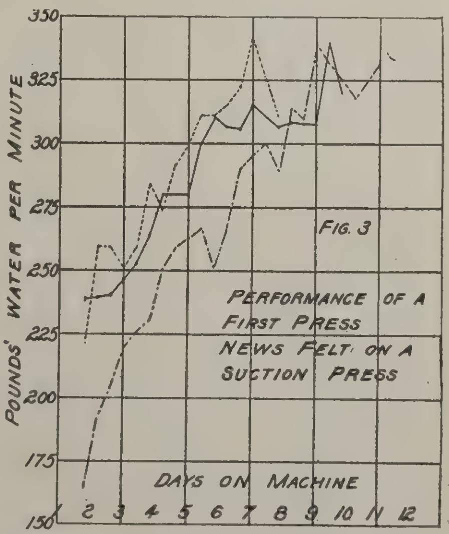

FIG. 3

PERFORMANCE OF A FIRST PRESS NEWS FELT ON A SUCTION PRESS

The work performed by the felts was then followed by periodically weighing the water which was squeezed out at each press. The usual moisture test was taken as often as practical but this test generally is accompanied with a great many difficulties and large errors in manipulation and is only representative of a very small period of time and in fact very little emphasis could be placed upon it without the accumulation of a considerable number of tests. Felts were balanced in many different ways and followed closely—in fact the complete performance and history of all the presses was collected and correlated carefully with the steam readings.

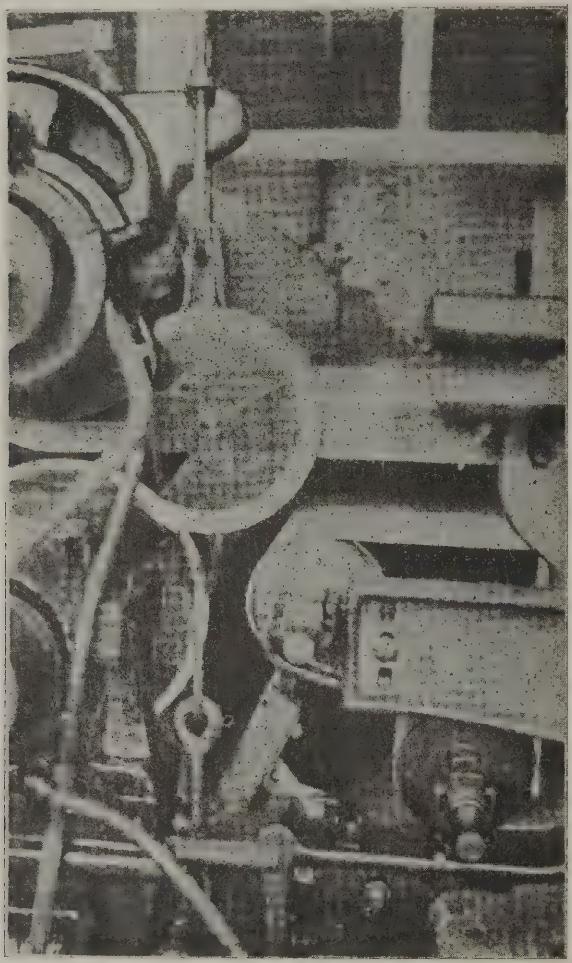

Fig. 4

Figs. 5 and 6 show comparative steam figures which were obtained with different balances in felt construction. It will be noted that a reduction of about 10 p. c. in steam consumption was obtained by merely changing the balance of felt construction; this entailed practically no loss in felt life, was accompanied with an ease-of-running property meaning freedom from breaks and also spells longer life of dryer felts.

In general it costs about twenty times as much to remove water at the dryers as it does to remove it at the presses. It would seem then that all possible efforts for increased water-removal efficiency in felts are well worth while. The fact that a 10 p.c. reduction in steam means a greater saving than the entire cost of the felts is indicative of the possibilities in such research.

The general picture of decreasing efficiency in felt performance applies of course to each of the press felts and to insure a drying condition as constant as possible from day to day, it is necessary to balance up the new and old felts on the machine. The fluctuations in balance of performance are reflected in the steam figures and it will also be noted that the variations are much less with water-removal felts. In other words, there are possibilities in the

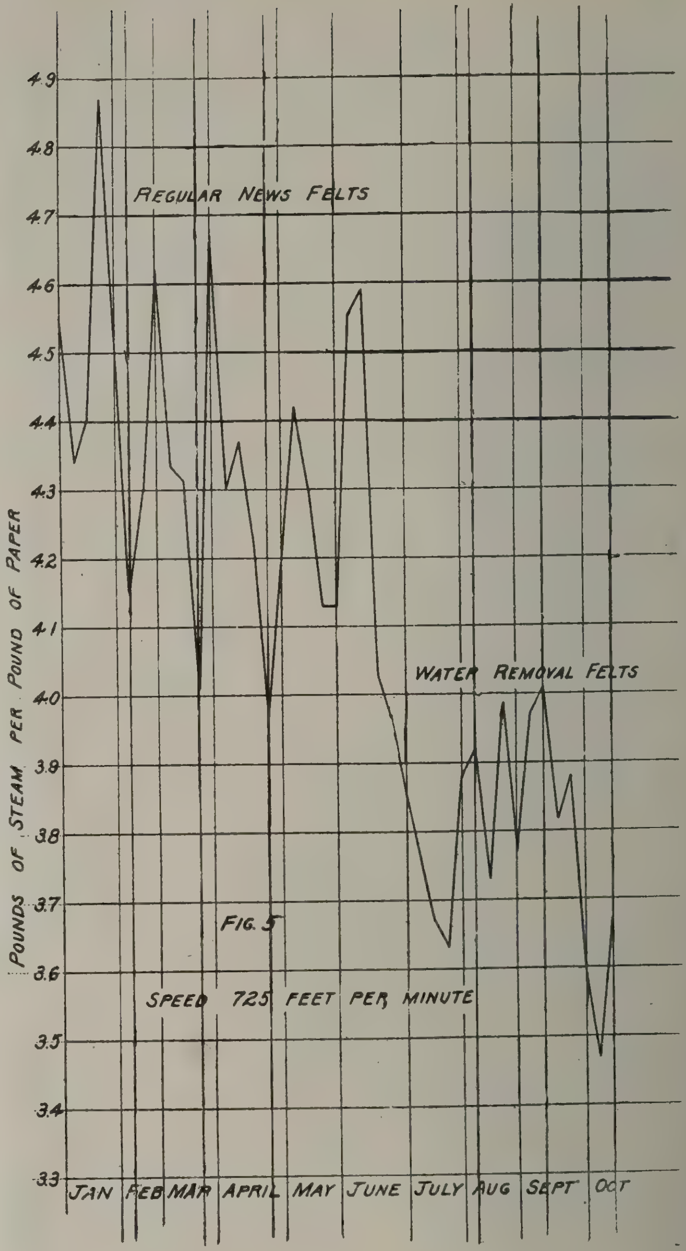

FIG. 5

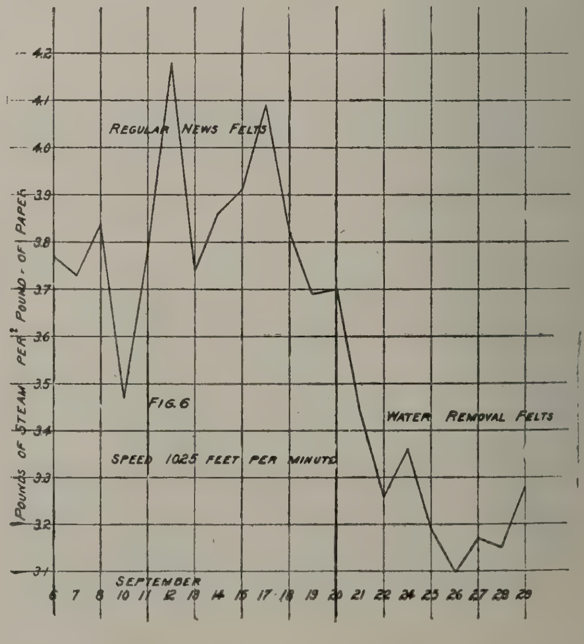

FIG. 6

felts of producing lower steam costs and also a more constant performance of machine conditions. The ideal felt of course is the one which will remove the greatest possible amount of water each day and also remove the same amount each day.

Limitations of Water Removal Felts

The uniformity of pressing and the distribution of the wearing effects across the felt may be followed by carefully testing the felts and noting how the wear has been distributed. Figs. 9, 10 and 11 show relative tests of warp and filling at different sections across felts after use in different conditions. The variations in crown conditions and uniformity of pressure distribution may easily be traced. The filling of the felt reflects the changes more sensitively than the warp threads of the felt. Fig. 7 shows a photograph of the cross-section of a news felt against the filler direction and shows the warp threads, which run lengthwise and in the machine direction, virtually buried in the filler. It is evident that the filler of the felt must resist most of the abuse. Fig. 8 shows a photograph of the cross-section of a news felt against the filler direction after use on a paper machine. The packing down of the felt and the loss of filler cushion are clearly shown.

Now there are two essential attributes of a felt, toughness and water-removal ability. It so happens that these very qualities are diametrically opposed to each other in felt construction. Every ounce of *toughness is imparted to a felt at a sacrifice of some water-removal.* The limit of water removing ability which can be built into the felt then is the demand for toughness and the severity and lack of uniformity in the practical working condition. Uneven distribution of pressures either through crowns, unbalanced weighting or roll variations are all serious handicaps for the application of water-removal felts.

Hurried starting-up of felts with insufficient wetting and allowance for the maximum shrinkage in length and widening of width can also only be met by designing felts with more toughness and less water-removal. The starting-up of a felt is very fundamental and it is the inherent nature of all woolen felts, through a certain characteristic of manufacturing process, to demand this careful wetting and shrinking at the start in order to obtain the best results. In the process of felt making, the felt is felted to dimensions shorter in length and wider in width than those at which it performs on the paper-machine. In this felting process, the fibers are not only knitted but there is also considerable bending and folding. These bends and folds may be removed by stretching and this the felt-maker proceeds to do by stretching the felt and drying it at the length where it is required to run. This stretching in length is also accompanied by a shrinking in width to the desired finished width. Now when this fabric is again wet up, it exhibits a tendency to shrink in length and widen in width, tending to revert back to the size at which it was felted. This shrinking and knitting imparts a setting quality and resistance to stretching which the felt-maker can thus supply to the best advantage. If the fabric were felted to the desired finished size, and not subsequently stretched in the felt mill, then a very great ease of stretching would only manifest itself in the paper-mill and this would entail a great many uncertainties. It is this ease of stretching which the felt-

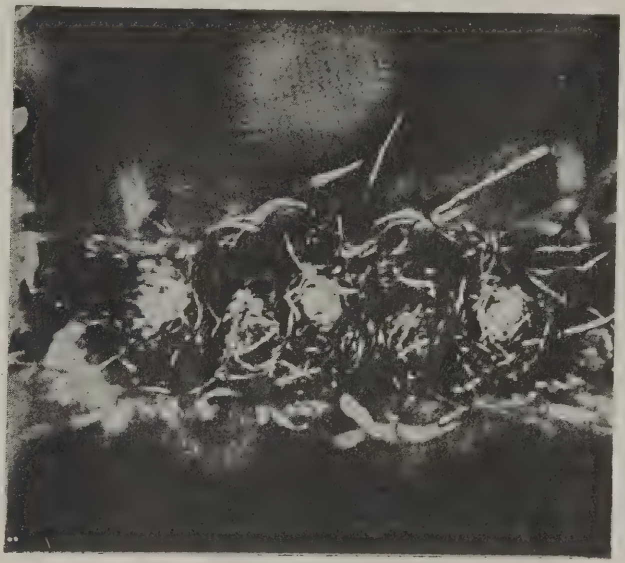

Fig. 7

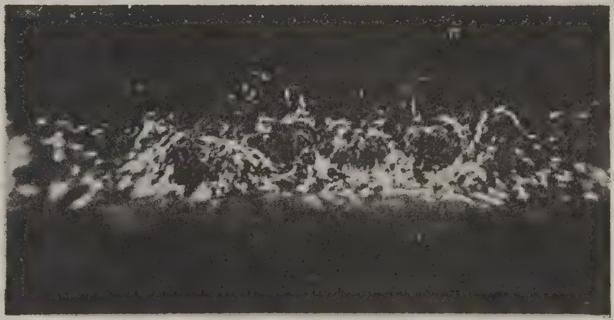

Fig. 8

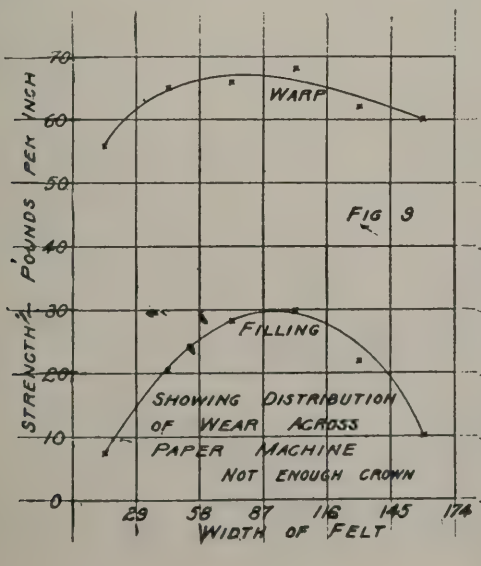

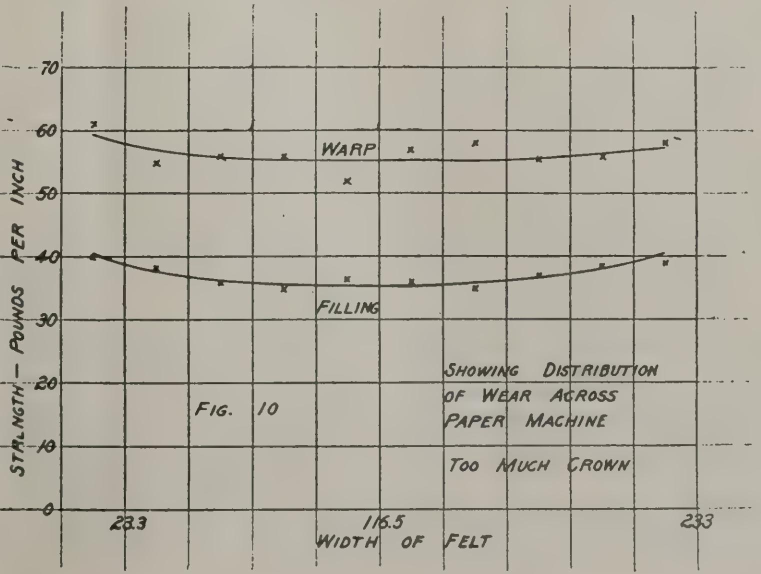

maker removes from the fabric by stretching it before application on the paper-machine. It is a necessary process and there is no knowledge at the present time which indicates that this process can be avoided.

The whole theory of the running size of a felt is connected with this process. The felt shrinks in length and widens in width upon being wet up. The felt is then tightened up so that it will run and it continues to stretch slightly all during the run. This stretching in length is accompanied by a narrowing of the width and this tendency to narrow should balance the tendency of the felt to widen so that the felt should run at all times at its proper width.

To insure the maximum of knitting and setting of fabric, sufficient time for shrinking and very thorough wetting is necessary. Manipulations in the paper-mill in which this process is not performed force the felt-maker to build tougher felts initially and this he can only do at a sacrifice of water-removal.

Toughness and water-removal are two inherently opposed properties in felts and neither can be supplied without a sacrifice of the other. However, this does not necessarily mean that a water-removal felt should net a shorter life. I believe it is generally true at the present time that for all uniform and smooth conditions, felts are removed largely because they become hard and boardy and are inclined to mark and crush the sheet. Generally they are not worn out and still possess plenty of body. There is no evidence at hand to indicate that a water-removal felt should give less life than the ordinary tough type of news felt which even now is not worn out when taken off. It is true, however, that a water-removal felt does not possess the foolproof construction of the type of tough felt and is not quite as resistant to wide variations in machine conditions.

Conclusion

It has been attempted in only a brief manner to outline some of the principles of water-removal and to relate some experiences in a practical way. The papermaker's felt is a very important item in the cost of papermaking. Literally the felt cost comprises only a very small fraction of the total cost of paper but nevertheless it is intimately connected with a whole series of operations and costs—steam costs and tonnage production figures are all influenced very materially by the type and quality in the papermaker's felt. But there is as yet very little understanding of the mechanism of water-removal at the nip and I am sure that on the part of the felt-makers, we have as yet hardly begun to understand the properties and possibilities in our product. We have much to learn about wool and we have much to learn about the functions which our products should exhibit to the best interests of the papermakers. Through a continuance of the team-work and co-operation which has been enjoyed in the past and the closest of study of conditions, however, there should be ample encouragement that progress can be made and the many problems solved as they present themselves.

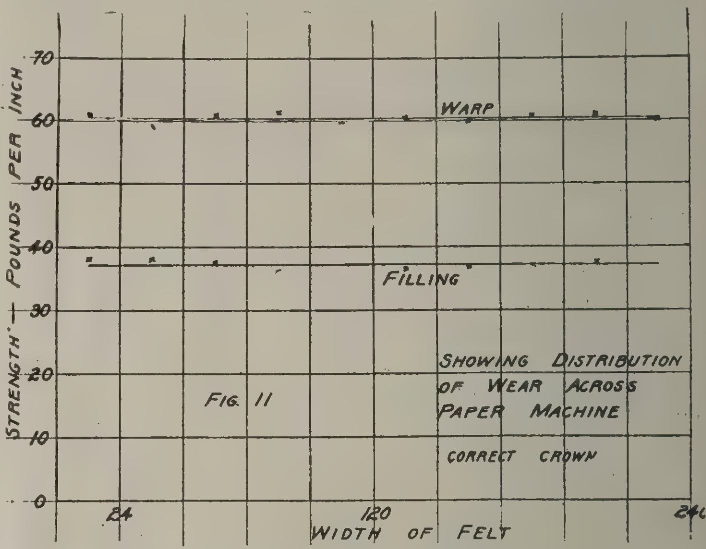

FIG. 11

ROSEBUSH LOOKS FOR AN IMPROVEMENT

General Manager of Northern Paper Mills is Frank in Predicting an Improvement Over 1923

THE outlook for 1924 shows an improvement in the paper business with indications favoring little change in wages in the mill or prices obtained for the finished product, according to Judson G. Rosebush, general manager of the Northern Paper Mills, who is financially interested in several other Wisconsin mills.

The first six months of 1924 will be better for the paper business, and for business in general, than the last six months of 1923, Mr. Rosebush said in an interview. Compared with the first six months of 1923, they will be characterized by "more confidence and less buoyancy," Mr. Rosebush said.

While no radical changes are looked for in any direction, paper production is expected to be better this year than last. Pulpwood, which recently has been higher in price, is showing a sag; whether this will be permanent cannot now be forecast, he said. A production of hemlock and spruce in excess of the needs of the mills is believed to be the cause. Wages, he predicted, would remain about where they are, with no immediate prospects of increases or decreases, and the same is true of the working forces. Prices of the product he does not expect to see undergo any marked change.

Commenting on the general industrial outlook, with particular reference to the labor situation, Mr. Rosebush pointed out that a new condition has arisen. "People are placing more emphasis on comforts of life, and less on the necessity of strenuous industrial development," he declared. He illustrated the remark by remarking that buyers today would sooner invest their money in an automobile than in the stock of an industrial concern.

"The entire industrial machine of the nation is slowing down," he said. "People are seeking more comforts. Roosevelt today would not have nearly as many followers in his doctrine of the 'strenuous life' as he might have had 25 years ago. This tendency is exemplified in the growing prevalance of the Saturday half holiday and the eight-hour day. Wage decreases are being more bitterly fought for the same reason. People feel that there is no need for the importation of more labor, and for this reason the government's present policy on immigration is likely to become permanent.

"Yet, despite this 'slowing down' of the industrial machine, car loadings for the last six months of 1923 were the greatest in our history, proving that people are consuming. The nation has a tremendous capacity for consumption, and, while strange, the situation is being looked forward to hopefully."

The European situation has a minor bearing on business prosperity in this country, Mr. Rosebush declared, asserting that with the exception of wheat and cotton European consumption amounted to less than 5 per cent of the country's production.

In brief, after the depression of 1923, which reached the "valley" in the summer, climbing upward to December, the nation's business on a sounder basis than at the opening of the last summer, is looking forward to 1924 with "caution and confidence."

Parchment Company Rushed

All production records for the Kalamazoo Vegetable Parchment Company will b shattered during the next twelve months according to reports submitted at the annual meeting during the week. The new mill just placed in operation will tremendously increase the capacity of the plant. Present orders will keep the mill busy for a long time and new orders are being received at a rate unprecedented, since the days just after the war. Frank Mostellar was elected a director to succeed the late C. A. Peck. The other officials and directors were re-elected. The officials are: president, Jacob Kindleberger; first vice president, Frank Mostellar; second vice president, James A. Greenlee; secretary, S. Ward Kennedy; and treasurer, C. S. Campbell.

Pyl Heads Allied Mills

John A. Pyl of Kalamazoo, was electe vice president of the Allied Paper Mills Inc., at the annual election of officers during the week. He will succeed Arthur L Pratt, former president of the King Paper Company and one of the best-known men in the paper industry in Michigan. By refusing to fill the vacancies caused by the deaths of George Hanselman and C. A Peck and by dropping E. J. Dayton o Detroit at his own request the stockholders reduced the membership of the board of directors from 22 to 19. Orders are increasing in number and volume, it was reported. The officers for the next year are: A. G. Gilman, president; John A. Pyl, vice president; secretary, George S. Davis; and treasurer, S. B. Monroe.

The Matter of Groundwood Testing

Here Is a Discussion of Something That Every Mill Has Battled With at One Time Or Another

By C. S. V. HAWKINGS
Chief Chemist, Price Bros. & Co., Limited

The subject of Groundwood testing is one that is always in debate in the paper mill. While every mill must proceed on its own initiative, these observations set down from the paper mill of Price Brothers & Company, Limited, at Kenogami, P. Q. should catch the attention of all paper men in both America and Canada.

IN RECENT YEARS the subject of groundwood testing has been before the attention of the technical men to a great degree. At some time in this period practically every concern manufacturing groundwood in any quantity has endeavored to establish some system of control work that would enable the operators to discover the nature of the stock as represented by a numerical standard. For this purpose there are several machines at present on the market. The most important of these types are the Green Freeness tester manufactured by the Star Brass Manufacturing Company and the Schopper tester as sold by the Foreign Paper Mills Inc. All types, however, resolve themselves into the same fundamental principle. A cylinder containing stock of a known consistency has a wire fastened to the bottom. The white water and stock is allowed to drain through this wire and the rate of drainage is measured. These main details are then divided into particular modes of procedure which differ more or less with each mill. In fact it is doubtful if there are any two mills following exactly the same procedure. As a consequence, figures which are quoted in this paper, will bear no significance except as compared to other figures obtained by exactly the same method. Inasmuch as the general tendency should be the same by any procedure, this discussion will be confined to the particular type of apparatus and the methods in use at the paper mill of Price Brothers & Co., Limited, at Kenogami, P. Q.

The routine procedure followed at the above mill is as follows: Samples of stock are taken from (1) the diluted groundwood stock as pumped to the screens, (2) screened and deckered stock, (3) paper machine stock as delivered to the wire. Unfortunately the Grinder Room is located at some distance from the paper mill so that the time consumed in pumping, together with the time taken for the test caused the results to be of little value for control purposes. To offset this, a small screen and decker were built and installed in the grinder plant. These are of the same general type as the regular screens and deckers and have been found to give good satisfaction. See fig. 1.

All stocks are diluted to a consistency of approximately 0.4 per cent bone-dry brought to a temperature of exactly 68 deg. F. and three determinations made of the quantity of side drainage from the funnel of the apparatus. The average is taken as the final result. Each determination is made up of 1,000 ccs. of diluted stock and all dilutions necessary are made with fresh water. The instrument used is shown in Fig. 2.

In order to determine the actual consistency, a sample of 1,000 grms. is weighed out, filtered on a piece of linen in a Buchner funnel, dried with an electric iron on a hot plate until no further steam is evolved and given a final drying of about five minutes in an electric oven at 135 deg. C. Having obtained the drainage in ccs. and the accurate consistency, the figure is corrected by experimental curves to the reading at exactly 0.4 per cent bone-dry consistency. The curves used for correction are shown in Fig. 3.

For instance, should the freeness be 70 ccs. at a consistency of 0.45 per cent. The point on the chart is found corresponding to this and a line drawn through this point parallel to the nearest determined line. This line crosses the 0.4 per cent at a point corresponding to a freeness of 81. The corrected freeness is then 81 ccs.

The time necessary for this test is of course one of the main features. We have found that it takes approximately fifteen minutes from the time the sample is brought to the testing room until the final corrected figure is obtained.

In outlining the above procedure, I do not wish to claim that it is the only procedure. In fact instead of running the consistency at 0.4 per cent bone-dry, some mills are taking this to 0.3 per cent consistency. Some are using a centrifuge for determining the consistency instead of the filtering method. Some bring the consistency to a definite and accurate figure and correct for temperature. It seems quite reasonable to believe that any of these methods will give comparative figures of the same value. The real value of any of these methods providing we establish their individual accuracy is a question of time alone. Inasmuch as we have found that fifteen minutes after the sample is collected is quite fast enough, we have continued with the above method.

Perhaps the most important part of the work on this subject is a discussion of the factors that influence the freeness figures as determined by the above methods. In a general way these remarks should apply to all methods of procedure. I will treat this subject under the following heads:—

1. The effect of white water on Groundwood stock,
2. The effect of white water on Sulphite stock,
3. The effect of white water on Paper Machine stock,
4. The effect of different mixtures of Sulphite and Groundwood,
5. Time,
6. The changes due to changing consistency and temperature.

1. The Effect of White Water on Groundwood Stock

Samples were collected and to these, different percentages of white water were added. Both samples were brought to a consistency of 0.4 per cent bone-dry and the varying mixtures formed.

As the white water itself is an unknown quantity, the figures obtained merely show the tendency. Several conclusions may however be drawn from the facts found. The white water has a decided slowing effect, decreasing in magnitude until a minimum is reached, when from 40 to 60 per cent of white water is added the freeness came to approximately the same in all experiments, namely 34-36. After this the stock continued to increase rapidly in freeness.

2. The Effect of White Water on Sulphite Stock

The procedure still remains as before. The curve of a typical set is shown in Fig. 5.

The white water is shown to have a very marked effect on the sulphite. Again the freeness goes down to about the same level.

3. The Effect of White Water on Paper Machine Stock

The procedure in this case was the same as before with the exception that Paper Machine stock was substituted. The results as found are shown in Fig. 6.

The white water evidently has the same effect but to a lesser degree. It is notable that the slope of the curve is much less for additions up to 60-70 per cent of white water. After this, the curve follows curve 1 very closely. It is also notable that the curve shows a minimum of approximately the same as that in the former cases.

4. *A Study of the Effect of Varying Mixtures of Sulphite and Groundwood*

The curve showing the results obtained in these experiments is shown in Fig. 7.

The gradual slowing effect of groundwood is clearly shown. The curve is almost a straight line.

5. *The Effect of Stock Standing in a Tank over a Period of 24 Hours Was Investigated*

Samples of ordinary Paper Machine stock were thoroughly mixed and tests run at intervals during 24 hours. Corrected freeness readings show a slight variation in twenty-four hours.

11:45 A. M.	97
2:45 P. M.	95
5:45 P. M.	94
8:45 P. M.	94
11:45 P. M.	95
5:45 A. M.	94
11:45 A. M.	96

It is certainly evident that within the limits of experimental error there are no changes worthy of mention in twenty-four hours.

6. *Changes Due to Changing Consistency and Temperature*

To study the effect of consistency and temperature several samples of varying freeness at different consistencies

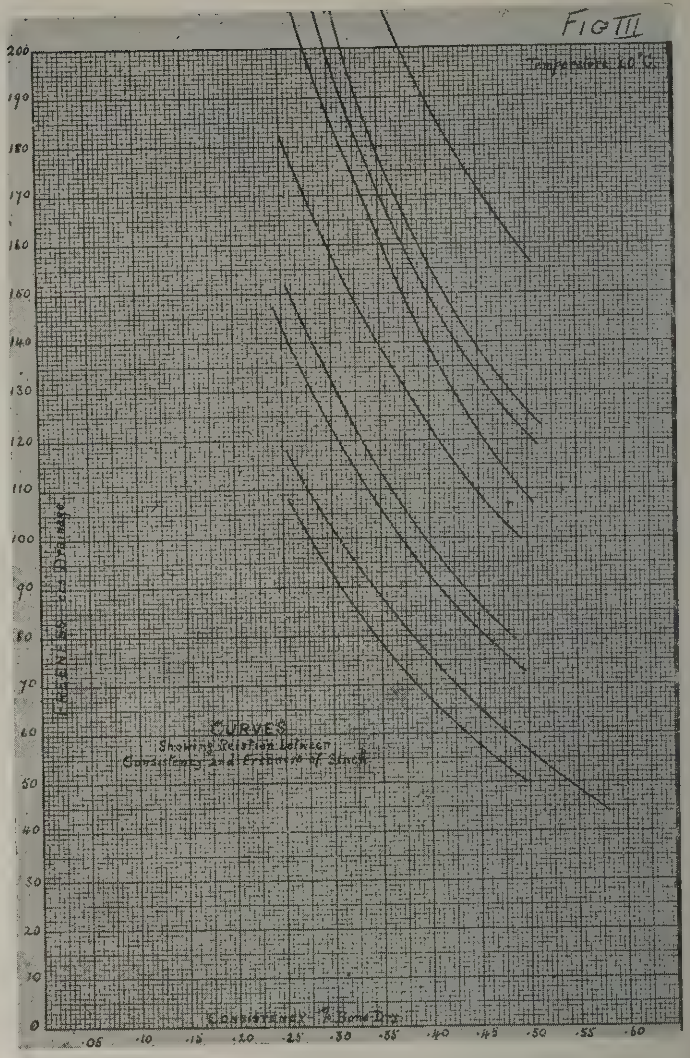

Fig. 1.

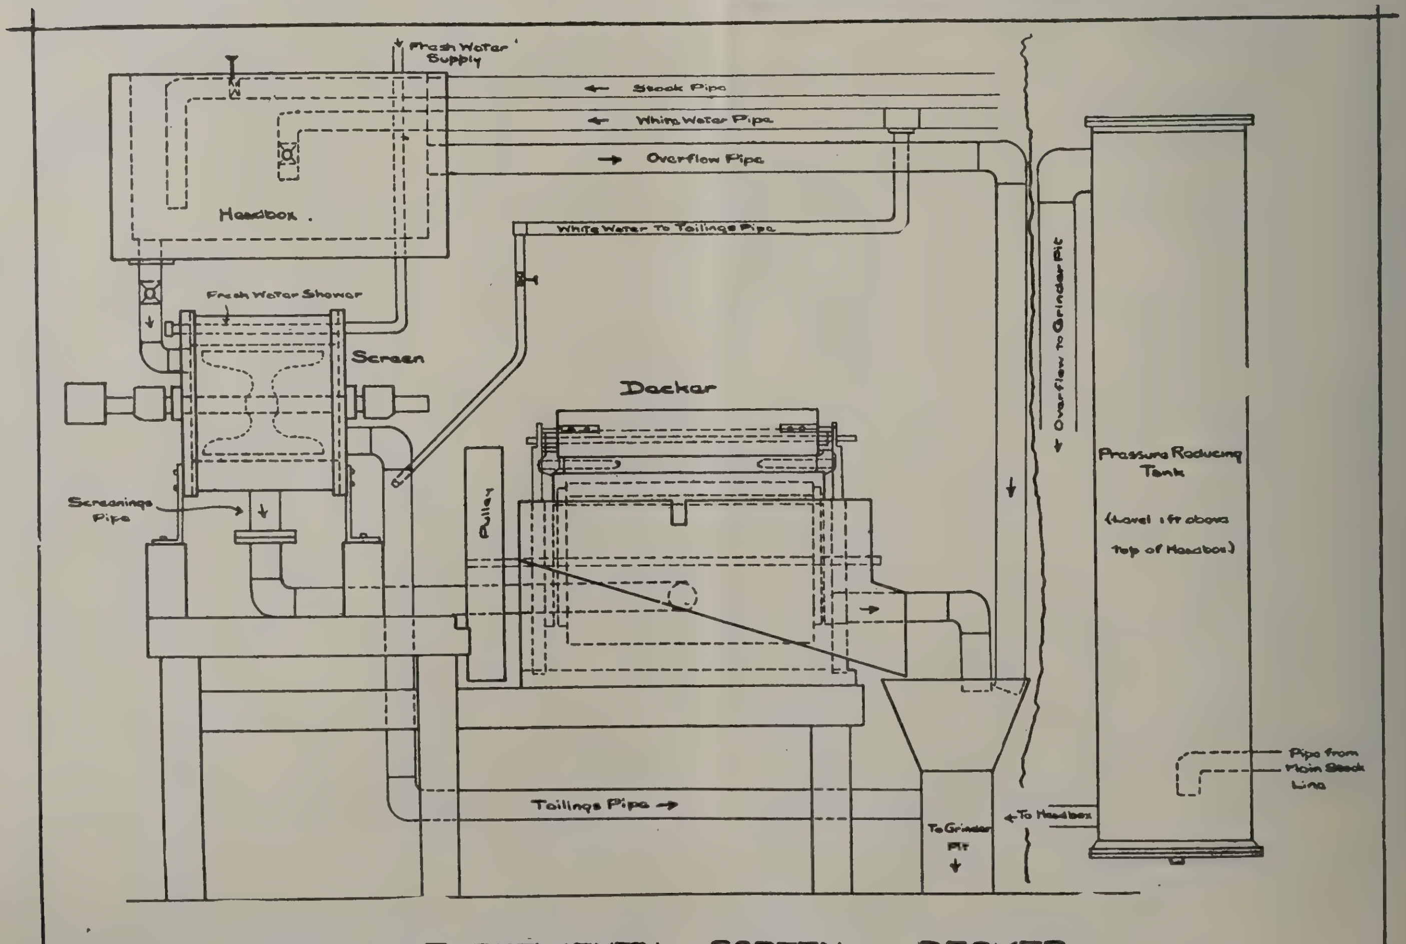


LAYOUT of EXPERIMENTAL SCREEN and DECKER
Scale 1"=1'

were changed in temperature from 60 deg. F. to 90 deg. F. in steps of 4 deg. F. These curves are shown in Fig. 8. No. 1 is a preliminary test,

No. 3, 5, 6, 9, 13, 14 are tests run at a consistency of 0.4 per cent bone-dry.

No. 15, 16, 17, 19, 20 are tests run at a consistency of 0.3 per cent bone-dry.

No. 23, 25, 26, 27 are tests run at a consistency of 0.2 per cent bone-dry.

The range of freeness at 60 deg. F. varies from 56 to 207. The remaining experiments are not plotted, but an examination showed that they followed the others very closely and are not included because they would tend to confuse each other with too much detail. The conclusions we can draw from a study of these curves are that:

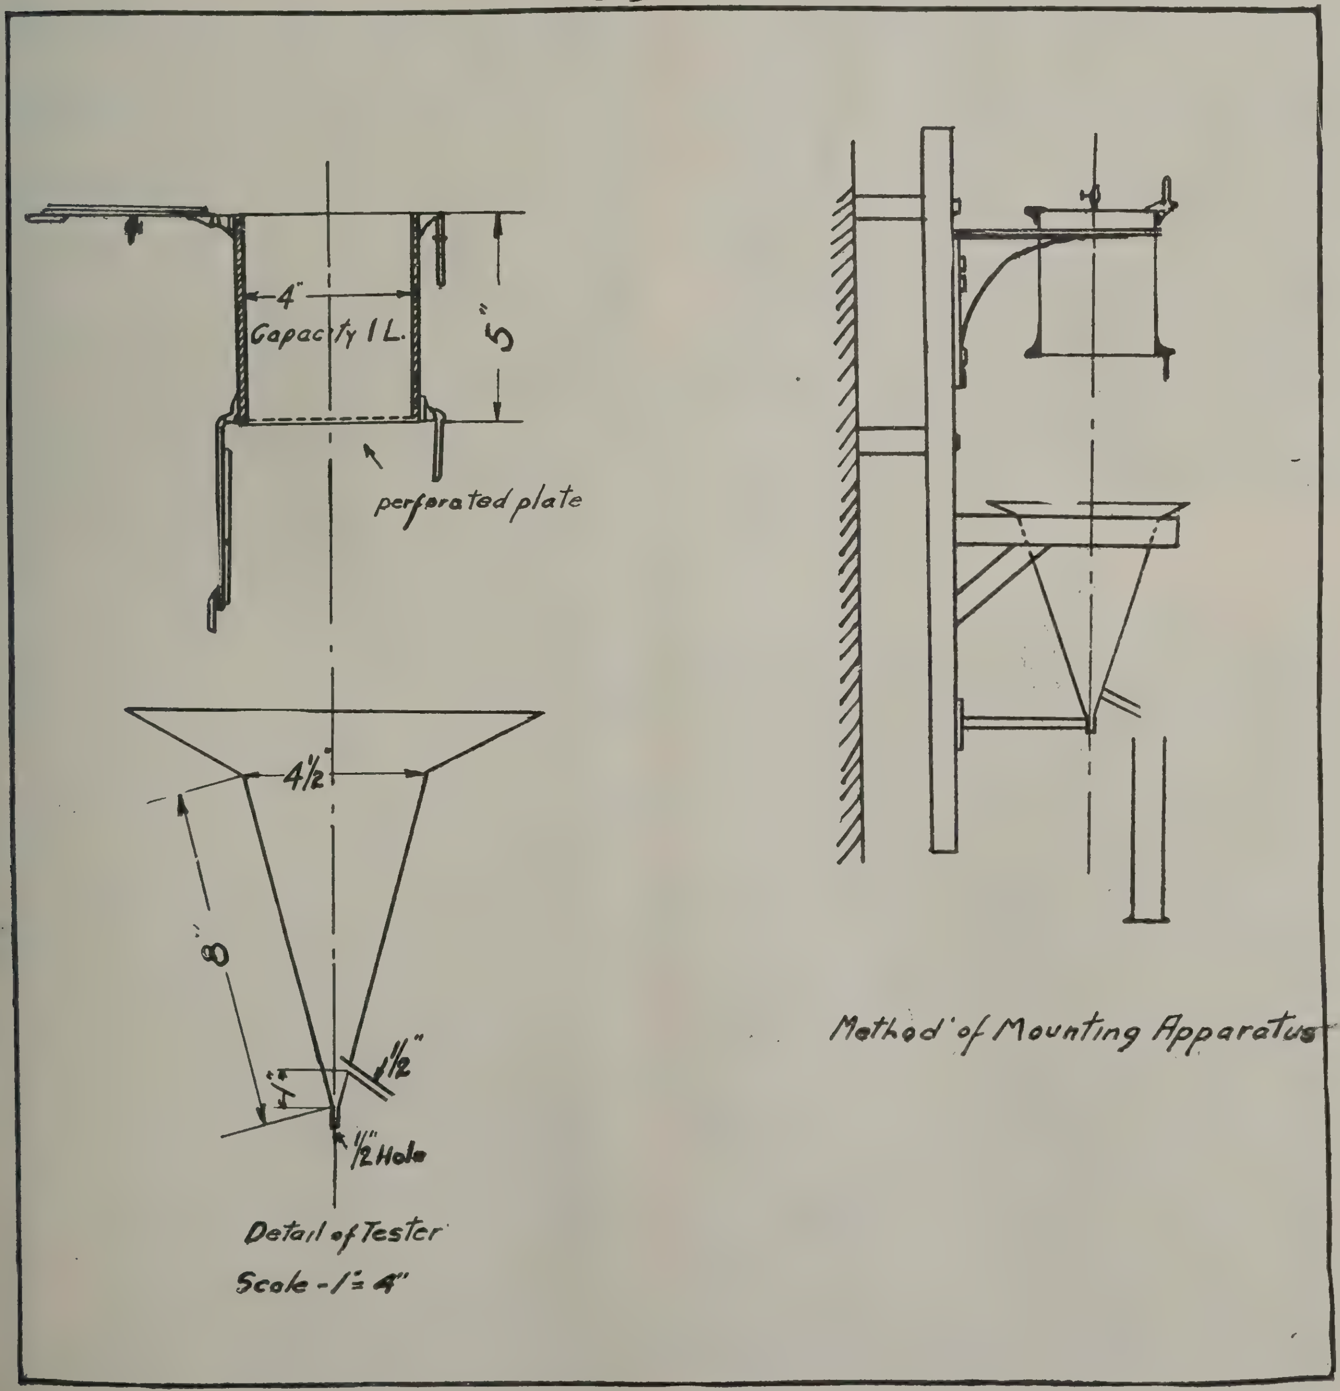
(a) Within the limits of temperature shown, each curve approximates a straight line;

(b) That the rate of change of freeness with temperature varies as the original freeness.

For the sake of outlining a possible correction curve for temperature, we have plotted the curves shown in Fig. 9.

It would appear from an examination of these curves that example of a correction possible from these curves, had the freeness at say 60 deg. F. and is independent of the consistency at which one requires the stock to be run off. As an example of a correction possible from these curves, had the freeness been found to be 100 at 80 deg. F. the corrected paper machine. Fig. 10 shows a part of the test made from January 18th to March 1st, 1922. On this are plotted,

FIG II



freeness would be 84 at 60 deg. F. It would be practically impossible to correct for both consistency and temperature at the same time so that it appears that either way of choosing a routine procedure is a matter of convenience only.

A rather interesting part of the work on freeness is the attempt to trace the action of the varying stocks on the

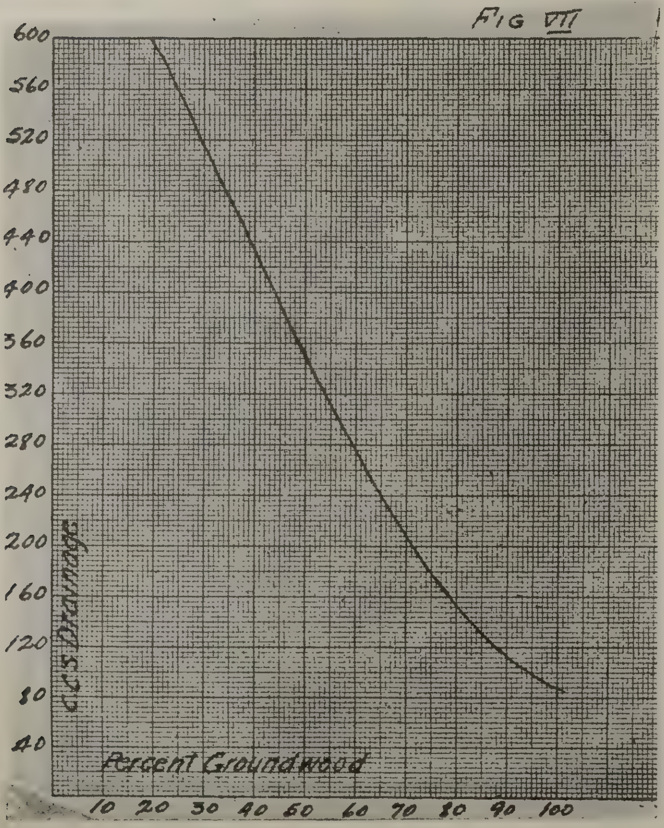

Fig VI

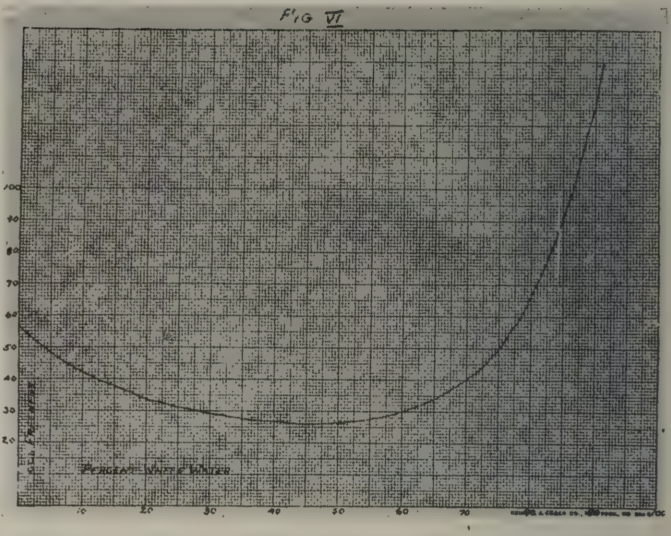

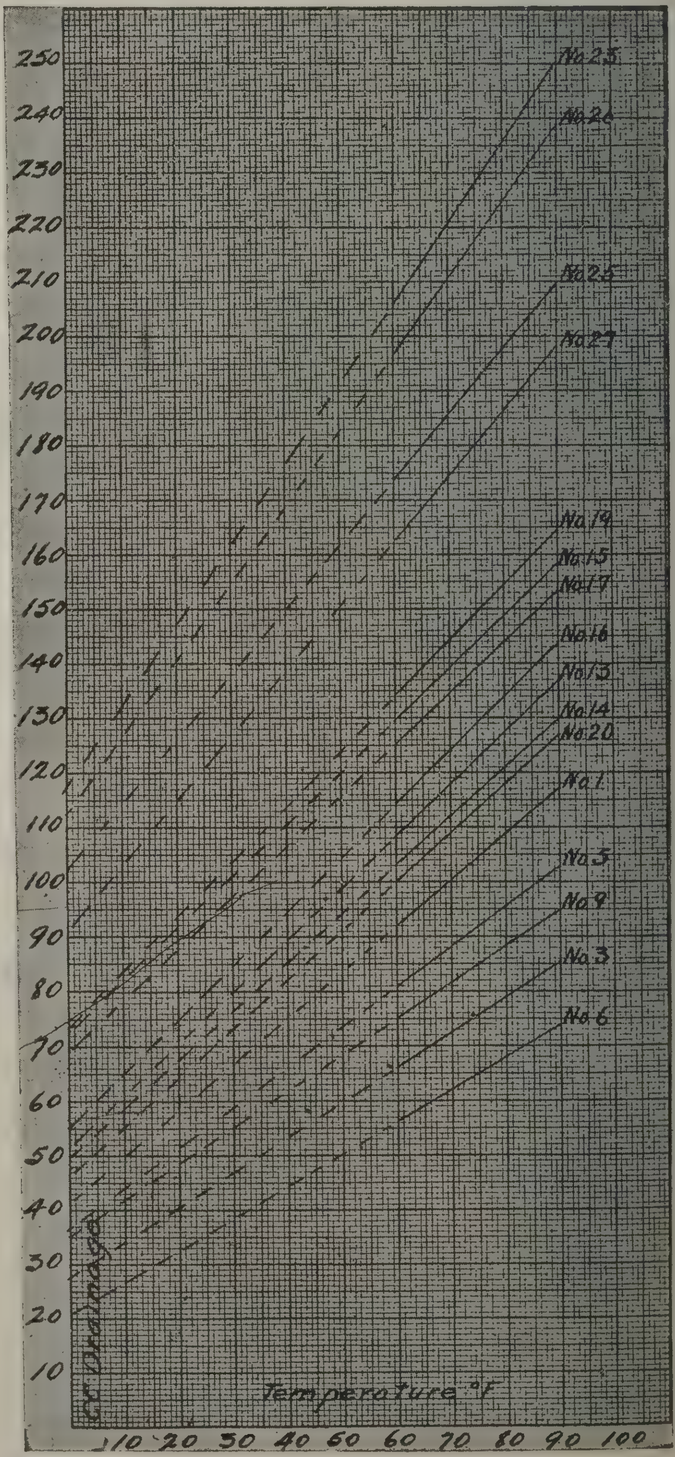

corrected freeness of screened and deckered stock, corrected freeness of paper machine stock and freeness on paper machine stock as run.

Notes on this curve include, valve settings for white water as regulated by the machine tenders. This curve shows that in general the freeness as determined by the test indicates the experience of the machine tenders. There are of course exceptions to this and herein lies the reason why so many have found this test to be of little use. To more fully discuss this, it is necessary to refer to screenings tests made on stock of varying freeness readings. It was found here that in general the freer the stock the greater was the percentage of coarser fiber. The following tables show this, as well as some discrepancies which we will attempt to explain later.

	%	%	%	%	%
Sample	1	2	3	4	5
Freeness	101	123	188	256	325
Retained on 20 mesh	1.0	1.4	1.5	3.0	4.2
Retained on 65 mesh	33.2	44.3	47.8	52.9	51.6
Retained on 100 mesh	9.9	12.6	12.0	9.4	8.9
Retained on 200 mesh	16.9	13.7	13.3	11.5	13.5
Passed through 200 mesh	39.0	28.0	25.6	23.2	21.8

There is one important feature of this screening test which caused a good deal of trouble at first and which has been explained to a certain degree before. If more than a certain amount of flour is included there is a point reached at which further addition of flour tends to make the stock very much freer, due no doubt to this part passing right through the tester. One can easily understand that it would be possible to have varying mixtures of different sized fibers which would give an identical freeness and yet be totally different as to nature. It is for this reason, I believe, that the freeness test alone is of little value. It is apt to be very misleading when any very great changes are brought about in the groundwood plant. If we could supplement this with a quickly determined numerical indication of the relative proportions of fine and coarse fibers, the two together would be an excellent guide to the control of groundwood quality. One does not wish to minimize the good which can be accomplished by the freeness test alone and the figures so obtained and used by an operator who is familiar with the general conditions of the cutting surfaces, etc., are invaluable. It is my opinion that until we have obtained some other companion test to this one that the results so obtained will always be subject to criticism from the precise operating point of view.

In conclusion, it is essential to note that with such a number of methods in use at different mills, there is little if any use in exchanging data as to conditions of freeness. Would it not be possible to have these methods and types of apparatus standardized to such an extent that figures obtained in one locality would be comparable to those obtained elsewhere? Undoubtedly there are many criticisms to offer even in the present design of testers. It has been our experience that it is the exception rather than the rule to have two testers by the same maker read absolutely the same under all conditions. The time has come when this test must be standardized or pass into the discard as subject to too many variations to be of real value to our industry. Our neighbors to the South have gone into this question at some length and there is no reason why we should not do likewise.

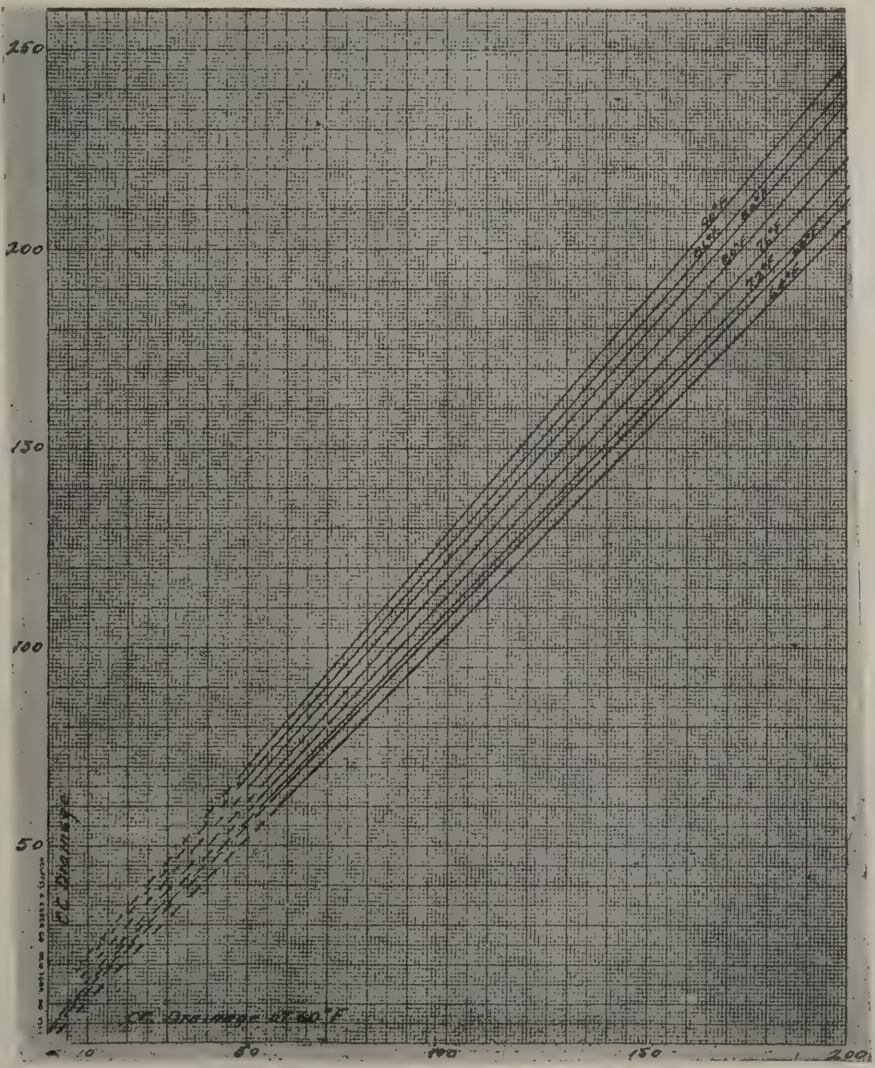

Fig. IX.

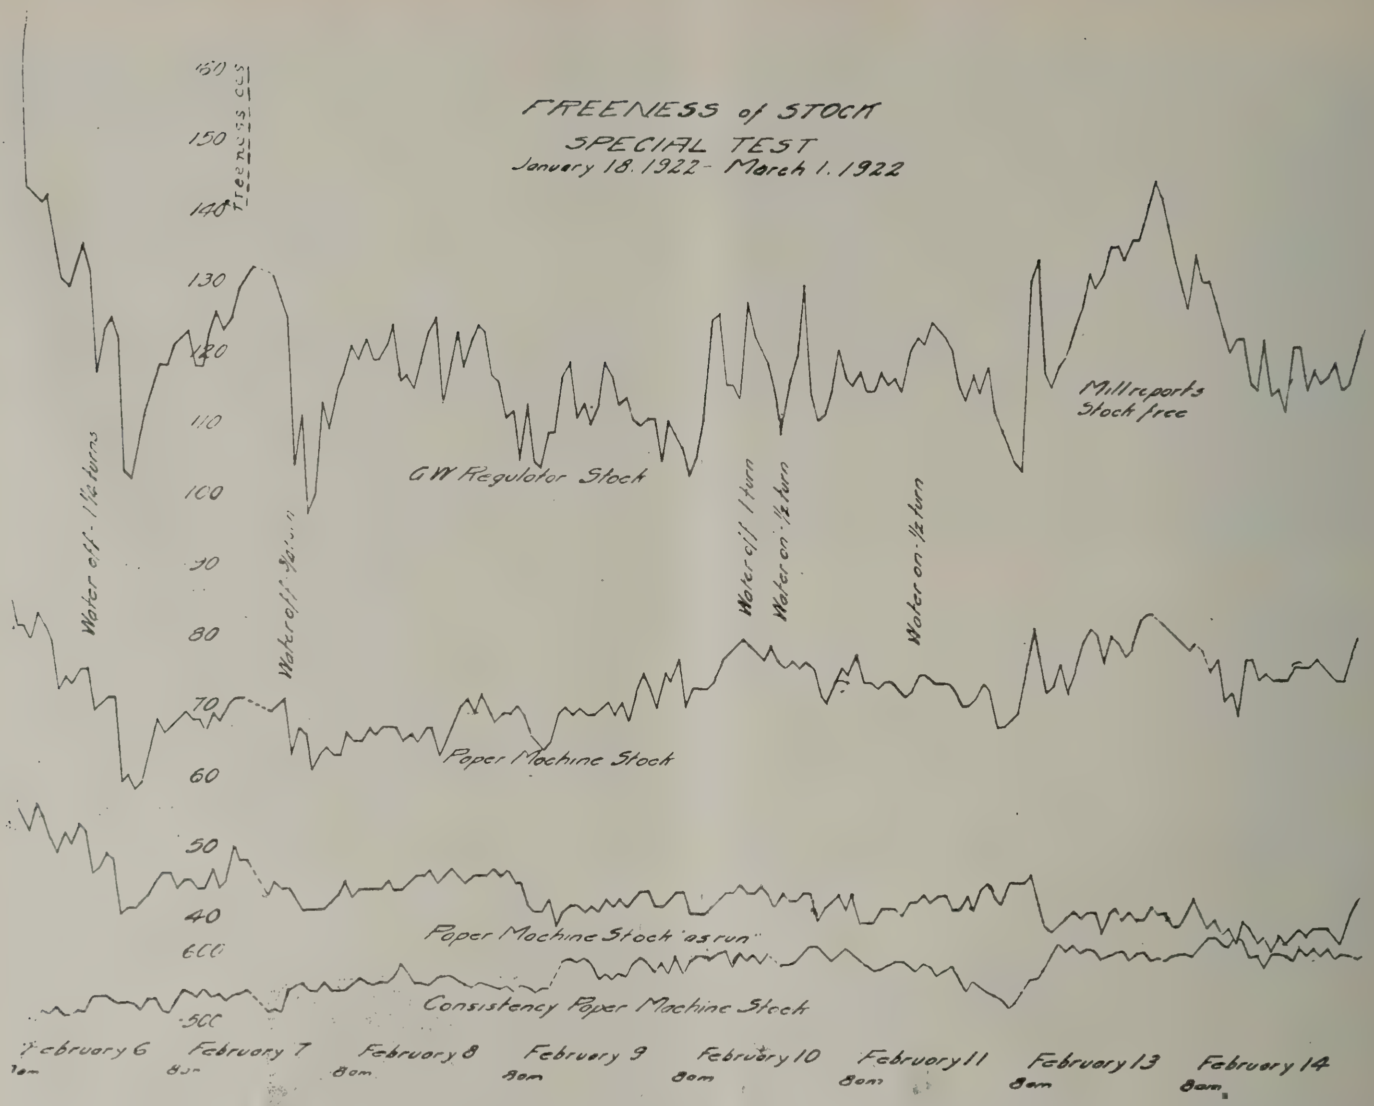

Floors for Shipping Rooms

New Ideas on Flooring Presented at Annual Meeting of Technical Section, at Montreal, by an Authority

By **CHARLES A. MOLLEN**
Consulting Paving Engineer

IN PREPARING this short paper, I have tried to view the subject so as to understand what the manager of a paper mill would want to know about asphalt mastic flooring as compared to the other floorings available in order to enable him to decide what is best for use in the shipping room of his paper mill, as well as in other places where the floor problem presents special difficulties—at the wet end of the paper machine, for instance.

Not a competent judge am I of what special qualities in a floor a paper man needs; for I am a paving man, and every man to his own trade. But I have been informed that wood flooring fails in the shipping room because it splinters and the fibers tear out under the heavy hand trucking, while the concrete floor is unsatisfactory because it crumbles under this kind of traffic, becomes uneven and rough, and is the cause of considerable dust. In view of these facts, what I have to say may be of real value to some of those present.

Asphalt mastic is not a floor, it is a floor covering. Being a more or less plastic material, it must have under it a relatively rigid supporting floor or foundation of either wood or concrete. The asphalt mastic is usually only about one inch in thickness, and must be compared with the finishing boards of a wood flooring or the top course of a concrete floor. It is sometimes well to get exact place in the order of things before proceeding too far with the consideration of such a problem.

Asphalt Flooring is plastic; not rigid, not elastic. It is like putty or sheet lead in that it stays where it is put until some other force comes along to ré-put it into some other shape. A good plastic mastic flooring is a proper compromise between the two extremes of rigidity and plasticity, both of which qualities are undesirable in a flooring or a pavement surface in excess of the serviceable mean.

The nature of asphalt surfaces is not usually very well understood I find in talking with most engineers and architects who are not specialists in the paving field. To begin with, it might be said that the same general principles control whether the asphalt mixture is laid as a sheet asphalt pavement on a roadway or as a mastic covering for a floor. In the minds of many, there seems to be an idea that there is a great difference between the mixtures used for these two purposes.

An unwarranted significance has come to be attached to the more general use of the word mastic in connection with asphalt mixtures when they are used for flooring instead of for street paving; but any of the more common asphaltic mixtures can be used successfully in either place, subject only to such changes in design as may be dictated by the thickness required, the temperature conditions, traffic, or other extraordinary surroundings.

Compared to Hydraulic Concrete, the special qualities of bituminous concrete are easily explained. Portland cement concretes, and mortars, with their cement-water chemical combination as a bonding medium for the mineral aggregate, possess a rigidity with which we are all familiar. Bituminous mixtures, asphalt or tar-concrete mortars or mastic, with approximately the same mineral aggregates, require merely the use of the bituminous cementing medium which has a temperature set, and remains plastic, instead of having the chemical set which makes the hydraulic cement concrete so rigid.

Both types of concrete are made with the same general type of mineral aggregates, graded from any maximum size of stone, gravel, or sand down to the fineness considered desirable. In the asphalt mastic mineral aggregates, a proportion of pulverized limestone dust should be used which is about equal in fineness to the Portland cement in the hydraulic concrete. The most characteristic difference between the two types of concrete is the substitution of the asphalt cement which is viscous and binding, for the water that acts upon the Portland cement to make it bind.

Because it is far too soft was the reason given, not long ago, by the manager of a paper mill, for deciding not to use asphalt mastic flooring in his shipping room. It seems that an asphalt floor had been laid in another mill, about which this manager knew, probably the work of some rule-of-thumb man who did not fully appreciate the technique of the asphalt paving and flooring industry, and this particular flooring had proven too soft.

That was not a valid reason, however; for asphalt mastic floorings can be made as hard as concrete or so soft that it can be gouged into with the fingers, as maybe desired. This decision against mastic flooring was most certainly based on a lack of understanding of the material. There may be other very good reasons for not using asphalt mastic in a paper mill, concerning which I know not; but the statement that it is too soft is most positively not one of them.

Too much mystery engineering has in the past been the curse of both the asphalt street paving and the asphalt mastic flooring industries; as also of many other types of work. The so-called practical man who claims to have, or gives the impression that he has a vast amount of secret knowledge concerning the technique of asphalt mixtures, has been the bane of the industry since its early days. The mastic flooring men usually talk voluminously, for instance, concerning the special merits of what are known as European rock asphalts.

The value of practical men in any industry should not be underestimated. Any technician not himself engaged in the actual doing of the work, who will not listen attentively to the experiences and views of the practical workman, is simply lacking in good sense; but, on purely technical points, the practical man should submit his information to the technical man so that he may be able to interpret even his own experience intelligently. Each man needs the other.

The European rock asphalts, whose assumed superiority has been much advertised and never proven, can be duplicated quite closely in any American City; in fact they have been duplicated and the duplicates used extensively, and some of the very excellent mastic work done is with materials which never saw Europe at all. Once stripped of its mystery, European rock asphalt is a very simple subject. It is used in street paving as well as in flooring in Europe, where it is cheap; and anticipated the synthetic sheet asphalt pavement in North America.

One can synthetically produce what he wishes in an asphalt paving mixture; while if he insists on having one of the so-called products of Nature, then he must take more or less just what Nature has provided through the accidents of geological formation. In producing her native asphaltic materials, it is somewhat doubtful to my mind whether Nature had specially in mind street paving and mastic flooring as we know them today.

Great thickness is undesirable either in an asphalt street covering or an asphalt floor covering. Anywhere from three-quarters of an inch to one and one-quarter inches is all that would ever be required on the floor of a shipping room. The wear of asphalt surfaces is so slight that it need hardly be considered. The mineral particles, instead of being held in rigid position as are those in Portland cement concrete or mortar surfaces, are bound into the plastic asphaltic material which coats and surrounds them. In a way, an asphalt flooring can be said to be continually mending itself.

The old Pennsylvania station in Jersey City, laid between the New York City ferry exits and the entrance to the trains, has an asphalt flooring that antedates my earliest recollections; and, as far as I know, it is there yet. The constant walking over it, and the fact that it appears to be of the proper density and rigidity-plasticity compromise, made it almost indestructible. It was used very extensively for foot traffic before the Pennsylvania Station, at Thirty-Third Street, Manhattan, was opened.

The Canadian National Railways have an asphalt floor covering in the freight sheds on Wellington Street at Bridge Street in Montreal, which has given excellent service for 13 years, and is still in good condition. Metal shapes are dropped on this floor, constantly making indentations which are promptly ironed out by the ever passing hand truck traffic. I do not know who laid this floor, whether its excellence is a matter of accident or the result of a practical knowledge of the technique of the industry; but it is an example of what an asphalt flooring can be under such conditions.

The oldest asphalt surface now in existence, which has become famous in the industry, was the result of an accident, not knowledge; though it is the basis of a great deal of our present technical information. This pavement is on Vermont Avenue, between H and I Streets, Washington, D. C., and was laid two inches thick in 1880. I took samples of it a few years ago, and it is still almost two inches thick. The pavement is rendering good service today, and the records of the City of Washington show that its annual maintenance cost has been very slight.

Asphalt floors have advantages over asphalt streets in that they are protected by a building in which the temperature is more or less constant. The Vermont Avenue asphalt surface, for instance, is subjected to probably as low as zero several times during a winter and the temperature of the pavement surface itself often reaches 140 degrees Fahrenheit on a hot summer day; besides which, the rapid changes in temperature outside are not reproduced, at least with such severity, in a shipping room.

Widely varying temperatures are one of the principal enemies of asphalt surfaces, against which they are protected in a room kept at an even temperature. It does not matter what the temperature is, just so it is more or less uniform; because the rigidity-plasticity compromise can be adjusted to any given temperature. On street work, we have to adjust this quality to widely varying temperatures, and to the fact that some streets get their heaviest traffic in the summer, while others get theirs in the winter.

Actual wear is not a factor, as I said before, on an asphalt street pavement surface or on an asphalt flooring surface. It would take a great many years for either to wear out, as a cement concrete floor will do; because there is no appreciable crumbling and blowing away as in the case of a cement flooring under heavy truck traffic. This is prevented by the plastic nature of the asphalt flooring, which enables it to take up the shock of traffic without permitting the particles of sand or dust to be crushed, and tends to mend them even if they are slightly shattered.

All the voids in the aggregate of an asphalt paving or flooring mixture must be filled with the plastic asphalt cement, and slightly overfilled in most cases. The extent of the overfilling of the voids is one of the main factors in the rigidity-plasticity compromise. The other main factor is the consistency of the asphalt itself, which can be purchased from the refinery at any consistency desired.

Asphalt flooring is waterproof, if it is properly made; that is, if the mixing is so done that the particles of mineral aggregate are properly coated and there is a sufficient quantity of asphalt to fill the voids. If the mixture is not properly made, it may be porous and admit water and then the pavement or the flooring will disintegrate from this cause.

No place for water to enter should exist in any asphaltic. Some years ago, in connection with a lawsuit, we placed two compressed blocks of asphalt surfacing mixture in water in our laboratory. That which had failed admitted seven per cent of water by volume in a few days, while the block cut from a similar surfacing that was laid under our supervision and concerning which we had data, has been in water ever since, and it still fails to show any absorption. Where there were no unfilled voids or porosity, there was no place for the water to enter.

The ease of making repairs to an asphalt mastic covering is another item in its favor. If any small area has to be removed or requires replacement for any reason, the old material cn be remelted and relaid, and it is as good as when it was new mixture at the time the job was originally constructed. This procedure is quite common with many cities as regards asphalt street repairs over cuts made to get at sub-surface structures. The pavement surface is cut out in squares, the opening made, and then the squares are laid back. Later on, a small equipment comes around, remelts the squares, and relays them just as it would lay new mixture.

Any handy man can make repairs to an asphalt flooring if he has a small melting pan and the necessary material available. It may be thought desirable to keep a small quantity of new mixture on hand that can be remelted. A stock might just as well be set aside some place when the job is originally done. The only danger in making such repair work is through a careless man allowing the asphalt cement to burn by not keeping the mixture constantly agitated as it is melting.

To make satisfactory repairs to a Portland cement concrete floor surface is a very difficult matter, to say the least; for the repaired area must be kept out of use for several days while the cement is hardening, and the period should be longer. Repairs to wood flooring that is worn are also difficult to make, and not always satisfactory; unless the new planks or blocks are planed down to the true thickness of the old floor.

Walking on an asphalt flooring is easier on the feet than walking on hydraulic concrete. There is just enough give in the material so that it helps the workmen in this respect. For the above reason, possibly it may be an advantageous material to use in many other places in the mill besides the shipping room, though wherever oil will drop on it directly, a small pan should be placed to prevent the softening effect of constantly dropping oil. No slight amount of oil will be injurious but constant saturation with a light oil will gradually flux an asphalt surface and soften it to some extent.

A good surface is maintained on the floor with asphalt mastic by merely walking on it, as was the case in the lobby of the Pennsylvania Sation in Jersey City. In fact, the most difficult place for which to design an asphalt covering is for some floor or flat roof where there is no traffic, and rapid changes in temperature which tend to cause contraction cracks which traffic is needed to keep from forming or to mend after they have formed.

MENASHA, WISCONSIN

Heat Economy in Machine Room

Showing How Much Heat in the Machine Room is Not Profitable, Although Not Known by the Owners

By T. J. HIGGINS
Manager, Ross Engineering of Canada, Ltd., Montreal, P. Q.

FROM a heating and ventilating stand point, economies in other departments of the mill, while important, are dwarfed by those possible in the machine room, and as the various uses of air in the paper industry are so very numerous, space requires that we limit this article to its application in the machine room only.

However I will try to show not only the different methods of ventilating the machine room, but also what the problem is, and particularly bring out some of the knowledge which has been accumulated in the last few years on a subject which has in the past been treated mainly by "rule of thumb," and in accordance with the judgment of the individual designer.

In general I should say that the machine room presents not so much a heating problem as a ventilating problem. This is on account of the heat given up by the dryers, and which is almost enough to keep the room comfortable, even in cold weather, as to temperature, except possibly at the extreme ends of the room. There is however a large amount of vapor arising from the machine, and this amounts roughly to about 2 lbs. of water evaporated per lb. of paper. In other words a machine turning out 50 tons of paper per day, is evaporating approximately 100 tons of water per day, and this must be taken care of unless there is to be serious trouble with fog and condensation.

Probably the oldest system for ventilating a machine room was to permit the vapor-laden air to escape through the roof, either by natural draught or by the use of fans, and allow air to leak into the room to take its place. If this air came into the machine room from some other department of the mill, conditions were not very bad, but if it had to come in around windows and doors, the cold air would cause condensation and drip. The next step was to put steam coils under the roof to keep the temperature here above the dewpoint and prevent this drip.

The Matter of Forced Ventilation

Then came the system of forced ventilation whereby a quantity of air, practically equal to the air being removed from the roof, was preheated and admitted to the machine room. This was a big step in advance, and until very recently seemed to answer the requirement. The air was usually blown on the roof, as it was found that most of the condensation occurred there, and that by keeping the roof warm it could be largely prevented.

However, the application and the quantity of this air, varied, depending upon the opinion or judgment of the engineer and mill owner. The type of installation depended on how much money it was desired to put into the system, or upon how much power could be given up to the system, or on whether exhaust steam could be used for heating the air, and for the most part ducts were run wherever it seemed that there was the best space available.

It may be gathered from the foregoing, that little attention was paid to the method of introducing the air, or the manner of its application. Contracts for ventilating systems were awarded to the concern that would guarantee to deliver the largest amount of air and heat for the smallest amount of money. The volume of air was usually based upon changing the air in the machine room in so many minutes, and it became common to specify a five minute air change, or if that seemed too big an item for commercial reasons, a 10 minute change, or even a 15 minute change might do, in these cases it being considered necessary to heat the air to a higher temperature in order to offset the smaller quantity.

We need not point out that this method of figuring a system was all wrong. The practical experience that would cause a man to decide on a five minute air change for the reason that in some other mill it was used and worked out satisfactorily, does not take into consideration the construction of the building, the amount of glass surface, exposure, whether a warm or a cold roof, whether machine is hooded or not hooded, the amount of water evaporated, nor the fact that one machine room might have about half the cubic measurement of another mill, producing the same amount of paper.

The Real Test

The only test was—"Does it keep the room clear of all vapor and drip?" If it does it is a fine system. If it doesn't then it isn't big enough, and the only cure is to put in more or larger apparatus. The fact that there might be an ample supply of air, if properly applied, was rarely considered, and this haphazard method of engineering has not only led to systems unsatisfactory to owners because they did not remedy the drip and cold, and were expensive in cost and operation, but has led to systems which keep the room dry and warm, and so are entirely satisfactory, but which would not be so satisfactory if the owners realized fully the waste of heat and power that goes steadily on. We are not dealing in this article with systems which are not large enough, (and there are plenty of these), but we are dealing with systems which are too large, or which are large enough but do not produce the desired results.

We haven't the space in an article of this kind to describe instances in detail, but in one mill we investigated, and who were thoroughly pleased with their system, we found the air going to atmosphere thirty percent saturated, and they were not so pleased when they discovered they were using 1100 boiler horse power to ventilate that room, when they should have been using not over 500.

Of late years, however, it has come to be recognized that air discharged along the roof of machine rooms doesn't perform any other duty beyond carrying off the moisture. A number of years ago, the present so called vapor absorption system was developed under the Belcher—Wilson patent, and was especially applicable to machines operating without dryer felts, such as board, pulp machines, etc.

I don't think there is any question but that when a machine can be supplied with a system of nozzles on the dryers, that this is the proper method of ventilating a machine room. It has shown increased drying capacities ranging from 15 per cent. to 40 per cent., or when for any reason this is not desirable, a substantially reduced steam pressure. It also aids in uniform drying, reduces breakage about 60 per cent., eliminates wet streaks and cockle, puts more life in the sheet, resulting in better calendering, and all these advantages are secured without more cost for heat or air than if it were furnished through a roof system only. On fast running newsprint machines, book machines, etc., which have dryer felts, it is not very often that nozzles can be used and in these cases we bring the air down around the machine, partly up under the bottom felt, and partly in between the felts to approximate as far as possible the results, but without the use of cross nozzles.

No Hard and Fast Rules

There are no hard and fast rules in the design of these systems, and in every case the requirements peculiar to the individual mill must be considered. From an owner's standpoint, since it is possible to spend many times the first cost during every year of operation, it is vitally important that he be certain that these requirements have been considered, and that it is designed for the greatest economy possible in complete understanding of all the factors that enter into it. He should also have in mind when his engineer figures the steam the system will use, that if the system is properly designed, it can not possibly affect or change his total steam consumption except for the better. This is now pretty generally undersood and is occasioned by the fact that all the air which is removed from the machine room must be replaced, and it must be heated somewhere from the outside temperature to the temperature at which it leaves the ventilators. It may be heated in an adjoining room, in a separate heater, by the dryers, or by steam coils, but in every case it is heated by steam, and I think there is no question but that this air could be much more economically heated in a heater properly designed and for this specific purpose. In the old days, which by the way are not so old, a mill owner in purchasing a ventilating system, would often ask how much steam it would take, and when advised would often decide he could not afford to give that amount of steam, and would either abandon the idea or put in a smaller system. However this was (unless the system was terribly oversized), he was simply fooling himself, as he was going to use that steam and for that purpose anyhow.

It would probably be a great shock to many mills, if they were to realize that it is probably taking 40 per cent as much steam to ventilate their room as to dry their paper, yet many mills are much worse than that. Accordingly the cost of an adequate and properly designed system is a part of the cost of doing business, and should be faced with a clear understanding of what it is, and with an equal determination that it shall be as economical as possible.

The next step is the utilization of the waste vapors passing from the ventilators for the purpose of heating the air supplied to the system. This is accomplished by means of an equipment developed under the Briner patent, and which consists of alternate systems of channels, through which the vapors pass horizontally, and the fresh air vertically down, the heat being transmitted through the walls of the machine to heat an equal volume of incoming fresh air. We all know the amount of steam required to turn the water in a sheet of paper into vapor, and by cooling this vapor to below the dew-point, it condenses, thereby releasing this same heat of vaporization. In round numbers, for every pound of vapor condensed into water we obtain the heat equivalent of a pound of steam. We have hundreds of readings on a number of installations, and based upon readings in over eighty mills to determine an average temperature and humidity of vapors, we find that a rise in temperature from zero to eighty degrees then may be expected in these economizers, on practically any installation, where it is physically possible to adopt the system.

As a more or less typical instance let us take that of a mill making 85 tons, and when the conditions require that 90,000 cu. ft. per. min. pass through the machine room. In raising this volume from zero to eighty degrees, through economizers, a saving of heat units equivalent to 119 pounds of steam per minute is made. This is 7,140 pounds per hour, and at 60 cents a thousand (substitute any more accurate figure), represents a saving of $4.28 an hour, $102.82 a day, or $15,423.00 in 150 days. On a test reading at another Canadian mill, we found the fresh air entering at 30 degrees below zero, and that it was being heated to 70 degrees, representing a saving 214,840 pounds of steam on that day, and as well as the dollars and cents savings, it is usually a tremendous advantage in the very severe weather, when the boiler plant is at its peak load.

Another way to utilize the waste heat in these vapors is to draw them through sprays of water. These sprays cool and condense the vapors, and the heat released raises the tempeature of the water very considerably. Tests made by a boxboard manufacturer show that the vapors passing out of their roof would heat all of their beater water from 40 degrees to 104 degrees.

We are only at the beginning of the real work that is necessary to secure economical ventilation of machine rooms, but there have been important advances made in the past few years.

Waste in Pulp and Paper Industry

Constructive Criticism

By B. T. McBain

Assistant General Manager, Nekoosa-Edwards Paper Co.

THIS petty stuff of always finding fault with what this man or that man in the organization does or does not do, is what disorganizes business today. I presume it is nothing different than what has been going on since the beginning of the world, but that is no reason why it should continue.

One man is blamed for not doing a thing and called a Piker and when another man turns around and does for the good of the business, what the other man was blamed for not doing, then that man is called a usurper and found fault with because he did do what should have been done by someone else. Some people find fault; but do nothing themselves to help correct the faults for the mere fact of finding fault and not suggesting corrective measures, is not just criticism.

Criticism is what we all need; but it should be constructive criticism or not at all. I could find fault with the highest man in the land; but I couldn't fill his shoes and my criticism is worth nothing. I might find fault with a Superintendent and suggest measures for correction, carrying these corrective measures through to conclusion. That is constructive criticism and does some good.

The Go-Getter is always blamed for something; someone finds fault with something about him, more than anything because he is a Go-Getter; but that is no reason why the Go-Getter is guilty of the things the fault finder mentions.

Many times "We see the mote in our brothers' eye; but do not see the beam in our own eye," says the Good Book and that surely fits in with business conditions in many, if not all organizations today.

If I don't like the way the President of my employing Company handles the business, I will quit—then it is time enough to find fault with my superior officers. Until then it is up to me to carry out his policies to the best of my ability irrespective of fault finding members of the stockholders, directors, or of the minority generally.

Constructive Criticism is wanted—Fault finding, forget it.

The Editorial Page

Sift Them Down

EVERY failure of a pulp and paper company should be sifted to the bottom. If there is malfeasance or illegality it should be punished. Every person interested in the welfare of the paper industry as a whole will concur in these statements.

There have been failures at times in the past, without making any definite charge whatsoever, which have been questionable to say the least. Perhaps it would have been difficult to place the finger on the exact man to blame, but somehow, somewhere, there was the suspicion of criminality.

That is why every failure should be sifted to the very bottom. The failure of a pulp and paper company is serious enough without adding thievery to it. The losses that must be suffered, the dragging down to ruin of other firms, the impaired credit of creditors as a result of such failures, are all sufficient without the suspicion of fraud. Let the suspicion of fraud enter in and creditors writhe in their anger, and the entire credit situation is tied up as tight as a drum. When everybody has money, and everything is booming, there is plenty of credit. Let the hand of ruin fall on one or two ill fated companies and the credit situation tightens up to painful proportions in a day's time. It is a perpetual odd commentary on credit, that when you don't need any you can get all you want and when you are in dire straits, and need it badly, there is generally none to be had.

And so we claim that the entire industry should be helpful in trying to clear up obscurities about any failure. Information should be freely given. The calcium should be thrown on the sore spots. The trade should know its own worst cancers.

Turn on the light and keep it on.

Make It a Dandy

The Canadian convention in Montreal last week was a huge success. Now is the time to lay the plans for a greater success at the annual convention of the American Paper and Pulp Association in April. And with it, the exposition should not be forgotten.

We don't want to take up much space to tell you this same story again. But we don't want you to forget. So here is this week's reminder.

Short and Sweet

There will be no sad hearts in the paper industry if and when the European financial tangle is unraveled to some extent. If "Hell and Maria" Dawes and his men are successful, the German problem will have been solved. This will mean stability and in the paper market that will be of inestimable value to the paper industry of America. The amount of exports is constantly dropping.

* * *

Harold Henry, of Higgins & Henry, Chicago, has again showed his pep and ability in being chosen head of the movement to form the American Paper Stock Association. He is already president of the Chicago Paper Stock Association.

* * *

What the forestry men think of the McNary-Clark forestry bill now pending in Congress is shown in the article by J. R. Simons, in his department on "Forestry in the Paper Industry," in this issue.

* * *

Dr. Hugh Baker, secretary of the American Paper and Pulp Asociation, is touring a number of paper mills through the Middle West. We'll wager he comes back with a bagful of new ideas.

* * *

President Coolidge will never be accused of causing a paper shortage from the amount he uses in statements to the country.

* * *

It will soon be time for results of the new year to be showing.

Use of Canadian Talc in Papermaking

A Dissertation on an Important Subject as Read at the Annual Meeting of the Technical Section at Montreal

By W. C. LODGE
Division of Pulp and Paper Forest Products Laboratories of Canada

THE use of mineral filling or loading materials is common practice in the manufacture of a great many classes of paper. The function of a filler is to fill up the interstices betewen the fibers giving the smooth surface necessary for process work and half tones. It also renders the paper more opaque, improves the feel and enables it to take a better finish on calendering.

The materials commonly used are china clay, talc, asbestine, calcium sulphite, chalk and barytes, but clay is used to the largest extent.

China clay is hydrous aluminum silicate Al_2O_3, $2SiO_2$, $2H_2O$, corresponding to 46.5 per cent SiO_2, 39.5 per cent Al_2O_3 and 14 per cent H_2O and most of the commercial clays are fairly close to this formula, the most important variable being the percentage of iron oxide which amounts to as much as 2 per cent in the off color clays. The material used in the following tests was a fairly high grade clay of the following composition: —

TABLE No. 1—CHINA CLAY

SiO_2	46.70
Al_2O_3	39.50
Fe_2O_3	.37
Ca O	.56
Mg O	.15
Loss on Ignition	12.58
Residue on 100 M. Sieve	.10) Grit
Residue on 200 M. Sieve	.12) Grit

Talc is hydrous magnesium silicate (Mgo) 3 (Sio_2) 4 H_2O corresponding to 31.8 per cent Mgo, 63.5 per cent Sio_2 and 4.7 per cent H_2O. It occurs in foliated masses and has a greasy feel, a pearly, lustre, and unlike clay, which is prepared for the market by washing and settling, it is ground and graded to different degrees of fineness.

Commercial talcs show a much greater deviation from the theoretical composition than clays as the following examples show:—

TABLE No. 2—COMMERCIAL TALC

	Tyrol	St. Lawrence County New York State	Bavaria	North Carolina	Vermont	New Hampshire
SiO_2	62.12	60.59	62.35	61.35	51.20	42.43
Al_2O_3		.13	trace	4.42	5.22	6.08
Fe O	1.58	.21	1.34	1.68	8.45	13.07
M O	.....	.....	.....	.....	.32	trace
Ca O	.....	.....	.....	.82	1.17	3.27
Mg O	31.15	34.72	31.32	26.03	26.79	25.71
H_2O	4.73	3.77	4.78	5.10	6.90	8.45

Thorpe Dict. of Chem. 1913, Vol. V. P. 381.

Austria, France and Italy have until lately been the chief commercial sources of talc but of late years several deposits have been developed in North America. In Canada deposits at Madoc, Ont., have been worked for several years, the output going to the rubber and cosmetic industries and a small percentage to the paper trade. The deposits are very white in color, very soft, free from free silica, and the origin and formation have been described by Graham, (Pulp and Paper Magazine, Volume 2, 1913, Page 266.) Chemical analyses show them to be mixtures of talc, and magnesite in varying proportions, three samples on anlysis giving the following results:—

TABLE No. 3—MADOC TALC

SiO_2	48.46	48.90	48.40
Al_2O_3	.95	1.39	1.52
Fe_2O_3	.07	.08	.10
Ca O	8.97	9.71	9.22
Mg O	27.40	26.28	26.92
Loss on Ignition	14.12	13.72	13.85

These figures correspond to approximately 78 per cent of true talc, 5 per cent calcium carbonate and 5 per cent magnesium carbonate.

The residue is very different from clay screenings in that it consists of unground talc which is soft and easily crushed and not particles of silica and which is the usual reject from clay.

Formerly talc, especially that ground on this side of the water was in bad repute because of poor methods of preparation. The percentage of grit was very high and the scales or "shiners" were very noticeable on the finished sheet, but improved methods of grinding, screening and grading have eliminated these troubles to a large extent and there is no reason to believe that they cannot be removed absolutely. There is no residue on the 100 M. sieve and the residue on the 200 M. varies from .50 to 1.00 on the better grades. Some of the poorer grades run as high as 6 per cent.

It has been argued that the retention of talc is much higher than clay and that it increases the absorbency of the sheet. The following short series of tests was put through with a view to checking these claims.

Duplicate runs were made with the laboratory apparatus using both clay and talc, conditions kept as constant as possible. The pulps used were bleached sulphite, bleached soda and groundwood.

The materials were put into the beater in the following order. The sulphite pulp was beaten lightly for half an hour when the groundwood or soda was added together with the filler. The roll was then raised and the beating continued for 10 to 15 minutes when the color and size were added. Five minutes later the alum was added and the beating continued for a further five minutes, when the beater was emptied.

The stock usually stood for about two hours in the chest before running over the machine during which time it was thoroughly agitated. The speed of the paper machine was 35 to 36 ft. per minute and very little pressure was applied to the calender stack.

The papers made were fine book, cheap book, blotter and news; all which were unsized. A few runs were also made using sized stock to determine the effect of the carbonates in the talc on the alum used in sizing.

The finished sheets were allowed to stand over night. Samples cut the next day and placed in the constant humidity apparatus for three hours before testing. The average moisture at the time of testing was 7 per cent. The figures given are the average of 5 sheets each tested in five places. The retention was determined by ashing the paper, correcting for loss on ignition, etc. and results are reported using the formula:—

Ratio filler to fiber in paper = per cent.
Ratio filler to fiber in charge retention

No correction was made for the ash in fibre itself except in the case of newsprint.

TABLE No. 4—FINE BOOK PAPERS

Charge	No. 1	No. 2	No. 3
Sulphite Pulp, lbs.	30	30	30
Soda Pulp, lbs.	30	30	30
Clay	40	Talc 40	30
Alum	1.5	1.5	1.5.
Ream Weight, lbs.	66	64	64
Bursting Strength, lbs.	19.4	23.8	23.6
Per Cent Strength	29.4%	37.2%	36.8%
Per Cent Filler	22.2%	29.7%	24.5%
Per Cent Retention	42.3%	63.4%	65.0%

From the above table it will be noticed that there is a marked superiority, both in strength and retention of the talc filled sheets. The retention of the talc is 50 per cent greater and the sheets are 20 per cent. stronger in spite of the fact that they have a lower fibre content.

Test No. 3 was an attempt to make a finished sheet which contained the same per cent of filler as test No. 1.

The rolls of No. 1 and 3 were sent to the Consolidated Lithographing & Printing Co., who tried them on the offset printing machine. No dusting was observed with either but the talc-filled sheet gave a clearer impression.

TABLE No. 5—CHEAP BOOK PAPER

Change	No. 1	No. 2
Sulphite, lbs.	30	30
Groundwood, lbs.	20	20
Clay, lbs.	35	Talc 35
Ream Weight, lbs.	62.5	63
Bursting Strength	11.85	21.25
Per Cent Strength	19.0	33.6
Per Cent Filler	29.6	31.6
Per Cent Retention	60.1	66.0

Although there is not such a marked difference in the retention in this instance as in the previous case, the effect on the strength is very noticeable, so much so, that this test was duplicated with the following results:

TABLE No. 6—CHEAP BOOK PAPER

Ream Weight, lbs.	64	61
Bursting Strength, lbs.	12.5	22.8
Per Cent Strength	19.5	37.4
Per Cent Filler	29.5	31.0
Per Cent Retention	59.8	64.5

It would appear that the effect of adding groundwood to the mixture would be to increase the retention of the clay as the talc retention has remained practically the same as in sulphite soda mixtures.

Blotting Paper

Practically all the cheaper grades of blotters carry filler to a greater or less extent and it was thought that the use of wood pulp mixtures with clay and talc would show up clearly any difference in their effect on absorbency. The following furnishes were used:—

TABLE No. 7—BLOTTING PAPER

Run No.	1	2	3	5	6
Sulphite Pulp	20	20	10	10	10
Soda Pulp	40	40	50	50	50
Clay					50
Talc	40	40	50	50	
Time Beating	½ hr.	¾ hr.	½ hr.	1 hr.	1 hr.
Per Cent Filler	30.6	28.5	41.7	46.0	30.2
Per Cent Retention	65.5	71.0	85.8	94.5	51.8
Drop Test	10	5	3	4	13
Absorption. Secs. to climb ½"	69	44	28	34	90

A furnish modelled on one of these was run over a commercial machine traveling at 250 ft. per minute with results that were in very close accord with the laboratory figures. The resultant product compared very well with an all rag blotter and is practically as fast in the drop test. In the absorption test, however, the talc-filled sheet shows a decided tendency to filter out the pigment, allowing only the water to carry up beyond a certain height. Where a dilute solution of a dye was used for this test the papers behaved in very much the same way. From the above results it would appear that this is a very satisfactory furnish for blotter and is certainly superior to many of the commercial blotters, the furnishes of which are much more expensive.

Sized Stock

The presence of carbonates in the talc would naturally suggest that there might be a reaction with the alum that would interfere with the sizing operations. The effect is shown in the following table:—

TABLE No. 8—SIZE STOCK

Run No.	1	2	3	4	5	6
Sulphite Pulp, lbs.	30	30	30	30	30	30
Soda Pulp, lbs.	30	30	30	30	30	30
Clay, lbs.	40				40	
Talc, lbs.		40	40	40		40
Rosin, lbs. (as size)	1.05	1.05	1.05	1.05	2.00	2.00
Sulphuric Acid			6			
Alum, lbs.	2	2	1½	4	4	5
Ream Weight, lbs.	58	58	66	66	66	68
Bursting Strength	15.4	9.5	16.6	16.6	7.0	8.5
Per Cent Strength	26.6	16.4	24.5	25.2	10.6	12.5
Per Cent Filler	30	28	38.6	32.5	29.5	35.0
Per Cent Retention	65	59	70	72	63	81
Per Cent Rosin	65	1.04	.96	.94	1.97	2.00

It will be seen that the addition of a little more alum corrected the action of the carbonates entirely. It would appear that the alum-rosin size reaction proceeds much faster than the alum-calcium carbonate reaction.

In no case was there sufficient foaming to cause difficulty on the paper machine. Of the two clay seemed to give a little more trouble.

News Print

The marked difference between the strength of the talc-filled sheets and those loaded with clay suggested that the usual weakening effect of a filler might not be so pronounced with talc and it appeared feasible that it might be used in newsprint to advantage. Three tests were made as follows:—

TABLE No. 9—NEWSPRINT

Furnish	No. 1	2	3
Sulphite, lbs.	12	12	12
Groundwood, lbs.	48	48	48
Clay, lbs.		6	
Talc			6
Alum	1	1	1
Ream Weight, lbs.	32	34	32
Bursting Strength	11.0	11.0	14.2
Per Cent Strength	36.0	32.4	44.0
Per Cent Filler		8.2	8.7
Retention		89%	95%

One of these, No. 3, was super-calendered with excellent results, the finished sheet comparing favorably with ordinary rotogravure stock. These figures were confirmed in subsequent runs and it was arranged to have a trial made on a commercial machine.

Six rolls were made up with the intention of making paper carrying 4 per cent and 6 per cent and 8 per cent of talc but through some misunderstanding they came out 2 per cent, 3 percent and 4 per cent. The furnish was a mixture of 27 per cent sulphite and 73 per cent groundwood, and samples taken at the apron and from the finished sheets were tested, the results being given below.

The talc was added dry, direct into the mixing chest and mixed thoroughly for about twenty-five minutes before the stock was run over the machine. There was no trouble in getting the stock over the wire; the only noticeable difference was the fact that the suction was increased some two inches as there was a tendency of the stock to "skip" to the third suction box. The rolls were made without any breaks.

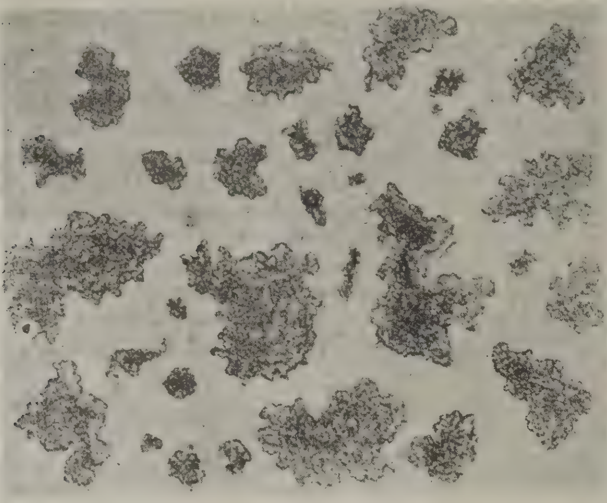

Fig. 1.—Clay

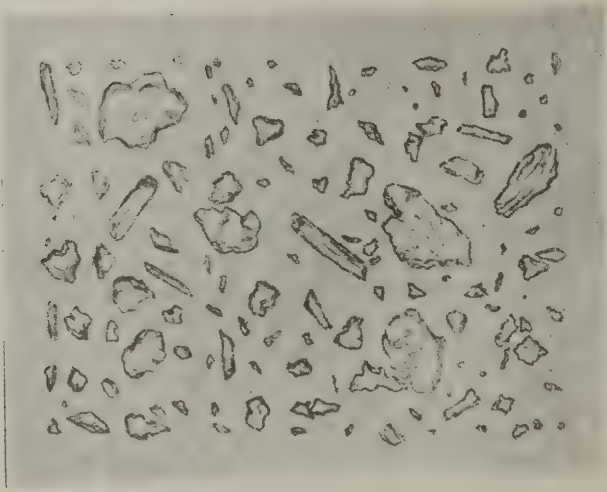

Fig. 2.—Talc

Table No. 10—Newsprint

Run No.	1	2	3
Filler charged	8.0%	6.0%	4%
Filler at Apron	5.6	3.98	2.66
Filler in Finished Sheet	3.94	3.26	2.40
Per Cent Retention (based on % at Apron)	68%	81%	90%
Ream Weight	31.5	33.0	34.0
Bursting Strength	10.8	10.7	10.7
Per Cent Strength	34.0	32.5	31.4

Through the courtesy of the Montreal Star these rolls were run over their presses. The press was set up so that 32 of the 84 pages of the issue would be printed on the talc-filled paper. This gave 27,000 continuous impressions on the talc-filled stock 28 of the pages printed satisfactorily throughout, in fact, some of the impressions towards the end of the run are superior to those made on ordinary newsprint. On the remaining four, however, the type smeared badly at about half way through the run and this condition grew steadily worse as no attempt was made to correct it by cleaning up the type. It is noteworthy that the greatest trouble occurred on the sheet carrying the lowest percentage of filler.

Even in these sheets that did fail the failure was confined to two or three parts of the page and not spread over the whole area. The failures occur only in the rotographic section, and the writer failed to find a single instance of any of the printing type being clogged. It does not seem reasonable to ascribe the trouble to the talc and it is planned to have the test repeated in the near future.

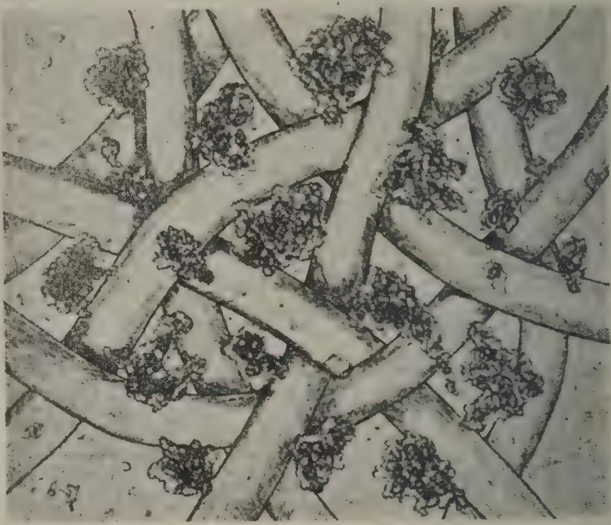

Fig. 3.—Clay with fibres

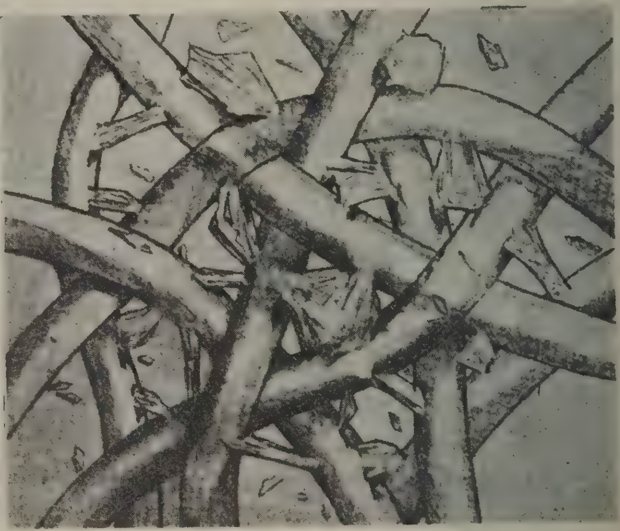

Fig. 4.—Talc with fibres

Talc and clay are, of course, very different materials. Clay is amorphous (Figure 1) talc crystalline (Figure 2) and this difference accounts for many of the variations between sheets made with these two fillers.

Clay presents no edges or corners to the fibres (Figure 3), acting more as a solid lubricant, hence its weakening action on the strength of the sheet. Talc on the other hand (Figure 4), tends to lock in the spaces, the corners of the crystal press into the sides of the fibres and so resist the tendency to slip against one another when the sheet is torn or pulled apart.

The amorphous nature and fineness of the clay tends to fill up the interstices of the sheet more completely and so clog them, decreasing the absorbent power, while talc being both coarser and crystalline actually increases the number of capillary spaces.

It is apparent that the greater retention value of talc is also due to these features.

Summary

(1) From the laboratory tests described, it would appear that talc has a much higher retention value than

clay and that this tendency is more pronounced with chemical than groundwood pulps.

(2) It would appear that talc has a positive influence on the strength of the sheet and that this endency is more pronounced wih groundwood than with chemical pulp mixtures.

(3) It would appear that talc is much superior to clay in blotting furnishes.

(4) It has also been shown that the effect of the carbonates of Canadian Talc on the sizing process is almost negligible.

(5) The difference between talc and clay is a function of the size and shape of the particles.

Laboratory tests are, of course, comparative but not conclusive; it may be pointed out that the formation on a machine traveling at 30 to 40 feet per minute is necessarily better than that obtainable on a high speed machine.

What little work has been done on commercial machines, however, tends to corrobate to some degree the laboratory results both as regards retention and increased strength.

The question of the influence of talc on printing, i.e., the tendency to clog the type is not yet answered, the results so far would incline one to believe it does not interfere but a long series of tests would be necessary to establish this point.

Should this be the case, and the results above given be confirmed on commercial machines, considerable economy can be effected, both in the substitution of talc for clay (the former being cheaper in first cost and having a higher retention value) and also by the introduction of talc newsprint. If this latter can be developed it might prove of considerable value in reducing materially the drain on our pulpwood supply.

The writer gratefully acknowledges the assistance of the Consolidated Lithographing and Printing Company, the Howard Smith Paper Mills, the Belgo-Canadan Paper Company, the Montreal Star and the Asbestos Pulp Company of Madoc.

Plantation Pulp

We shall be interested to obtain the name of the pulp and paper company which the Forest Service announces this week as having established plantations of cottonwood on the Scioto River bottomlands in Ohio. The purpose of the plantations is to provide for an assured supply of raw material for the company's mills.

Very little of the old stand is left in this region, and most of the old growth is on ridges and is of poor quality. The company is considering the purchase of hill land and the extention of its holdings in the bottomland to secure a crop of second-growth timber.

E. F. McCarthy of the Appalachian Forest Experiment Station visited the region recently and reports that the second growth in all the hill counties about Chillicothe, Ohio, is in a thrifty and productive condition. The owners are well aware of the value of their timberlands and look for periodic returns from ties, locust and sassafras posts, as well as a constant supply of pulpwood for the paper plant.

New Brand Names

Applications for registration of the following brand names have been made in the Toilet Paper Label Registration Bureau of the Tissue Paper Manufacture Association:

From December 20, 1923, to and including January 20, 1924.

Blue Duck—Fisher Bros. Paper Co., Fort Wayne, Ind.; Blue Rose—Fort Howard Paper Co., Green Bay, Wis.; Busy Bee—Gotham Tissue Corporation, New York, N. Y., (Taxin & Shapiro); California—Blake, Moffitt & Towne, San Francisco, Cal.; Dandelion—Ajax Paper Mills, New York, N. Y.; Try the Drug Store First—A. R. Rapp Co., Chicago, Ill.

The following brand names have been registered in the Toilet Paper Label Registration Bureau of the Tissue Paper Manufacturers Association by the Fort Howard Paper Company of Green Bay, Wis.

From December 20, 1923, to and including January 20, 1924.

Evanglo, Farabuv, Lady Luck, No. 26, Numark, Nu-Star, Our Seal, Pride of the Woods, Pull One, Selfelp, Sunglo, Vapordu, Wiplot.

Waterproofing Paper

A new process for waterproofing paper is described in *The World's Paper Trade Review.* The waterproofing is effected by the precipitation of a size which is added direct to the beater on the fibers of the paper. The precipitating agent used in the process is alum. The size consists of an emulsion of a bitumen, fat, wax or mineral oil in a solution of rosin soap. Protective colloids such as glue, gelatine, starch and the like are also added to this mass. Besides a condensing or polymerizing agent, such as formaldehyde, tannic acid, chromic and the like are also employed. The purpose of these substances is to polymerize the rosin, partially oxidizing the mineral wax and hardening the fiber.

For example to a size containing sodium resinate at a temperature of 70 degrees C, there is added one third of a pint of paraffin wax which has a melting point of from 40 to 50 degrees C. The mixture is then emulsified, eight to ten per cent (calculated on the weight of the rosin) of a forty per cent solution of formaldehyde is added and the mixture is agitated until it attains the desired properties. Gelatine (one to two per cent calculated on the weight of the water present) may be added for the purpose of retarding the subsequent precipitation with alum.

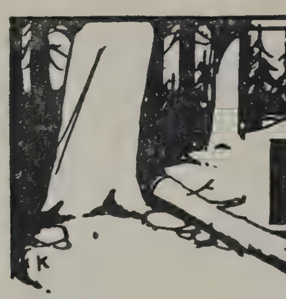
The resulting size is added to the beater and the paper pulp is maintained at a temperature of from 45 to 50 degrees C until the couch roll is reached.

Feeding Pulp Digesters

The material that is to be digested is first pressed together to form cakes in a suitable press. A binding agent may or may not be added. The briquettes are then filled directly into the digester and are disintegrated by the digestion process. If the press cakes are very moist and easily separated into fibers or if this condition is attained by a preliminary treatment with steam, then a binding agent need not be used. Otherwise a binding agent should be used. This process is patented in German Patent No. 385,225.

Manufacture of Coated Paper

It is known that unglazed paper has been used for making transfer paper by first covering the former with a coating. According to the process that is patented in British Patent No. 205,119, unsized or only slightly sized paper is employed for coating with heavy insoluble colors, including colored or white pigments, for example for photographic printing paper, for lithography and metal and colored papers. The paper is heated to facilitate the penetration of the size so that only sufficient size or glue solution remains on the surface of the paper as is required to fix the coloring matter. The paper may be led over a heat plate or drum immediately after the coating operation when the paper becomes more capable of absorbing the size which cannot solidify at once. The paper may be heated prior to the coating process. The coating may be effected either on a coating machine or on an emulsion machine. The process is applicable to the manufacture of novel coated papers.



NEWS FROM CANADA

WATCH OUT FOR THIS KIND OF MAN

Collects the Money from Workers and Then Departs With It

RECENTLY, there appeared in eastern Canada, an individual who announced he was an organizer for the international pulp and paper workers union. He arranged a number of organization meetings, which were attended by some employees of pulp and paper mills in the various eastern Canadian centers. Although the man announced his name as Labelle, it has been found he has also traveled under other names. He collected nearly a thousand dollars in initiation fees, and nothing has since been heard of him.

In citing this instance, it is remarked by such well known figures in the pulp and paper industry in eastern Canada, as Angus McLean, president of the Bathurst Company, that practically all of the trouble between employees and employers insofar as the pulp and paper mills and woods operations are concerned has been created by outside labor organizers. That many of the labor leaders are exploiting the workers does not seem to be realized by some of the workers, although the tendency is toward this impression by the bulk of workers. The ease with which Labelle disappeared with nearly a thousand dollars, is an instance of the gullibility of some of the pulp and paper mill employees. Labelle had appealed to the men to pay him the fees on the assumption he would secure for them an increase in wages, and a reduction in hours.

Every strike that has taken place in eastern Canadian pulp and paper mills as well as in the pulpwood cutting operations in the woods can find origin in an outside labor leader. Practically all of the strikes have been very disastrous from the standpoint of the employees, and the workers are now loath to participate in strikes. The most recent strike was that declared on the Nashwaak Pulp and Paper Company of St. Johns, N. B. After a protracted period of idleness, the employees returned to work, on about the same conditions that had been prevailing, prior to the opening of the strike. This strike had been ordered by outside organizers who failed to achieve their objective, with the result that outside organizers are not welcome with the employees of this company.

Broke All Records

The Spanish River Pulp and Paper Mills, Limited, head office Toronto, and mills at Sault Ste. Marie, Espanola and Sturgeon Falls, Ont., broke all records for production of newsprint during 1923. Production at the three mills totalled 236,359 tons. This figure compares with 197,116 tons in 1922 and 172,231 tons in 1920. In 1921, when a strike occurred, newsprint production at the mills went down to 139,412 tons.

* * *

A Little Fire

A slight fire took place at King Division of the Allied Paper Mills, on January 16th. The oil dripping down from the super calenders, caught fire, in the basement, and with one puff, reached the floor above. The damage was slight.

Ridiculous Prices

Angus McLean, the widely known lumber and pulpwood operator of Bathurst, who was in Toronto a few days ago, says it is a little early yet to size up the 1924 situation in connection with the pulp and lumber market. He said, however, that there were very large quantities of foreign pulp coming to the American market from the Scandinavian countries and being sold at ridiculous prices, so that the Canadian manufacturers are really operating at a loss and, in trying to meet this competition, are operating below cost. If this continues, he says, there is no future whatever for the pulp business and conditions for 1924 look anything but hopeful. He stressed the fact that the only hope for the lumber industry in the Maritime Provinces today is a policy of material lowering in the cost of production so that the products can be sold to meet the foreign competition and still make a profit.

* * *

Annual Banquet Is Jolly

Over a hundred representatives of the Espanola, Sault Ste. Marie and Sturgeon Falls mills of the Spanish River Pulp and Paper Mills, Limited, sat down at the annual banquet of the company at Sault Ste. Marie, Ont., January 19. President George H. Mead came from Dayton, Ohio, and he was accompanied by W. N. Hurlburt, R. T. Houk, Jr., J. G. Sutherland, H. Conway, Alex Creighton and R. W. Worrell. J. G. Gibson, secretary, was the only representative from Toronto. In addition to the heads of departments, engineers, foremen and executives of the various mills, a number of civic officials were guests of the company and the program included a speech by Hon. Charles McCrae, Minister of Mines, in the Ontario Government.

The new pulp and paper school at Three Rivers, Que., was formally opened a few days ago with an enrollment of fifteen day and twenty evening pupils. This school, it is expected, will furnish skilled labor from the citizens of Three Rivers district where up to the present it has been necessary to import this class of help.

* * *

Make Contracts Individually

As the plan for co-operation with the University of Michigan as a unit, all the mills going in, has fallen through, the mills are making up their contracts with the U. of M. individually. While the Bryant firm has hired an outsider to take charge of their extension work. H. C. Fleischer, of Aschafferburg, Germany, has taken up his work here. He is a Doctor of Chemistry, and, before coming to the Bryant Paper Co. has had charge of the chemistry department of The Paper & Pulp Co. of Aschaggenburg, Germany. This concern operates seven mills there. He states that felts last a great deal longer in this country than they do over there, the average life of a felt there is one week, while here it is three. He also states that he is here to bring ideas from the old world into the new, and try to work out economies in operation, like they do in Germany.

* * *

Sheldon E. Wardwell has been elected a director of the Great Northern Paper Co., Madison and Millinockett, Maine. He will succeed the late Col. Haskell, Newton, Mass.

MATTAGAMI EXPECTED TO CONTINUE

Ask for Deposit of Bonds With National Trust Company

A BONDHOLDER'S committee of the Mattagami Pulp and Paper Company, Limited, head office Toronto, has been formed and a letter sent to shareholders asking them to deposit their bonds with the National Trust Company. According to the letter the receiver has liquidated a loan to the bank of approximately $39,000 made so that operations could be continued. About May, 1923, the pulp and pulpwood was exhausted and liquidated and since then the receiver has been carrying on operations. The receiver now holds funds of the bank arising from the operations up to May, 1923, and amounting to $200,000, and has also obtained permission of the court for the issuance of receiver's certificates to the amount of $425,000, ranking in priority to the bonds, for the purpose of securing additional pulpwood to maintain the operations without a break and for capital expenditure on plant.

Various court orders have been made authorizing the receiver to make expenditures totalling approximately $200,000. Some of these expenditures were directed to be charged to operations and some to capital, the result being that the value of the plant and equipment has been increased by approximately $135,000. The money so expended has been paid out of operations and the realization of wasting assets such as supplies, etc. Since May, 1923, the operations of the receiver have resulted in profits of approximately $100,000 and in addition stumpage has been provided at the rate of $2 per cord for all wood cut by the receiver on the company's limits. The receiver states that the plant of the company has been well maintained, and is at present operating at higher efficiency than at any time since the company went into liquidation. He has advised the committee that the wood now on hand, or contracted for, will be exhausted during the coming spring or summer and that when that point is reached it will be necessary to shut down unless further arrangements are made for an additional supply of pulp. The company still retains large areas of pulpwood limits which it held when the bonds were issued but funds will be required to cut wood or contract for it and deliver it to the mills. The receiver is asking for authority to borrow $1,500,000.

Canadian Briefs

Barnjum Makes Pledge

Concluding an address before the Society of Forest Engineers in Montreal in which he reiterated his long-continued advocacy of an embargo on Canadian pulpwood exports, F. J. D. Barnjum, the noted conservationist and Canadian lumberman gave the following "definite and serious" pledge: "If the heads of Canada's three largest banking institutions will select an unbiased and acceptable committee of three men of good judgment whom I cannot convince that Canada's entire available wood supply will become exhausted within a period of less than ten years, unless drastic and immediate measures are taken to prevent such a calamity, I will agree never to mention forest conservation in Canada again."

* * *

Increase Borrowing Powers

The borrowing powers of the Whalen Pulp and Paper Company, the British Columbia concern which recently went into the hands of a receiver, have been increased by the courts from $600,000 to $800,000. Most of the $600,000 which had been borrowed by E. F. Giles, predecessor to Mr. Mills, who was appointed Dec. 7, had been used up, according to the solicitor for the bond holders. Wages, taxes and similar claims, have required $353,833; insurance $60,000, and it had been necessary to redeem $65,000 bonds of the B. C. Sulphite Fibre Company. This left $112,000 for working capital. Available assets totalled $838,675, and included $319,000 of pulp and lumber, $80,000 of logs and $429,000 of general material and supplies. It was explained that the Bank of Nova Scotia would advance an additional $200,000.

Heard Good Talks

At a meeting of the Toronto Carton Club last week, to which were invited members of the Canadian Paper Box Manufacturers' Association, members of the trade were present from Hamilton, Galt, Guelph, Stratford and Peterboro. Brief talks were given by the members on "Viewing the Year 1924 and on a vote of those present Don Porter of the Rudd Paper Box Company was awarded the box of cigars awarded by the secretary for the best presentation of the case, with Mr. Green, of the Dominion Paper Company running a close second. The members took an optimistic view of conditions in the paper box industry both as to the present and the future. A committee was appointed to look into the matter of fire insurance rating of the paper box factories and to report at the next meeting. This pledge was signed: "That during the course of the year 1924 we shall be guided, in quoting prices, by the thought that a fair margin of profit on all sales is essential to the welfare of our business and the paper box industry as a whole."

* * *

New Company Formed

With a capital of $2,000,000 and head office in Montreal, the incorporation is announced in the current issue of the Quebec Official Gazette, of the Cape Magdalen Pulp and Lumber Company, Limited. The original incorporators are F. B. Common, L. H. Ballantyne, Charles R. McKenzie, F. G. Bush and W. P. Creagh. The new pulp company is granted the usual powers to carry on business of manufacturers of pulp and paper.

PORTLAND COMPANY VISIT WISCONSIN MILLS

President and General Manager of New Mill on a Splendid Trip

E. H. MILLS, President and Mr. Joseph Kaster, Manager of the newly organized pulp and paper Company of Portland, Oregon, known as Portland Pulp and Paper Company visited the different mills of the Nekoosa Edwards Paper Company at Port Edwards and Nekoosa, Wisconsin on Wednesday, January 23rd, and inspected the two mills of the Consolidated Water Power and Paper Company at Wisconsin Rapids and Biron, Wisconsin, on Thursday the 24th.

The building of the new mill at Portland, Oregon, will be commenced early in the spring and will require approximately a year to get the work completed. This mill will be of concrete and re-inforced steel construction and is to be equipped with modern machinery for the manufacture of Kraft paper. Slabwood lumber from the Monarch Lumber Company's mill will be used to make the kraft paper. Mr. Mills and Mr. Kaster are now on their eastern trip in the interests of their new industry and are buying the necessary machinery with which to equip their new plant which will be located adjoining the Monarch Lumber Company's mills at Portland, Oregon.

Mr. Kaster had been associated with Mr. B. T. McBain for a number of years while they were with the Crown Willamette Paper Company of Washington and Oregon and he made it a special point to look up Mr. McBain to renew acquaintance and to go over the mills of the Nekoosa Edwards Paper Company. Another old associate of Mr. Kaster was Mr. C. A. Wiley, general paper mill superintendent of the Nekoosa Edwards Paper Co. as these two men were machine tenders together some thirty-five years ago in Indiana, friendships thus being renewed also.

Mr. Joseph Kaster was the organizer and first manager of the Oregon Pulp and Paper Company at Salem, Oregon, which now operates a three machine paper mill together with the necessary auxiliary mills for the various grades of pulps.

Mr. Mills has for a number of years been associated with the lumber business as part of the Spaulding Logging Co. of Salem, Oregon.

* * *

To Retire Bonds

A call for the retirement of $60,000 in bonds will be issued at once by the Sutherland Paper Company following action taken at the annual meeting here. The bonds are part of an original issue for $300,000 dated March 1, 1920, and bearing interest at seven per cent. More than $50,000 already has been retired. The bonds involved in the new retirement include the entire issue for 1924 and the first part of 1925. All the officers and directors were re-elected as follows:

President, L. W. Sutherland; vice president, O. F. Miller; secretary, F. W. Sutherland; treasurer, Walter Otis; and directors, the officers, and Frank B. Eilers, F. M. Hodge, Fred Appeldoorn, Edmond W. Chase, and A. M. Meincke.

* * *

Next Meeting February 21

The next meeting of the Superintendents' Association will be held February 21 at the Park-American Hotel. At this meeting, Edgar Rhoads, of the J. E. Rhoads & Sons, makers of Rhoads Leather Belting and Lace Leather, will speak.

New York Trade Notes

Durham Company Bankrupt

An involuntary petition in bankruptcy was filed on January 25 against the Durham Paper and Pulp Company, with offices at 17 East Forty-second Street, New York, by these creditors: Bulkley, Dunn & Co., creditor for $25,000; H. Hollesen, Inc., $25,000, and the State Bank, $10,0 and Judge Frank Winslow appointed Charles A. Marshall receiver under $10,000 bond. The company operates paper and pulp mills at Durham, Pa.; Forresport, Hadley and Napanock, N. Y.; Seymour, Conn., and Rising Sun, Md., the principal output of which is kraft paper. Heavy losses sustained recently in the operation of these mills and the alleged wrongful seizure of the Hadley plant, which resulted in that mill being temporarily closed, were given as the cause of the failure of the company, which admitted its willingness to be adjudged bankrupt. No statement was made concerning the company's liabilities and assets, but in an equity action last November Charles R. McNair was appointed receiver and at that time it was said the liabilities exceeded $1,000,000 and the book value of the assets was listed at $2,000,000. This receivership was subsequently vacated.

* * *

The Shuttleworth-Drake Company, jobbers in paper and paper bags of 220 West Broadway, New York, has filed notice of a change in name to Clarence V. Shuttleworth.

* * *

The Stevens Paper Company, Inc., has moved to the Metropolitan Life Insurance Building, 1 Madison Avenue, New York, where an attractive suite of offices on the thirty-ninth floor is occupied. The company represents the Rhinelander Paper Company, of Rhinelander, Wis.; the Paper Novelty Company, of Green Bay, Wis., and the Tuttle Press Company, of Appleton, Wis., the agency for the specialty business of the last-named concern having just been acquired.

* * *

Nathan Leshner, of the Leshner Paper Stock Company, Inc., Lockland, O., and I. Klous, of the Stone Bros. & Victor Galaup Company, 153 Spring Street, New York, both of which companies are large importers of papermaking rags, returned on the steamship Aquitania, January 23, from business trips to Europe.

* * *

Robert Reed, formerly sales representative in the Ohio territory for the American Woodpulp Corporation, of New York, is now a member of the sales force of the wood pulp department of the Perkins-Goodwin Company, of the Aeolian Building, New York.

* * *

The Bronx Pioneer Waste Paper Corporation, of New York City, was incorporated under New York State laws at Albany several days ago to pack and deal in waste paper with a capital of $20,000. D. A. and T. and K. Galante were the incorporators.

* * *

The waste paper and papermaking rag department of Atterbury & McKelvey, of 145 Nassau Street, New York, is now under the management of Andrew Ragone, who is president of the Andrew Ragone Company, Inc., of James Slip, New York, and who has been identified with the old paper trade for a good many years.

FORESTRY in the PAPER INDUSTRY

Conducted by J. R. Simmons, Secretary Forester, the New York State Forestry Association

MIX AND BAKE IN A QUICK OVEN—CONGRESSMAN CLARKE OFFERS PRACTICAL RECIPE

Various Phases of Forestry Taken Up at Annuel Banquet of Forestry Association

THE McNary-Clarke forestry bills now pending in Congress were the chief subject of discussion at the annual banquet of the American Forestry Association in New York January 23, by Senator Moses, member of the Senate committee of which Senator McNary was chairman, and Congressman John D. Clarke, who introduced the committee bill in the lower house.

Mr. Clarke prefaced his discussion of general forestry problems with this recipe for forestry:

“Take ninety-six United States Senators and 435 members of Congress. Mix well with pictures of the denuded hills of China and its population with the lowest standards of living. Add a panoramic view of our now fast disappearing forests, due to the absence of a national forestry policy. Place into the mixture the leaven of an aroused public conscience, demanding a national forestry policy adequate to the requirements of the United States. Knead into six loaves, embodying the following points based on reciprocal laws and the co-operation of each of the states with the federal government:—

1. More funds for patrol and lookout stations to prevent and put out forest fires.

“2. Just forest taxation laws to encourage private owners to grow trees.

“3. Substantial additions to the already existing areas of public-owned forest lands.

“4. More assistance to the private forest owner, both in aiding reforestation and in the proper management of existing woodland.

“5. Adequate appropriation for investigation and research work in order to utilize and get the most out of our forests.

“6. Permission for owners of private forest land who actively co-operate with the government, to deduce a certain percentage from their income tax returns, on the same principle as is now followed where the individual makes charitable contributions.

“Repeat the same process with the legislatures in each of the forested states.

“Bake quickly.

“Result: Forty-eight states co-operating with the Federal Government, and the children of all the tomorrows singing the praises of those who joined in accomplishing this long desired end.”

Mr. Clarke then proceeded to analyze the forestry problem, emphasizing the need for co-operation between federal and state governments and the private owner, saying in part:

“In discussing a national policy, the states must realize that they have a definite responsibility which cannot be shifted. That responsibility is the duty of going forward, each state in its own little way, with a policy based on the sovereign law of that state to encourage reforestation. If you want a program, here is one:

“A Real Definite Survey of the State,

“1. To ascertain the extent of lands more suitable for reforestation than for agriculture.

“2. An exact, scientific determination of the kind of trees those lands will best grow in the light of that survey and the needs of the state.

“3. Getting going with a plan of growing and distributing the needed trees.

“4. Proper tax laws that will make certain that our public-spirited citizen will not be penalized for making wood lots and idle lands productive.

“5. Proper protection from fire and the enemies of trees.

“My own state of New York has been working splendidly on this program and presents a picture that points the way to what each of the states can do, but it is only part of the story, for, with the best efforts of the 48 separate states there must be the heartiest co-operation of the Federal Government itself, or else our real good will not be achieved. Co-operation is the watchword, and it finds itself in part expressed in the bill introduced by Senator McNary in the Senate, and by myself, at the Senator's solicitation, in the House of Representatives. This Bill, if enacted into law, represents a great forward step in reforestation that needs the support of this influential association, not that it meets either your or my full wishes, but for God's sake let's get going somewhere.”

REGULATION ON PRIVATE TIMBER LAND

State Senator Rabenold Will Discuss This Question Before American Foresters

STATE Senator Rabenold, of New York, will be one of the speakers on the annual program of the New York Section, American Society of Foresters, discussing the regulation of cutting on private land, and having asked the timberland owners for suggestions and plans, he now requests that the foresters join with him in the formulation of some proper legislation on this point. As a result, the meeting of the Section which will be held at Albany, February 6, will be more than ordinarily important in its relation to actual forestry practice in New York State. Senator Rabenold is chairman of the state senate reforestation committee, and he wants the state's foresters to draft a forestry law which would bring about better forest management on a large scale. Those who are to attend are being asked to be ready with suggestions for such a law.

The entire program is involved closely with the problems of the paper industry, and H. S. Churchill will have a paper on the subject of “What Constitutes a Practical Working Plan for a Lumber or Pulp Company in the Adirondacks.”

The New York State Forestry Association's convention will be held the day previous, and will be devoted to a program of rather more popular type than that of the forest engineers on February 6. The Forestry Association is bending its energies toward developing, at the annual meeting, a basis for economic forest taxation. So much interest has been manifested in the program of February 5 and 6 that the General Electric Company at Schenectady has arranged to broadcast some of the leading addresses. WGY promises a radio audience of half a million for this occasion. We do not as yet know what results for forestry might be derived from radio broadcasting, but this undertaking at Albany should arouse constructive thought over a wide area and yield some results in obtaining the policies that are needed.

DECAY IN DOUGLAS FIR LAMENTED

One of the Most Important Timber Trees in Pacific Northwest Stricken

DOUGLAS fir is the most important timber tree in the Pacific Northwest and comprises nearly one-fourth of the merchantable timber of the United States. Because it is very susceptible to disease caused by four fungi which are responsible for great loss to owners of over-mature timber, an investigation was made some time ago by the United States Department of Agriculture. This was to determine the extent of such damage and to formulate methods for more accurate estimation of the amount of defective timber. At the present time, estimates on Douglas fir stands are commonly very inexact, and often result in heavy financial losses and costly litigation.

Timberland owners in the Douglas fir region may be interested to know that the investigations thus far made have been published in Government bulletin 1163, entitled, “A Study of Decay in Douglas Fir in the Pacific Northwest.” This is obtainable from the Department of Agriculture at Washington, D. C.

Mechanical injuries are of little importance in relation to the entrance of decay. Knots are responsible for nearly ninety per cent of the volume of all decay in the trees studied. Fire scars are the entrance point for four per cent. and the remaining six per cent come in through other scars. Fire is the only controllable factor, so there can be bus little reduction in the extent of decay in future stands by by a reduction in the scars caused by controllable mechanical injuries.

It is a well established fact that young stands or second growth are relatively immune from decay, but it is not yet determined at what age in the life of the stand this immunity ceases and the trees become subject to extensive decay. Establishment of this age will enable timber men in the future to cut stands before there is any real loss and at the same time permit the trees to attain the maximum size.

THE SIX FOOT SPACING IDEA

Principle Is Explained for Paper and Pulp Mill Executives

IN its January bulletin, the New York State Forestry Association explains to its members the principle involved in the close spacing of trees in the forest plantation, and illustrates these principles with a photograph of a white pine whose trunk is perfectly clear of limbs for nearly 150 feet. The following is quoted from the main body of the article:

"The United States foresters who estimate timber in the national forests of the West tell us that it requires "three looks" before the eye reaches the top of the average sized redwood, Douglas fir or Sitka spruce. In the East we are accustomed to scan the average conifer at one glance; but occasionally, as in the virgin forests of the Adirondacks, we encounter trees running well over one hundred feet. These trees have clean, straight boles and will often produce a thousand board feet of lumber.

"The remarkably clean stick of timber which is selected to tell the story suggests a brief investigation into the methods of producing successful forest plantations.

"Trees in the natural state meet with severe competition on all sides and only those that can keep their terminal shoot to the light will win out. Those that survive have "cleaned" themselves by opposing their lateral branches against the perpetual whipping and crowding of neighboring trees, until at maturity they become refined to the point of perfection in standing timber.

We try to reproduce, in reforestation, these natural competitive conditions. Hence, trees are usually planted six feet apart each way—1210 trees to the acre. A thousand trees to the acre are sufficient to produce the desired results. At twenty years it is desirable to thin out the suppressed trees. It is not necessary nor especially advisable to trim off the lateral branches. If, however, these are dead and brittle they can be knocked off in winter to permit of better recreational use of the plantation.

The final stand will be no greater than in the natural grown forest. In planting our trees close together we merely follow the rules already suggested by Nature; but we assist nature by providing a more even distribution of the planting stock and by thinning out at regular intervals the trees which she would otherwise kill off in her own slow but sure way."

* * *

To Establish Factory

The Planters Nut & Chocolate Co., Suffolk, Va., will establish a factory for the manufacture of paper boxes and glassine bags. The plant, which will also house the chocolate factory, will be 100x325 feet, six stories high. The first unit will be completed by June 1 and the last one about the end of the year.

What do you do with the time you save each day?—*Tree to Trade.*

A LAUGH A WEEK

A Good Joke On a Paper Trade Man

$5.00 for Each One Used

THIS WEEK'S WINNER

By R. H. ROGERS

Industrial Engineering Dept.
General Electric Company,
Schenectady

"Red" second hand up in the Otis Mill could make paper but he couldn't read anything printed on it. He was a great fight fan and attended every "mill" that he could get to. Some of the boys ran across a two year old paper outlining a big fight, showed "Red" the pictures and sold him a ring side seat for five dollars.

On the appointed night, "Red" stood around the entrance alone for two hours with it 22 below, then went to a nearby "chemist" friend who told him that the fight he was waiting to see had taken place two years before.

"Red" staged one of his own when he met the scheming shift coming out of the mill gate.

Business Opportunities

The Purchasing Agent, Government Printing Office, Washington, D. C., will take bids until Feb. 6, for two book sewing machines, as per specifications on file.

The Bureau of Foreign and Domestic Commerce, Washington, D. C., has information regarding a company at Coblenz, Germany, in the market for a quantity of cartons and wax paper, Reference No. 8913. Also, of a concern at Vienna, Austria, desiring to purchase American printing and lithographing machines, No. 8914; of a company at Leeds, England, in the market for a quantity of wall paper, No. 8798; and a concern at Montevideo, Uruguay, desiring to purchase about 75,000 pounds of writing and printing papers, Reference No. 8898.

* * *

Government Paper Mill Projected on Pacific Coast

Representative John E. Raker, California, has introduced a bill in the House of Representatives, Washington, D. C. (H. R. 114) authorizing the public printer to provide for the construction of pulp and paper mill or mills for the manufacture of print paper for Government service, such plant or plants to be located on the Pacific Coast, with initial daily output of not less than 50 tons per day.

What They Say:

The Matter of Poplar

Editor PAPER:

Considerable ink is now being used in the paper trade journals discussing conservation of timber, but I note that no one is willing to forget their selfishness or make any temporary sacrifice to solve this problem.

I have in mind the use of poplar in the manufacturing of newspaper and similar grades of paper. We all know that a good sheet of newspaper can be made that contains as high as 25 per cent of poplar groundwood. A few mills making news use a small amount. Northern Wisconsin and Michigan and a great many other states are filled with poplar which is now a detriment to the settler. In Wisconsin alone, about 300,000 cords of spruce move to the mills each year for paper. Over 75 per cent goes into news. If 25 per cent of poplar was used, there would be a saving of over 50,000 cords of spruce in one state alone.

In the last session of the Wisconsin Legislature a bill was introduced making it compulsory to use 15 per cent of poplar in newspaper and similar grades. But, what happened? Some day when this thing is opened up by someone with sufficient nerve, it will make interesting reading, and selfishness and disloyalty to our future resources will be exposed.

I am not signing my name to this article for I think too much of some of my selfish friends to get "in wrong" with them but I am looking forward to the time when someone will stir the matter up and secure Federal and State Legislation before it is too late.

OBSERVER.

* * *

Fire Damage Diminishing

The fire demon was kept at bay in the western forests during the year 1923, according to the report of E. T. Allen, forester of the National Lumber Manufacturers Association, and the Western Forestry and Conservation Association. Great areas were swept in the five Pacific coast states of the Western Association's field, but the damage to standing timber was less than usual partially because of improved methods of forest fire control. Fires in the south and lake states were more destructive of potential forests than of standing timber. Human carelessness was the chief cause of all fires last year. Man-caused fires ran as high as 90 per cent of the country's total, and 60 per cent of the losses in the far west. The burden of expense in fire control was largely borne by the private owners.

Takes New Position

Glenn Townsend has accepted a position with the Rex Paper Co. He was formerly connected with the King Paper Co.

LeRoy W. Allison

Prominent Engineer

Newark, N. J.

Says:

MY DEAR MR. KEENAN:

I cannot refrain from addressing you a line regarding the advancement of PAPER, which I am noting and following with more than ordinary interest. The attractiveness and life that is being put into the journal, commencing with the last few issues, is marked, and I congratulate Mr. Hughes and yourself, as well as your associates, in the course that has evidently been decided upon for the future growth and prosperity of the publication.

Just permit me to extend my sincere congratulations to Mr. Hughes, yourself, and others connected with your department, in the earnest revival which has come about, and I trust that you prosper far beyond immediate expectations.

With kind regards,
Cordially,
Le Roy W. Allison

CONSTRUCTION NEWS

A Summary of Vital Facts Regarding Construction, Finances and Operation of Paper Mills

Deferiet, N. Y.—The St. Regis Paper Co., Watertown, N. Y., has plans nearing completion for the construction of five new units at its local pulp and paper mill, estimated to cost close to $500,000, including equipment. The structures will be one and two-story. A. L. Miller is company engineer.

Muncie, Ind.—The Hinde & Dauch Paper Co., Sandusky, Ohio, is reported to be planning for the purchase of equipment for installation at its local plant, to be rebuilt following a recent fire loss. The work will cost about $65,000.

Philadelphia, Pa.—George A. Bisler, Jr., 710 North Fifth Street, manufacturer of paper boxes and containers, has plans under way for the construction of a new four-story addition, 135x146 ft., for considerable increase in output. The William Steele & Sons Co., 219 North Broad Street, is engineer.

Newark, N. J.—The Progressive Paper Box Co., has filed plans and will commence the construction of a new plant at 341-55 Jelliff Avenue, estimated to cost $90,000.

Minneapolis, Minn.—The Martin F. Falk Paper Co., is said to be planning for the rebuilding of the portion of its works, recently destroyed by fire.

Chicago, Ill.—W. H. Freund & Co., care of Burrett Stephens, 37 West Van Buren Street, architect, have plans under way for the construction of a one and two-story, and basement, paper refinishing plant at 110 North Market Street, estimated to cost about $50,000. It is expected to call for bids at an early date.

Marion, Ind.—The Lindley Box & Paper Co., is said to be arranging a list of equipment for installation in connection with the rebuilding of its plant, recently partially destroyed by fire.

Philadelphia, Pa.—The Corrugated Container Co., Venango and Sepviva Streets, has had plans prepared for the construction of an addition to its plant, to include the installation of new equipment. Improvements will also be made in the present factory. Work will be commenced at an early date.

Pownal, Vt.—Morris Manes, 138 Church Street, North Adams, Mass., is reported to be organizing a company to construct and operate a local pulp and paper mill. with estimated cost placed in excess of $150,000, including equipment.

Burbank, Cal.—William Tisch, Glendale, Cal., and J. J. Stalker, Burbank, have tentative plans for the construction of a new plant in the Fawkes district, where a site 100x300 ft., has been purchased, for the manufacture of paper and fiber boxes and containers. The initial structure will be one-story, 50x150 ft.

Middletown, Ohio—The Frank Smith Paper Co., has commenced the installation of equipment at its new local mill, and expects to have the plant ready for operation at an early date.

New Cumberland, Pa.—The New Cumberland Paper Box Co., is considering plans for the erection of a one-story addition to its plant to provide for considerable increase in capacity. Charles C. Stone is one of the heads of the company, in charge.

New Companies

Danbury, Conn.—The Olmstead Paper Co., has been incorporated with a capital of $25,000, to manufacture and deal in paper products. The incorporators are Seymour L. Durgey and Frederick S. Olmstead. 66 North Street, Danbury.

Cambridge, Mass.—The Shawmut Paper Box Corporation has been incorporated with a capital of $600,000, to manufacture paper boxes and containers. Lyle A. Brown, 3 Bradford Terrace, Brookline, Mass., is president and treasurer.

Baltimore, Md.—The R. C. Paper Products Co., 223 North Calvert Street, has been incorporated with a capital of $30-000, to manufacture and deal in paper goods. The incorporators are Linwood Reese, George W. Steffey and Frank C. Curtis.

Brooklyn, N. Y.—The Rosnap Envelope Mfg. Co., has been incorporated with a capital of $10,000, to manufacture paper boxes, containers, etc. The incorporators are T. Doran, F. Franz and J. Tuthill. The company is represented by M. Silverstein, attorney, 305 Broadway.

Dalton, Mass.—Z. & W. M. Crane, Inc., has been incorporated with a capital of $2,000,000, to take over and operate a local paper mill for the production of writing papers, etc. William G. O'Connell is president; James F. Bacon, vice-president; and Theodore M. Pomeroy, Dalton, treasurer.

Brooklyn, N. Y.—The American Carton Corporation has been incorporated with a capital of $60,000, to manufacture paper boxes, containers and kindred products. The incorporators are D. L. Negel, C. B. McLain and S. Goldberg. The company is represented by H. W. Kiralfy, 565 Fifth Avenue, New York.

Wilmington, Del.—The Coins Card Co., care of the Delaware Charter Co., 904 Market Street, Wilmington, representative, has been incorporated with a capital of $40,000, to manufacture paper specialties.

Brooklyn, N. Y.—The Rutgers Paper Box Co., has been incorporated with a nominal capital of $5,000, to manufacture paper boxes and containers. The incorporators are J. A. Weiss, S. L. Turk and associates. The company is represented by I. B. Schavrien, 50 Court Street, Brooklyn.

Chicago, Ill.—The Chicago Tablet & Stationery Co., has been incorporated with a capital of $90,000, to manufacture and deal in school tablets, writing papers, etc. The incorporators are D. A. Heffner, George S. Melvin and W. R. Tannehill.

Financial

Grand Rapids, Mich.—The American Box Board Co., has filed notice of change of name to the National Box Board Co. The former organization has been dissolved.

Philadelphia, Pa.—The Bridge Paper Co., 1226 North Tenth Street, will operate under the direction of Nathan D. Isen, receiver, appointed by the local court.

Hartford, Conn.—The Merwin Paper Co., has filed notice of company dissolution under state laws.

New York, N. Y.—David Steinhardt and Bern Budd have been appointed receivers for the American Wodpulp Corporation, 347 Madison Avenue.

Otsego, Mich.—The Otsego Paper Stock Co., has filed notice of dissolution under state laws.

New York, N. Y.—The Premier Fibre Box Co., 136 West Twenty-first Street, has filed notice of company dissolution under state laws.

Norwich, Conn.—The Uncas Paperboard Co., has issued 13,490 additional shares of stock, increasing the outstanding capital to $1,350,000.

Plant Operations

Franklin, N. H.—The International Paper Co., has closed its local mill until further notice, releasing about 150 operatives. It is said that lack of orders has necessitated the curtailment. The other mills of the company in different parts of the country and Canada are running close to normal and are expected to continue on this basis. The demand for newsprint maintains at peak and all plants devoted to this line are on a capacity basis.

Newark, Del.—The order recently issued restraining Curtis & Brother, operating a local paper mill, from continuing alleged pollution of White Clay Creek, has been discharged by the Court of Chancery, with decision in favor of the company. A similar complaint against the American Vulcanized Fibre Co., with plant in the same section, has likewise been dismissed.

You Can Make the Week of April 7th either a Dull Week or A BUSY WEEK ! !
Waiting for Business at your Office
Getting Business at the Exposition

Move Your Office Where Business Is

DURING the week of April 7th practically everybody in the country who is interested in PAPER will be in New York. The American Paper & Pulp Association, the National Paper Trade Association and TWENTY OTHER ORGANIZATIONS representing various activities in the paper industry will hold conventions here during this week. Topping the events of this busy week will be the

SECOND ANNUAL
PAPER
INDUSTRIES EXPOSITION

which promises to have a record breaking attendance.

All these conventions and the Exposition will draw paper manufacturers from every part of the country and Canada. Following last year's precedent there will be a tremendous volume of business transacted at the Paper Industries Exposition. Large contracts will be placed and the ways paved for many others in the future.

Can you afford to remain at your office during Exposition week when all prospective purchasers will be at the Exposition placing their orders?

Your place during the week of April 7th should be at the Exposition with an exhibit and several of your salesmen meeting many new prospects and busy every minute securing a large amount of business, which the stay-at-home will never get. That's where things will be happening—that's where you can speed up for the present and build for the future—that's where they will *expect to see you.*

Choice exhibit spaces are still available. Write for diagram and costs.

Paper and Board

New York, January 29—Business in paper of most kinds was of rather routine character during the week. Demand developed in fair volume; it is apparent that consumers are seeking to satisfy their immediate wants only and that few orders are being placed against forward requirements, yet on the whole a moderately good movement of supplies from mills into consuming channels is in progress. Buyers are operating on a strict hand-to-mouth scale, but the fact is, judging from all indications, that the requirements of the average user of paper are on the increase, thus necessitating larger commitments than has been the case over the last month or two.

The situation that has developed in raw material recently seems likely to effect a stronger price position for paper in the very near future. It is true that wood pulp is still rather weak in price and that paper manufacturers are securing this commodity at comparatively cheap figures, but there has been a pronounced firmness in most other kinds of raw stock consumed in the paper mill. Rags are advancing at a rapid pace, old rope is strong, bagging is higher, and waste paper is holding on fairly high price levels. It stands to reason that this must ultimately make for higher prices for paper of many grades, and it is also probable that consumers of paper will soon realize that if matters in the raw material trade keep on as they now are they will lose out by holding off in buying, and thus lead to an influx of buying which in itself will serve to elevate paper values.

Demand for newsprint continues active. Publishers are absorbing their contract commitments, and transient demand is developing in a steady manner and in considerable volume. Print paper prices are firm to an extreme. Mills in general are sold up for an appreciable period and do not have to seek a market for scarcely any part of their output, which of course places newsprint in a strong technical market position.

Newsprint production in the United States in December totaled 117,790 tons, compared with 119,720 tons in November. Shipments from mills amounted to 116,826 tons, against 117,176 tons in November. Canadian mills produced a total of 95,726 tons in December, contrasted with 110,839 tons in the preceding month, while shipments were 100,624 tons, against 110,786 tons in November. These figures show that production was on a high level, considering the holidays in December and the curtailment of mills at the end of the year, also that mill shipments in the U. S. were only about a thousand tons below the production and in Canada were 5,000 tons in excess of the output.

In some quarters it is reported demand for book paper has broadened a little. Book paper mills are still anxious for business and are resorting to price shaving in some instances to get orders. Nevertheless the price tone is fairly steady, certainly it is steadier than it was several weeks ago. Coarse papers are moving in moderately good volume for this time of the year and mills as a rule are managing to keep occupied although few of them are running at full capacity.

Fine papers are enjoying fair activity and display a rising price tendency. Writing paper manufacturers are called on to pay much higher prices for their raw material in the form of rag stock, and are therefore marking up quotations on their products in some instances. Moreover, demand for bonds and ledgers is gradually increasing, giving manufacturers leeway to ask advanced prices.

Box boards are none too active. Demand is against direct needs, with consumers evidently using board in seasonably small amounts. Plain chip board is quoted at around $45 a ton f. o. b. New York, and news board at $50 per ton.

Manufacturing Co.
ATHENS, Wis.

Mechanical Pulp

Mechanical pulp is wanted in fairly good amounts and no further change has developed in prices. Most producers ask from $35 a ton upward at pulp mills for ground wood for prompt shipment, quotations depending on the air dry test and the freight to consuming points. Canadian manufacturers are said to have reduced prices to the $35 a ton level and domestic grinders have done the same in order to compete. Also, foreign pulp imported from Scandinavian sources is available at around $32 a ton ex dock New York or other American Atlantic ports. Indications are that some surplus supply has been accumulated by producers during the last few weeks when weather conditions have been favorable for grinding, which accounts for the softer price tone.

Foreign and Domestic Chemical Pulp

Paper and board manufacturers continue to puchase chemical wood pulp in a limited way. The orders coming in from consuming quarters show quite conclusively that buyers are covering their immediate needs only, and, to say the least, the demand is such as to fail to have influence of strengthening nature on prices. Moreover, there is still some pressure to sell noted, importers or domestic producers having pulp on hand which they are desirous of disposing of, which adds to the irregularity and uncertainty in prices.

Probably the most active kind of pulp at present is unbleached sulphite. Importers reported a fair number of sales of strong foreign unbleached at around 2.60 cents a pound ex dock New York, while foreign easy bleaching sulphite is selling at 2.90 cents on the dock and No. 2 unbleached sulphite at about 2.50 cents ex dock. Bleached sulphite is quoted at around 4 cents per pound on the dock New York for No. 1 foreign, and from 4 to 4.50 cents at pulp mills for No. 1 domestic. Kraft pulp is selling at an average of 2.60 cents per pound for Swedish kraft ex dock New York though some lower prices are named now and then on specific lots of pulp. Quotations ex dock New York and f. o. b. pulp mills are:

Sulphite, screenings, refined	1.50	@	1.75

Domestic Rags

Prices of nearly all kinds of papermaking rags are rising at a rapid clip. Consumers are buying actively and are not hesitating to meet the advanced figures asked, indicating that they are in need of larger supplies, and dealers are taking full advantage of the market condition and are repeatedly marking up quotations. Roofing rags have soared in price to where sales of No. 1 packing have been recorded at 2.20 to 2.25 cents a pound f. o. b. New York, and No. 2 packing is selling at 2 cents a pound or very close to that basis New York. Old thirds and blues have advanced, sales of repacked blues at 3.25 to 3.35 cents at shipping points and of miscellaneous packing at 2.65 cents per pound having been reported. Old white rags are moving upward in value along with other grades, and new cuttings of various description are quoted at firm prices. No. 1 white shirt cuttings are scarcely available in sizeable quantities at less than 11 cents a pound f. o. b. New York, while fancy shirt cuttings are quoted by dealers at 6.50 cents, light silesias at 8.75 cents, blue overall cuttings at 9 cents, and washables at 5.50 cents. Prices on a f. o. b. New York basis are:

Roofing Rags, No. 1	2.20	@	2.30
Roofing Rags, No. 2	1.90	@	2.00

Imported Rags

Foreign papermaking rags also are strong in price and in good demand. Sales of dark colored cottons at 2 cents a pound and higher ex dock New York are reported, and roofing paper manufacturers are said to be purchasing these rags freely. Blue cottons are gradually advancing, and all kinds of linen rags are firm and tending upward. Importers lay much

The Pickles Drying Regulator

Reasons why you should have it on your machine are: First, it regulates the drying of paper automatically, irregularities are eliminated; second, higher machine finished papers are attainable, because it is possible to maintain the proper quantity of moisture in sheet, as it passes to calenders; third, mills having tried it on one machine have ordered it for all their machines. Full particulars upon application to

Bagging, Rope, Etc.

There is not a very large movement of No. 1 scrap bagging but roofing bagging is in good demand and moving higher in price. Sales to roofing paper mills at 1.10 cents a pound and more f. o. b. New York are reported, while No. 1 bagging is quoted at 1.25 to 1.50 cents per pound New York. Old rope is quotably firm and in steady call, with domestic manila rope quoted at 6.50 to 6.75 cents a pound, and foreign manila rope at about 6.25 cents ex dock at this port. Quotations f. o. b. New York are:

Roofing Bagging ..	1.10	@	1.20				

Old Paper

Several of the low qualities of old paper display a declining price trend but generally market levels are well maintained despite a rather slow demand from consumers. Board mills are not very active at the moment and consequently they are absorbing old paper in limited tonnage. Old folded news is quoted at 84 to 90 cents a hundred pounds f. o. b. New York, and No. 1 mixed paper at 65 to 70 cents New York. White shavings are selling at 3.75 to 4 cents a pound f. o. b. this city for No. 1 hard, and at around 3 cents for No. 1 soft shavings Old flat magazines are quoted from 1.50 to 1.75 cents a pound New York, depending on the packing, and old No. 1 kraft paper at 2.15 to 2.25 cents per pound. Prices f.o.b. New York follow:

No. 1 Hard White Shavings	3.75	@	4.00	Kraft No. 1	2.15	@	2.25
No. 2 Hard White Shavings	3.20	@	3.40	New Manila Cuttings	2.00	@	2.25

Twines

The twine market is characterized by fair activity of routine nature, with the strong position of raw material the leading market feature. Manufacturers maintain that the high prices ruling on fibres will eventually make for advances in twine though no changes of note have occured in the past week. Quotations are as follows:

Sisal Hay, pure ...	12.25	@	13.25	Jute Wrapping twine, A grade	19.00	@	
Manila Hay, pure..	16.25	@	17.25	Papermakers Twine.	10.50	@	
Sisal Lath Yarn ..	11.25	@	12.25	B. C. Hemp, 18 ...	.39	@	.40
Manila Rope, pure, ¾ inch diameter.	14.25	@	15.25	B. C. Hemp, 24 ...	.38	@	.39

STRIKING OFF THE BALANCE

PRACTICALLY every business man is striking off a balance for the year 1923. It is fundamental, of course, to any sort of successful business practice that a company should know accurately just how much financial progress has been made and whether the capital has been enhanced or dissipated.

A comparison of this statement with those of previous years will show with more or less accuracy the amount of money that has been made and the growth of the financial capital. This wisdom is from Wroe's Writings of January.

Such a statement does not tell the whole story, however. For the real capital of any business is the ideas on which it is founded and in accordance with which it is operated. The motive force is the intelligent application of these ideas. The real mission of financial capital is to make possible the effective application of good ideas.

It is a singular thing that while no good business man will knowingly permit his financial capital to be carelessly wasted, many are indifferent to the value of ideas which they do not themselves originate, and a few are hostile.

1924 may be a year when we will all have "to watch the pennies." In fact every year is that kind of a year to a growing business, but while we are determined to prevent waste of goods, time and money, let's resolve that no good idea shall go to waste because of our indifference.

For Nineteen Twenty-Four

A little more kindness and a little less creed;
A little more giving and a little less greed;
A little more smile and a little less frown;
A little less kicking a man when he's down;
A little more "we" and a little less "I";
A little more laugh and a little less cry;
A little more flowers on the pathway of life;
And fewer on graves at the end of the stife.

ORR FELTS
and JACKETS

Lowest Cost per Ton

If you judge felt values, not by what you put into the equipment, but what you get out of it—then you will specify ORR 3 stripe Endless Felts for ORR felts will produce the lowest cost per ton. They "stand up" under severe usage. Orr durability is acknowledged everywhere. Their strength and long life are as dependable as their reliability and quality.

In the 32 grades of Felts and Jackets we can match your most exacting demands. Tell us the kind of paper you desire to make, and we will send you samples of felts that will economically serve you and help you to produce paper at lowest cost per ton.

CLASSIFIED DIRECTORY

PAPERMAKING MACHINERY AND SUPPLIES

A handy reference for the busy Purchasing Agent of the Paper and Pulp Industry. Names listed in bold faced type are the regular advertisers in PAPER whom we can recommend for service and satisfaction.

ACID SYSTEMS

Stebbins Eng. & Mfg. Co., Watertown, New York.

AIR COMPRESSORS

Nash Engineering Co., South Norwalk, Conn.

ARCHITECTS AND ENGINEERS

CAREY—James L., Chicago, Ill.
FERGUSON—Hardy S., New York City.
HARDY—George F., New York City.
Stebbins Eng. & Mfg. Co., Watertown, N. Y.
WALLACE—Joseph H., & Co., New York and Montreal.

BEARINGS

LINK-BELT Co., Chicago, Ill.

BEATER PADDLES

Menasha Wood Split Pulley Co., Menasha, Wis.

BELT CONVEYORS

LINK-BELT Co., Chicago, Ill.

BOILERS

Manitowoc Eng. Works, Manitowoc, Wis.

BOND PAPER

KALAMAZOO Vegetable Parchment Co., Kalamazoo, Mich.

BOX BOARDS

STANDARD Paper Co., Kalamazoo, Mich.

BRIMSTONE

UNION Sulphur Co., New York.

CARS

Pulp

Easton Car & Construction Co., 196 Fulton Street, New York City.
Chase Foundry & Mfg. Co., 2800 Parsons Ave., Columbus, Ohio.

CASEIN

California Central Creameries, Inc., 425 Battery. San Francisco, Calif.
Bird & Co., J. A. & W., 88 Pearl St., Boston, Mass.
King, E. & F. & Co., 367 Atlantic Ave., Boston, Mass.
Reardon Company, 127 Clinton, St. Louis, Mo.
Wiarda, John C. & Co., 91 Provost St., Brooklyn, N. Y.
Sheffield By-Products Co., Hobart, N. Y.
Atterbury Bros., 145 Nassau St., (French Imported) New York City.
Casein Mfg. Co., 15 Park Row, New York City.
Duche & Sons, T. M., (Imported), 376 Greenwich St., New York City.
Hamilton Company, 50 Church St., New York City.
Innis, Speiden & Co., Inc., Isco Building, 46 Cliff, New York City.
Kalbfleisch Corp., The, 31 Union Sq., New York City.
Peek & Velsor, 8 Gold, New York City.
Scheel, Wm. H., 159 Maiden Lane, New York City.
Whittaker, Clark & Daniels, Inc., 245 Front (Exp. & Imp.), New York City.
Amalgamated Gum Co., (Vegetable for Wall Paper & Paper Coater Mfgrs.) Troy, N. Y.
Ferguson, Alex C., Jr., 460 Chestnut St., Philadelphia, Pa.
Rosin & Co., Penna. Bldg., Philadelphia, Pa.

The Magazine of the Paper Industry

HOMAS J. KEENAN, F.C.S., Technical Editor
RUSSELL C. HUGHES, Publisher
ISMAR GINSBERG, B.S., Contributing Editor

A Few Stray Thoughts

SINCE the last issue of PAPER appeared, Woodrow Wilson has died. While death was not unexpected, nevertheless it came as a shock to those in this industry as well as those in all others. In death only the good remains. It is well. The history of Woodrow Wilson is secure. He won his high pinnacle by unremitting energy, singleness of purpose and rare gifts of mind and heart. His words dignify and exalt any paper on which they are written. Great in life, Woodrow Wilson will be greater far in death.

* * *

With this number J. E. Willert takes hold of the new department, "Paper Products in PAPER." He is well fitted to handle the task with ability and thoroughness. He has a host of acquaintances in that part of the paper trade. His own experience as a manufacturer and as a salesman of the papers entering into paper products, as well as the specialties themselves, has been large. He is determined to publish the livest thing in that line which ever appeared in any magazine. But he too wants help. He wants the advice and the material aid of all his friends in the industry.

At the present time there is nothing in the trade publications that remotely resembles such a department. It should have the support of every one in that end of the game.

Not a big failure reported for a week. The sun is shining. It looks like the hard days will soon be over. Now if that rainbow doesn't lie.

* * *

Come on into the Paper Industries Exposition. The water's fine. Why should there be any hesitancy on the part of the papermaking companies when the promotion of papermaking in all its various ramifications is the very foundation stones of the exposition.

The arguments regarding why you should be among the others are many. You have probably heard them all. Everybody of consequence will be at the convention which will go on in the same week, that of April 9. The entire paper industry will be watching both the convention and the exposition. It is the trial time of the year.

The one drawback is the queer feeling of reluctance the paper companies and mills themselves have about coming in, although already there is a large list of exhibitors. The supply and machinery companies are entering in splendid array and are doing their share. All it requires now is for another large group of paper companies to put up good exhibits, showing the various ways and means of making paper. This will both inform the public and interest it in papermaking.

Before another 24 hours goes by, it is advisable to get your contract for space off to the Exposition Company.

THE COST OF BOILER FEED WATER

A New Angle on Modern Methods That Reduce Operating Costs

By James T. Beard, 2nd

IMPURE boiler feed water is an important source of unnecesary waste in the power department of the industrial plant, whether it be a paper mill or any other enterprise. Chemically pure water does not exist in Nature and all water will dissolve a certain amount of nearly everything with which it comes in contact.

Many plant managers and operating men are under the impression that their boiler feed water is pure and that any steps taken to remove impurities would be entirely unnecessary. This is largely due to the fact that their boilers have never been condemned by the inspector. It is also due to a false impression that scale in the boilers tubes is one of the necessary evils to be contended with in boiler house operation.

There are many cases, indeed, where the boiler feed water is of an excellent quality. There may be some cases, even, where any treatment at all would be like "carrying coals to Newcastle." If, however, the boilers must be cut out of service at reasonably frequent intervals for general cleaning and overhauling, it is fairly certain that the boiler feed is not all that it should be.

One operating engineer told the writer that his feed water was the very best. He never had to clean the tubes except once in three months and he replaced only two or three tubes a year in each boiler. I wonder what he would say if he could see a certain plant, where proper feed water treatment has practically eliminated tube renewals and boiler cleaning and where a boiler is never cut out of service except for inspection.

The majority of boiler troubles are usually directly traceable to impurities in the feed water used. These impurities are often the cause of leaky seams, leaky tubes, bagging of the metal surfaces, general weakening of the entire boiler construction, boiler explosions, leaky valve in the steam lines, engine trouble, and the like. Long continued use of improperly treated or untreated feed water has in some cases resulted in orders from the insurance inspector to cut down the operating pressure on the boilers affected.

The presence of sewage or an excessive amount of sodium carbonate, either naturally dissolved in the water or left there from the improper treatment, frequently cause boiler water to boil and foam violently. Due to the abnormal activity a large amount of moisture is carried out with the steam. If these "slugs" of water become trapped in the engine cylinder, they may cause serious damage and necessitate costly repairs.

Where there is an excessive amount of priming, as described above, appreciable quantities of salts are carried into the steam lines and deposited on the valve seats, often interfering with the proper closing of the line.

When impurities are carried with the steam into drier rolls of paper machines they will invariably coat the inner surfaces of the rolls, forming an insulating layer and preventing the proper drying of the paper. Under these conditions, the tendency of the machine tender is to open the steam valve a little wider. And the more steam flows, the faster the deposits form. In extreme cases, they will sometimes open the bypass of the steam traps and allow the steam free passage through the rolls to the sewer. Proper feed water treatment in these cases would go a long way toward making these wasteful practises unnecessary.

A LITTLE THING THAT GROWS

JUST because the water going into your boiler is not exactly what it should be seems to be a minor and trifling thing. But is it? Mr. Beard takes up in this article another phase of the question of fuel costs. And what is more vital than this. This is a subject for the power plant of the mill. Read it.

The most harmful and wasteful result of impurities in the boiler feed water, however, is the scale formation that is deposited on the internal boiler heating surfaces when the water is evaporated. These salts coat the inner walls of the shell and tubes with a heat-insulating layer that grows in thickness as the process continues.

This scale produces costly results in two ways:

First, since the scale deposits insulate the water in the boiler from the heat in the furnace, the boiler tubes must be made just so much hotter in order to generate the same amount of steam. Extra coal is required to do this—a definite and measurable waste. The greater heat, to which the metal of the boiler and tubes is subjected, produces greater strains and tends to lesson the life of the equipment. If the layer of scale has been permitted to accumulate to such a thickness that it will no longer let the heat pass through to the water, the tube itself must absorb the heat. These severe conditions are not unusual and cause the metal to blister, bag and even burst. They may even result in a disastrous explosion.

One More Expense

The second expensive result of boiler scale is the labor required to remove the scale, plus the loss of heat and service of the boiler, when it has to be cooled down for cleaning. Periodic cleaning, necessary as it is in some cases, has a weakening effect of the boiler construction, which materially lessens its life. This is due not only to the cleaning process itself, but also to the strain brought upon the various parts by the contraction during cooling and the re-expansion when again fired up.

When a boiler is cut out of service for cleaning, it must be allowed about 18 hours to cool off. The actual cleaning may take another 24 hours, or even more. After that it must be refilled and heated gradually, requiring perhaps 18 or 24 hours more. For practically three days, therefore, the plant is without the service of that boiler. The heat loss and coal waste is represented by the amount of fuel required to bring the boiler up to the line pressure again. The effect of scale, therefore, is to increase the coal consumption, decrease the steam generated by the boiler, decrease the capacity of the plant and to lessen the life of the equipment, to say nothing of introducing an element of danger into the otherwise safe operation of the plant.

The cost of boiler feed water, in terms of increased coal and labor expense, as well as decreased capacity, safety and life of the equipment, may be materially reduced by the proper treatment of the water, before it can do this damage. Unfortunately the fallacy is prevalent that feed water analysis is a job for the chemist and beyond the ken of the average man. With the help of the small water testing cabinets on the market today, however, the average intelligent operating engineer can be his own chemist, insofar as the feed water is concerned. The kit enables a rapid and fairly accurate determination of the impurities in the feed water. It also enables the engineer to prescribe the proper remedy for operating waste and other troubles resulting from such impurities.

May Be Treated in Boiler

After a proper analysis, it may be found that the water is such that it may be treated in the boiler itself, without the expense of elaborate water softening equipment. Many compounds are on the market for this purpose. Some act chemically to precipitate soluble salts. Others act mechanically to loosen the scale that has already formed on sludge settles to the mud drum and is blown out of the boiler at periodic intervals.

If the analysis of the feed water permits the use of this method, it is peculiarly adapted to small plants, where the cost of a more elaborate system would make feed water treatment too expensive. In view of its low first cost it is sometimes preferable to other methods, in spite of the heat loss and coal waste involved in blowing down the boilers.

The method just described, however, is not exact, in that it is impossible to accurately gauge the amount of treatment required by the water. The feed may, therefore, contain an excess of the boiler compound, or the amount of compound fed into the system would make feed water treatment too expensive. In view of its low first cost it is sometimes preferable to other methods, in spite of the heat loss and coal waste involved in blowing down the boilers.

The method just described, however, is not exact, in that it is impossible to accurately gauge the amount of treatment required by the water. The feed may, therefore, contain an excess of the boiler compound, or the amount of compound fed into the system may be insufficient for complete treatment. Where boiler compounds are properly selected and intelligently used, boiler troubles and coal waste are materially reduced and this condition is always reflected in the reduced cost of power.

Boiler feed water may contain such impurities that the method of treatment just described will not be practical. Or, it may be desirable, for other reasons, to treat the water before it is introduced into the boilers.

The simplest method, in such cases, is the heating of the water in an open type of feed water heater. Water that is temporarily hard, *ie.*, whose chemical analysis shows that heating will precipitate all its scale forming salts, may be successfully treated in this way. The heater is installed in conjunction with a settling tank and filter of suitable size, where the precipitated salts are removed before the water is fed to the boilers.

Hard Waters Do Not React

Waters that are permanently hard do not react to the heat treatment, however, and chemical water softeners must be employed. In one type of these softeners, the salts are precipitated by chemical action of certain reagents, which are added to the water in proportion to its needs. In the other type the hardness is removed by allowing the water percolate through a bed of material that absorbs the scale forming salts by a chemical interchange between the water and the softener bed.

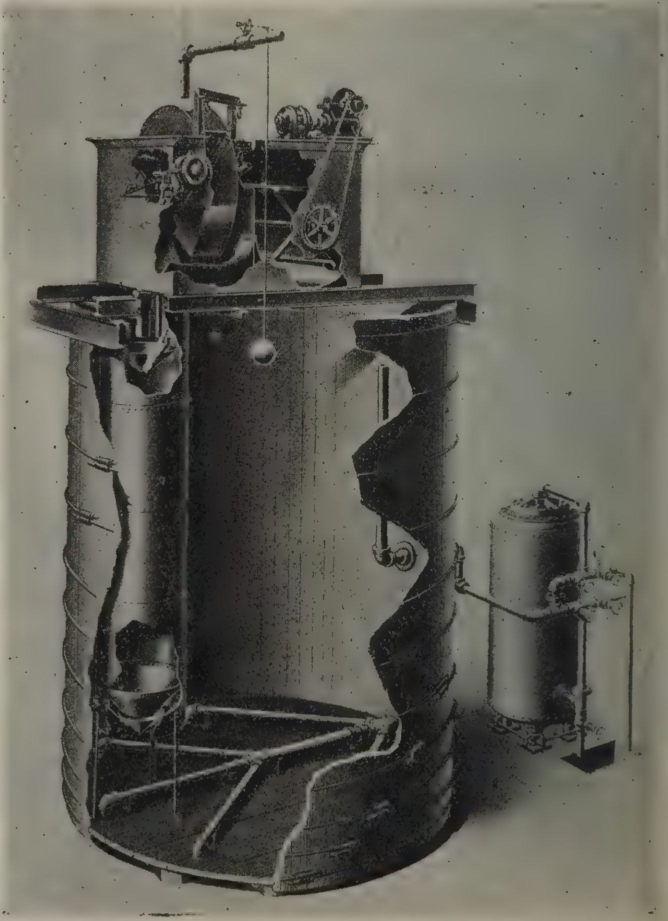
Precipitation softeners are of two kinds. The intermittent type is provided with two settling tanks. One tank fills with untreated water, receives its charge of chemicals, precipitates and settles the salts, while the other delivers the already softened water to the boiler feed line. The continuous type has but one settling basin, which is large enough to permit settling during the time it takes the softened water to flow slowly from inlet to outlet.

The latter type is frequently used in conjunction with open feed water heaters. Heating materially assists the chemical reaction and makes a smaller tank possible.

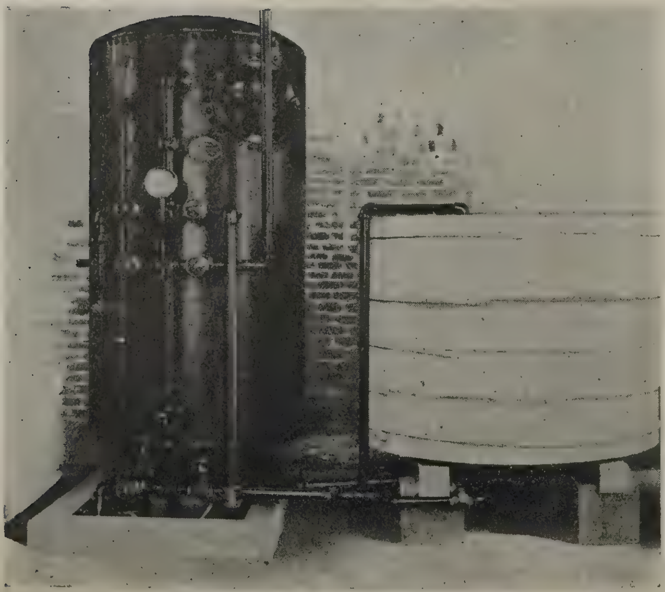
Intermittent softeners are adapted to plants where the percentage of impurities in the boiler water varies considerably from day to day. With this system frequent samples of the water may be readily tested and the treatment altered to suit the requirements.

With zeolite softeners, the feed water is allowed to percolate through a bed of zeolite material, which exchanges its sodium base for the calcium and magnesium bases of the salts in the water. The scale forming salts are

(Right) A Permutit Junior lime-soda water softener specially adapted to the conditions encountered in paper mills generally



(Below) Typical Permutit zeolite water softener for boiler plant service in paper mills. The steel tank contains Permutit material which softens the water, and the wooden tank holds a concentrated salt solution that regenerates the Permutit at stated intervals



thus removed and the water rendered suitable for boiler feed purposes.

A softener of this type can absorb only a certain quantity of scale forming salts, when it becomes saturated. A water meter is usually installed to indicate when this point is reached. It must then be regenerated. If the plant operates 24 hours a day two zeolite softeners are required. When one becomes saturated it is cut out and the other is used, while the first one is regenerated by passing through it a solution of sodium chloride, or common salt.

Just an Illustration

Proper feed water treatment renders a very definite return in terms of lower fuel, labor and power costs. A certain plant was operated 24 hours a day, steam being supplied by one 300-hp. return tubular boiler. Boiler feed water was taken from a large river nearby. Boilers were blown twice a day. Every three weeks it was necessary to shut down the plant, to clean the boiler and tubes. During the end of the three-weeks period the boiler developed a very low efficiency, due to a scale 1/16 in. in thickness. When a suitable softening system had been installed, the scale formation was immediately reduced and it was unnecessary to clean the boiler oftener than once every three months. The actual cost of boiler cleaning alone was reduced one-fourth, to say nothing of the gain in boiler efficiency and fuel saving.

Water from artesian wells is apt to be very bad. An interesting example is offered by a 900-hp. boiler plant, which took its supply of boiler feed from such a source. It was necessary to blow down the boilers every hour and this loss was very high. Boilers were cleaned every Sunday, making a three-weeks' cleaning period for each boiler in the plant. Scale varied from 1/16 to ½ in. in thickness. With proper treatment of the feed water in this plant scale was practically eliminated, saving the regular weekly labor and shutdown losses. In addition nearly $1,000 dollars was saved annually during the summer overhauling. Tube replacements, moreover, had previously cost $4,000 yearly and with treated water they were entirely eliminated.

Fuel saving by feed water treatment is usually quite considerable. A 3450-hp. plant, consisting of 6 boilers and operating 24 hours a day at 150 per cent of rating, recently installed a water softening system. Prior to that time the boilers had been cleaned 12 times a year and each time the scale had been from 1/16 to ¼ in. thick. The feed water was taken from the city mains. During the year following the installation of the water softener (and up to the present time) it has not been necessary to clean a single boiler. The fuel saving as the result of the elimination of scale actually amounted to from 1200 to 1600 gallons of fuel oil daily.

The mere fact that a water softening system is installed, however, does not automatically eliminate operating troubles nor reduce fuel bills. The equipment must have proper supervision and intelligent handling, if best results are to be attained.

How It Works Out

Some time ago the writer was associated in an advisory way with a 2000 hp. boiler plant, where a modern water softening system was installed. In spite of this fact, scale formation and boiler troubles were excessive. There were only five boilers in the plant, and it was not unusual to have two out of service for cleaning at the same time, thus reducing the capacity of the plant to 60 per cent its normal value. Additional capacity was needed and a new boiler was ordered.

At about this time the writer was asked to make an investigation and see what could be done until the new boiler could be delivered and installed. Samples of feed water were taken at his suggestion from various points in the system and analyzed. The results showed that the water at its source and at the softener inlet was very bad. The softener discharge was very good, but the water entering the boilers was very bad again.

The answer was obvious. Untreated water was entering the system at some point between the softener and the boilers. It was suggested to the "chief" that a bypass valve might be open somewhere, but he said there was no bypass. The superintendent was appealed to and he ordered every inch of the feed system be explored until the bypass was found. When it was finally discovered, the valve was found to be wide open. Not long after this incident, the order for the new $15,000 boiler was canceled.

Proper feed water treatment is, therefore, a potent factor in the attainment of low fuel, labor and power costs, a necessary consideration in maintaining continuous and reliable plant production, and a valuable asset in decreasing maintenance costs and in increasing the life of the equipment in the boiler house of the industrial power plant. If an intelligent analysis of the plant conditions indicates the need for one of the systems described, the proper handling of such an installation will return dividends that are really worth while in the matter of reducing costs in the power department.

Increase Dividend Rate

Directors of the Standard Paper Company at Kalamazoo, Mich., at the annual meeting during the week voted to increase the dividend rate from 6 to 8 per cent and to make the amounts payable quarterly. Bartlett C. Dickinson was re-elected president. The other officers are: Vice president, James H. Dewing; secretary-treasurer, Alexander Clark; general manager, John F. Byrne; directors, the above and A. E. Dunwell, J. A. Wheeler, H. S Humphrey and Clare H. Sterns.

New York Trade Notes

Joseph Reichlen, formerly representative in Philadelphia for the McLaurin-Jones Company, manufacturers of fancy and non-curl gummed papers of Brookfield, Mass., is now associated with Mead, Patton & Company, Inc., importers of and dealers in wood pulp at 342 Madison Avenue, New York. Mr. Reichlen is on the sales staff of the latter concern.

* * *

Daniel M. Hicks, Inc., importers of and dealers in papermakers' supplies, announce their removal from Room 606 to Rooms 809 and 811 of the Fifth Avenue Building, 200 Fifth Avenue, New York, where much larger quarters are provided. The concern's telephone numbers are Gramercy 2437-2438 and 2439.

* * *

The United Paper Mill Supply Company, Inc., packers of paper mill supplies of Philadelphia, has opened a branch office at 154 Nassau Street, New York, Room 624.

* * *

The Waste Merchants Association of New York, whose membership includes all of the paper stock dealers and packers in Greater New York, and whose annual dinner is one of the events of Paper Manufacturers' Week in New York each April, has selected Wednesday, April 9, as the date for its yearly banquet this year. The dinner will be given as usual in the Hotel Commodore, and will be followed by a high-class vaudeville entertainment by an array of talented performers. Walter R. Martens, of George W. Millar & Company, Inc., 284 Lafayette Street, New York, is chairman of the dinner committee.

* * *

The Continental Paper and Bag Mills, Inc., announce that they will remove their offices during the latter part of this month from 16 East Fortieth Street to the Pershing Square Building, 100 West Forty-second Street, New York. The International Paper Company, which controls the Continental by majority stock ownership, moved to the latter address last year.

* * *

A petition in bankruptcy has been filed against the United States Paper Manufacturing Corporation, of 17 East Forty-second Street, New York, by the following creditors: State Bank, creditor for $5,000: Bulkley, Dunton & Company, $10,000, and S. D. Leidesdorf & Company, $200. Judge Winslow appointed Charles A. Marshall receiver under $10,000 bond. No statement was issued concerning the concern's liabilities and assets.

* * *

The New York Division of the Salesmen's Association of the Paper Industry has decided to give a special executive luncheon on Wednesday, February 20, which will take the place of the usual Monday luncheon for that week. Members from all parts of the country are invited. Vice President R. D. W. Ewing for the New York Division has named the following committee to make arrangements for the annual convention on April 8, 1924, in New York: F. N. Countiss, chairman; R. K. Baker, E. C. Chadwick, G. A. Keeney, Jr., E. G. Lloyd, W. F. Heath, Chester M. Robbins, J. W. Quimby and G. M. Wetmore. Mr. Ewing and J. L. Fearing are ex-officio members of the committee. In addition the following were named on the committee from other divisions: George K. Gibson, Chicago; F. W. Main, New England; Robert T. Houk, Jr., Ohio, and D. H. Ross, Kalamazoo.

New Developments in Canadian Fuels

Here Are Facts on the Fuel Problem That Will Interest Every One Connected With the Industry

By B. F. HAANEL,

Mines Branch, Department of the Interior, Ottawa

This paper, read before the Technical Section, Canadian Pulp and Paper Association, Montreal, January 23-24, was in response to numerous inquiries during the year regarding additional news on the fuel question. Mr. Haanel knows the fuel question in Canada, as well as in other countries, and what he says is engrossing to everybody.—The Editor.

THE serious fuel shortages which occurred in 1918 and again in 1922 served to direct public attention to the unfortunate position occupied by the central provinces of the Dominion regarding an assured supply of coal suitable for domestic purposes, and to point out the necessity for rendering this area less dependent or altogether independent.

The realization of the gravity of the situation which would exist if foreign exports of coal were entirely cut off, led to the appointment of Parliamentary Fuel Committees and the Dominion Fuel Board. The latter was empowered by Order-in-Council to conduct investigations with a view to finding a solution or solutions of the existing fuel problem. The Dominion Fuel Board has now been functioning for very nearly a year and has underway several important investigations which it is likely will result in the improvement of the fuel situation in central Canada. But, while this body has been able to indicate possible partial solutions of the problem, it has been unable as yet to show how this portion of Canada can be rendered wholly independent of imported coals.

"The Acute Fuel Area"

As has been frequently stated in various papers and reports, which have been prepared by the Dominion Fuel Board, the only section of the Dominion which really would suffer acutely, if imported coals were altogether cut off, is that comprising the provinces of Ontario and Quebec, and this section has been aptly termed "The Acute Fuel Area." It is with the exception of Quebec, almost wholly dependent on the United States or other foreign sources for its fuel supply, not only for domestic, but also for industrial purposes, and it is, therefore, chiefly with this area that the Dominion Fuel Board, and the principal investigations which it has undertaken is concerned.

The fuel shortage which occurred in 1918 also had the effect of inducing the Federal Government, in association with the governments of Saskatchewan and Manitoba, to create the Lignite Utilization Board, and in association with the government of Ontario to create a Joint Peat Committee for the purpose of conducting special investigations relating to the conversion of the lower grade fuels, lignite and peat, into a product suitable for domestic purposes. The Peat Committee recently completed its work and has issued a favorable interim report.

The subject of this paper "Recent Developments in the Use of Canadian Fuels" rather limits the writer regarding information concerning fuels which might be placed before the Association. Such a title would be very appropriate for a paper on fuels written for a European or United States Technical association, since the larger amount of fuel research work is naturally carried on in those countries which are densely populated and highly industrialized. The necessity for utilizing fuels in the most efficient manner in such countries is manifest, but in a country like Canada, which covers a wide stretch of territory and which comparatively speaking, is sparsely populated, and yet at the same time possesses enormous quantities of fuel, the necessity for practising the most efficient methods is not so apparent.

This applies to Canada as a whole, but unfortunately, the most thickly populated portion of Canada, and at the same time the most highly industrialized, lies within the "Acute Fuel Area" and in this area a real need for the introduction of efficient methods for the utilization of fuels and the practice of rigid economies actually exists.

The dependence of this area on foreign sources of fuel is not so apparent in connection with industrial fuels as it is with fuels for domestic purposes, since the fuel almost wholly used for the latter is American anthracite, and the price of this coal is steadily advancing, its quality deteriorating and its annual production scarcely keeping pace with the demand, and moreover, its export may at any time be entirely cut off. This is not the case with the industrial fuels, such as, cooking coals, gas coals and steam raising coals. These can be obtained in large quantities from the United States and at comparatively low prices. Moreover, the absence of supplies of native industrial coals in Ontario and Quebec is mitigated to a large extent —so far as power requirements is concerned—by the large hydro-electric developments which now makes possible the delivery of large quantities of energy equivalent on a heat unit basis to several million tons of coal.

The Continuous Supply

The problem, therefore, narrows down practically to that of assuring a continuous supply of fuels for domestic purposes, and it is in this connection that the more important research work has been conducted with a view to devising processes for converting the lower grade fuels into a product suitable for domestic purposes, and also convert the higher grade bituminous coals into an acceptable domestic fuel.

Recent developments in the use of fuels which will be discussed, pertain to the manufacture or preparation of coals—in their raw state unsuitable for domestic purposes—into a satisfactory product and the substitution of Canadian coals for industrial and domestic purposes. They may be enumerated as follows::

1—The elimination of anthracite coal, and to a certain extent American bituminous coal, in Manitoba, by the capture of this market by Alberta coal operators.

2—The regaining by Nova Scotia coal operators of the pre-war St. Lawrence market.

3—The successful development of machinery for manufacturing peat fuel according to the Air-dried-machine-peat process.

4—The proposed introduction of pulverized fuel in a central heating plant at Winnipeg and in a power plant in Ontario.

5—The development of a process for converting low grade Saskatchewan lignites into a high grade domestic fuel, by means of carbonizing and briquetting.

6—The erection at Walkersville of a plant by Henry Ford for treating bituminous coal according to a new and novel low temperature carbonization process.

7—The introduction of by-product as a domestic fuel in place of anthractie.

1—Prior to the war, and for a few years thereafter, the province of Manitoba used imported anthracite almost exclusively for domestic purposes and imported bituminous coal for industrial purposes. The efforts made by Alberta coal operators to introduce Alberta coals into Manitoba for domestic purposes especially have met with complete success. Manitoba today imports but a very small portion of her total domestic fuel requirements from the United States, and it appears that Alberta bituminous coals are also being successfully introduced for industrial purposes. The coals which Alberta supplies to Manitoba for domestic purposes are the high grade lignites found in the Drumheller and Lethbridge districts. These lignites when shipped have a moisture content of approximately 10 or 15 per cent and a comparatively low ash content and a heating value in the vicinity of 10,500 B.T.U. per pound. The deterioration of the coal is not excessive in transit when the haul is short, but for long hauls it is advisable to ship the coal in box cars.

The High Cost of Hauling

Efforts to introduce Alberta coal for domestic purposes into the province of Ontario, have not met with success on account of the high cost of hauling from mine to destination. The greatly reduced special rate in train load lots which the President of the Canadian National Railways granted for a few months in the year for the transportation of these lignite coals did not in the first year of its operation result in the development of a large amount of business. So as yet Alberta coal does not play an important role in the solution of the fuel problem of the "Acute Fuel Area." Efforts are still being made to create a market for these coals in Ontario and no doubt the special rate will be repeated for limited periods during each year. Time alone will disclose the success or failure of such efforts.

Lignitic coals suitable for domestic purposes, must undergo a very thorough screening at the mines before loading onto cars, in order to reduce to a minimum, the quantity of fines. This naturally entails a large wastage at the mines, since these fines are of little use for industrial purposes and are certainly not suitable for domestic purposes in that state. In order to convert the fines into a domestic fuel, briquetting would have to be resorted to and successful briquetting could not be accomplished without first submitting the fuel to heat treatment. The cost of manufacturing in relation to selling price and the limited quantity of briquettes for which a market could be found would not warrant such processing of the mine screenings.

2.—Regarding the re-gaining of the St.

Lawrence pre-war market, which during the war was partially lost, is sufficient to say that the province of Quebec, at least, is able to absorb a large quantity of the coal which can be annually mined in Nova Scotia, but the quantity which is mined in Nova Scotia and which can be mined with the present equipment is limited, and even though the Nova Scotia mines increase the production to the highest level which was attained before the war, it is questionable whether the quantity of fuel thus mined would supply the requirements of Nova Scotia and those of Quebec.

In the near future, we shall probably witness the production of coal in Nova Scotia on a much larger scale and the shipment of this coal to Quebec and certain points in Ontario, which can be economically served by water transportation, or those points which are not too far distant, by rail, from the mines. It is, however, scarcely probable that Ontario can ever depend to a very large extent on Nova Scotia bituminous coal for industrial and domestic requirements.

3.—The successful development of machinery for manufacturing peat according to the Air-dried-machine-peat process, which is the result of the investigation conducted during the past five years, by the Joint Peat Committee, appointed by the Federal Government and the Government of the Province of Ontario, makes available the large fuel resources now lying dormant in the many peat bogs which are strategetically situated throughout the more inhabited portions of these two provinces.

Facts About Peat

Peat manufactured according to the Air-dried-machine-peat process produces a fuel which is entirely satisfactory and very desirable for domestic purposes. This fuel can be used to great advantage and more efficiently than the higher grade coals, such as anthracite or even metallurgical coke, in the early spring and late fall in hot air furnaces, hot water furnaces, and during the entire year, in kitchen ranges and fire places. In the course of this investigation the Peat Committee through the employment of a new type of pulverizer, namely, a swing hammermill shredder, succeeded in materially increasing the apparent density of the peat blocks, and this has had a very beneficial effect on the burning qualities of the fuel. The cost of loading on car one ton of fuel produced by a manufacturing unit of a capacity of 20,000 tons of peat per season of 100 days, operating 20 hours a day, was determined by the Peat Committee to be $3.50 including all expenses, and the peat manufactured in the course of the investigation, which amounted to several thousand tons, was sold at $5.00 per ton f. o. b. cars.

A company has been formed and has taken over the plant on the bog at Alfred, Ontario, which was operated by the Peat Committee, and this company will remodel the plant according to the recommendations, which the Peat Committee considered to be essential for conducting commercial operations. The fuel produced by the company at the Alfred plant will practically all be sold for domestic purposes, and the writer has been informed will be available for next season's requirements. However, a much wider field will be opened up for the utilization of peat fuel for industrial purposes when the manufacture of the fuel has been well established and large quantities are available.

The chemical analysis of the various samples of peat representative of the bogs in the provinces of Ontario and Quebec so far investigated by the Federal Department of Mines show that the average nitrogen content is very high—about 2 per cent of the absolutely dry peat. This should be kept in mind when the utilization of peat for the production of power either through the media of a steam generator and steam engine or a gas producer and gas engine is considered. If it is desired to generate power, the most efficient method to employ is that which makes possible the maximum recovery of the nitrogen in the form of ammonia or ammonia compounds. When peat is gasified in a Mond by-product recovery producer, the nitrogen content of the fuel is largely recovered in the form of ammonia and this in turn is converted into ammonium sulphate, a valuable fertilizer for which the demand is considerable. When peat is burned in a producer of this type, approximately 75 per cent of its nitrogen content is recovered as ammonium sulphate, and, when the credits for the sale of this are allowed for, the power gas generated can be disposed of very cheaply. It is not probable that the demand for peat as a fuel for steam raising will ever assume any importance, it is too valuable a fuel for other purposes.

4.—The utilization of solid fuels in the powdered form for metallurgical and industrial purposes in general is gaining great importance, especially in the United States where large power plants are now in operation burning fuel in the powdered form. The advantages of using fuel in the powdered form are:

1.—Complete combustion.

2.—Possibility of using coals high in ash.

3.—Possibility of using the lower grade fuels such as lignite and peat to greater advantage than when they are burned in the solid form according to conventional methods.

4.—Decrease in labor cost due to a reduction in the number of firemen required.

5.—Ease of regulation to suit working conditions.

Improvements are continually being made in the methods and apparatus for burning powdered coal and this system is now said to be very nearly as simple and easy to operate as the mechanical stokers so largely employed for burning coal in large steam plants.

A very large field appears to exist for the generation of steam by burning coal in the powdered state in the prairie provinces where the only fuels met with are lignites, some, for example those of Saskatchewan, being of low grade. When the demand for power becomes of sufficient magnitude in that portion of Canada, it may be found that these lignites can be most efficiently used in the powdered state without any expensive preliminary treatment, such as artificial drying and pulverizing to the degree of fineness which is found necessary with bituminous coal.

But a much more important field for the application of powdered fuel appears to the writer to exist in the generation of steam on the locomotives of the transcontinental railways traversing the prairie provinces where the burning of lignite coals is now prohibited during the summer season on account of the fire hazard caused by the emission of dangerous sparks when lignite coal is burned in the ordinary manner on grates. The writer has been informed that locomotives for burning in the powdered state the low grade coal of Brazil are in successful operation on the railways in Brazil. If the low grade coals of the Western provinces can be burned in locomotives in a similar manner, the quantity of fuels now imported from the United States for railway purposes can be materially reduced and moreover, the power developed in locomotives considerably increased. An investigation to determine the feasibility of utilizing fuels in the powdered form on locomotives, the writer believes will disclose great possibilities.

5.—The carbonization and briquetting of the low grade lignites of Saskatchewan with a view to producing a domestic fuel to displace anthracite coal in Manitoba and portions of Southern Saskatchewan, it was believed would open up large fields for the exploitation of the low grade coals of Saskatchewan and those of Southern Manitoba, and eventually displace the anthracite coal annually imported for domestic purposes in Manitoba and portions of Saskatchewan. At the time the investigation was begun by the Lignite Utilization Board to develop a process for carbonizing and briquetting the Saskatchewan lignites, a real need existed for finding a satisfactory substitute for anthracite coal which was continually increasing in cost to the consumer, but as stated above, before the investigation was completed and it is not completed yet, the domestic fuel market of Manitoba was captured by the coal operators of Alberta. So the field which now exists for the application of a successful method of carbonizing and briquetting lignites is uncertain. In connection with the process developed by the Lignite Utilization Board and the one which that Board is now employing, namely, the Hood-Odell Carbonizer, it is of interest to note that the by-products recovered are of small importance and do not have a bearing on the cost of the finished fuel.

6.—The process above described may be termed a low temperature carbonization process. This and the process devised by Pirron and Caracristi are the only two low temperature carbonization processes which have been attempted in Canada. The latter is being installed at Walkerville, Ontario, at the Ford plant, and will, the writer has been informed, be put in operation in the near future. Large quantities of bituminous coal will be carbonized daily at this plant for the main purpose of recovering tar oils and other by-products. The carbonized residue will be used in the powdered form for generating steam.

The most important claim made for the Pirron-Caracristi process is that very large quantities of tar oils can be recovered and that with it high volatile coals will prove a valuable source of oil which can be refined for motor and other purposes. In brief, the Pirron-Caracristi process consists in carbonizing coal in a more or less finely divided condition on a moving table which floats on a bath or molten lead. The temperature at which carbonization takes place is, therefore, uniform and easily controlled. It is also claimed that the time of carbonization is reduced to a minimum.

In connection with low temperature carbonization it may be interesting to note that a car load of peat fuel, manufactured by the Peat Committee at Alfred, was sent to the Longford plant of the Standard Chemical Company, to determine whether peat could be successfully carbonized in retorts specially designed for distilling hardwood. The results of the test, conducted there, demonstrated that peat was an excellent fuel for that purpose, that the by-products obtained were satisfactory, with the exception, principally, of alcohol which was of lesser quantity, and that the larger quantity and high quality of the peat charcoal produced almost offset the decrease in the quantities of alcohol, acetic acid, etc. The conclusion arrived at was, that when hardwood becomes too scarce for distilling in this manner, peat will be in demand as a substitute.

7.—The processes most generally employed throughout the entire civilized world for carbonizing coal employ high temperatures. By-product recovery coke oven in which all of the coal carbonized in the United States, Europe and Canada is coked, employs a high temperature. With this process the maximum yield of coke is produced, a large quantity of by-products and a large quantity of gas of high heating value.

With a view to finding a substitute for the anthracite annually imported into both Ontario and Quebec for domestic purposes, the Dominion Fuel Board undertook an investigation to determine the feasibility of erecting by-product recovery coke plants at strategic points in Ontario and Quebec for manufacturing a domestic fuel from Canadian fuels when and where possible, and from coals imported from the United States. With such a process not only is it possible to produce a highly satisfactory domestic fuel, but also a large quantity of gas in addition to other by-products. The gas can be successfully employed for domestic and other purposes in place of the gas now generated in gas retorts. The results of this investigation, when completed, may show that a considerable portion of the anthracite now annually imported into Ontario and Quebec can be replaced by by-product oven coke and that the gas generated in the by-product recovery plants, if erected, can be satisfactorily and profitably disposed of to existing gas companies. A ready market exists for the other by-products such as benzol, tar oils, and ammonium sulphite. When plants of this type are put in operation a fuel equal in every respect to anthracite will be available for domestic purposes at a price considerably lower than that at which anthracite is now being sold. It should be borne in mind when considering the value of coke for domestic purposes that the quality of the anthracite now annually imported is deteriorating, consequently, the heating value is lower and will become lower, whereas suitable coals for coking purposes low in ash can be procured in abundance from the United States and from Nova Scotia Collieries at a comparatively low cost.

Through the exploitation of the peat resources of Ontario and Quebec on a large scale, the establishment of by-product coke ovens at strategic points in Ontario and Quebec, and the utilization of low grade western fuels in the powdered form as a fuel for railway locomotives, a very substantial reduction may be looked for in the importation of both domestic and industrial fuels.

EDUCATIONAL WORK BEING PUSHED

Wisconsin Pulp and Paper Industry Has Advanced by This Method

By B. T. McBain

THREE seasons ago the Nekoosa Edwards Paper Company pioneered in the work of the Wisconsin University Extension Division and started a few evening classes; but without much success. The next year they profited by what they termed their mistakes and experience with the result that of 131 men starting the work, 78% finished and received diplomas.

This year, there are classes in Chemical Pulp and Paper, also in Steam and Electricity at Port Edwards and Nekoosa and other mills are taking up the work. There are classes now at Mosinee among the employees of the Wausau Sulphate Fibre Co. and the Rothschild with Marathon Mills employees, also the Kimberly employees of the Kimberly-Clark Co. so that today there are about 300 paper mill workers taking University work through the Extension Division of the University of Wisconsin.

Each class has its own Instructor and they meet at least once each week. Assignments are prepared at Madison and forwarded in time for the meetings each week and the questions therein must be answered in writing and returned to Madison each week for checking.

Recently Marshall Graf of Wausau, Field representative of the University of Madison and Prof. Curan of Madison held a Kraft Pulp class at Port Edwards which was attended by Nekoosa workers as well.

Prof. Curran outlined the work of the year and what is to follow and evidently the 1924-25 class will be of even greater size than the ones now being held, for in 1924 the work of the paper mill will be treated in detail and many more of the workers have expressed themselves as wanting to avail themselves of the opportunity offered to better themselves in their chosen life work.

Prof. Elliott comes up from Madison to Port Edwards each week and takes charge of the steam class, which is made up of 48 Nekoosa and Port Edwards men.

The Salesman's Forum

Here's a Famous One

Everywhere that papermaking machinery is used, this cheery, inspiring face is known. He has been throughout the Eastern States and Canada and he is not only a worthy representative for his company, and a good fellow—but he sells machinery for the Cameron Machine Company of Brooklyn. At present he is convalescing rapidly after an illness of nearly two months' duration.

W. E. BLAUVELT

Mr. Blauvelt has traveled this territory for several years and is well known to the trade, particularly about the mills. His extensive experience with paper working machinery of all kinds qualifies him to advise on many of the questions which trouble the mill man. Although he enjoyed a good year in 1923, from a sales standpoint, Mr. Blauvelt is confident that once he is back in harness he will be able to do even better in 1924.

During his illness, the territory has been covered by Mr. J. B. Venturini, of the Cameron sales staff.

Look for him.

* * *

Buy Timber Tracts

Various pulp and paper interests have purchased timber tracts in New Hampshire and Vermont during the past few weeks from Newman & Wheeler. The sales include 2,700 acres in the towns of Benton and Warren, N. H., largely spruce; 7,800 acres of hard and soft woods in Ludlow and Andover, Vt., and 5,600 acres in Washington, N. H. It is understood that immediate cutting operations will be started on these new tracts by the purchasers.

NOTHING NEW IN THE BIG MERGER

Expect $30,000,000 Bond Issue Will Finance New Proposition

THERE is nothing new in the negotiations that have been conducted with a view to the merging of the Laurentide, Belgo and St. Maurice pulp and paper companies. It is quite evident that those promoting the merger have not yet convinced the Laurentide interests that it would be to their advantage to enter. This view seems to be held by the market generally, for it is significant that Laurentide stock rose when reports got around that negotiations were off for the time being.

It is expected that if the deal goes through there will be a $30,000,000 bond issue and the syndicate handling it would probably be headed by the National City Company, which has been conducting the merger negotiations. Canadian bond houses would be asked to assist in placing the issue, but it is expected that the greater part of the money would be secured in New York. If the deal should go through, the Laurentide Company would be the most important factor. It was founded by Sir William Van Horne, an American, has total assets of $35,000,000 and its only outstanding security is $28,000,000 of common stock. Its chief benefit from the merger would be the enhancement of its timber resources through the acquisition of the unexploited limits of the other companies. The Belgo-Canadian Company was founded by Belgian capitalists. Its total assets are over $21,000,000, and its outstanding securities consist of $8,000,000 of bonds, $4,000,000 of preferred stock and $8,500,000 of common. The St. Maurice Company is the Canadian subsidiary of the Union Bag and Paper Corporation. Its only outstanding security is $9,874,000 of common stock. The St. Lawrence Paper Mills are a Canadian concern. It has a daily capacity of 160 tons of newsprint. It has issued $1,500,000 of preferred shares and $40,000 of common stock; a bond issue of $2,500,000 has been authorized but not issued.

* * *

Hatch Ends Contract

Raymond S. Hatch, who has been general manager of the waxed and greaseproof paper plant of the Hamersley Manufacturing Company, Garfield, N. J., for the past three years, is no longer connected with that firm, his contract having expired. He has no definite plans for resuming work and is taking a well earned rest. He intends to run up to Canada for a while and do some investigating at one of the Quebec mills. Mr. Hatch was chemist at the Crocker-McElwain mills in Holyoke, Mass., before going with the Hamersley Manufacturing Company, where he succeeded W. H. Gesell.

* * *

Fred C. Clark Resigns

Fred C. Clark, formerly in charge of the Paper Section of the Bureau of Standards, Washington, D. C., but more recently identified with the Pejepscot Paper Company, Brunswick, Me., has resigned as vice president and general manager of the plant there and is looking for a new connection.

* * *

No Longer With Hamersley

R. P. Hill, who was associated with "Ray" Hatch in the management of the waxed and greaseproof paper plant of the Hamersley Manufacturing Company at Garfield, N. J., is no longer with that firm. He is not communicative about his future movements.

New Record in News Print

Production of 2,824,000 Tons in North America Sets New Record—Nine Per Cent More Than 1922

By R. S. KELLOGG

Secretary, News Print Service Bureau

Despite Competition

The following article which is part of the report of R. S. Kellogg, Secretary of the News Print Service Bureau, made at the annual meeting of the Bureau in Montreal, Canada, Friday, January 25, presents an amazing record of achievement for the news print mills of the land.

That the mills produced nine per cent more news print paper this year than last, against all the foreign competition, and business depression, is a remarkable commentary upon this branch of the industry and the Service Bureau. Here are facts presented that should be read by every papermaker or paper dealer.—The Editor.

THE production of news print paper in North America hung up a new record in 1923, the total for the United States and Canada surpassing 218,000 tons or nearly 9 per cent the previous high mark of 2,530,000 tons in 1922.

The United States mills produced 1,485,000 tons of news print or 37,000 tons more than in 1922 and also more than any previous year except 1920 when the total was 1,512,000 tons. In 1920, however, the output of the regular news print mills in the United States was supplemented by perhaps 80,00 tons from the so-called marginal mills, which have not contributed so heavily to the news print supply since that time of abnormally high prices.

The rapid development of news print manufacture in Canada is strikingly shown by the fact that the output last year was 1,263,000 tons or 181,000 tons more than in 1922 and 455,000 tons or 56 per cent more than in 1921.

In addition to these totals for the United States and Canada, 64,000 tons of news print was produced in New foundland and 12,000 tons in the one mill in Mexico that makes news print, thus giving a production of 2,824,000 tons for the North American Continent or two-thirds of all the news print paper produced in the world.

In addition to this record-breaking production, with over 80 per cent of Canada's news print marketed in the United States, some 200,000 tons of Scandinavian, German and Finnish news print paper was sent to the publishers in Uncle Sam's domain in 1923, compared with 133,000 tons in 1922 and 135,000 tons in 1921.

As the production figures suggest, the consumption of news print paper in the United States reached a new high record in 1923. In round numbers it was 15 per cent more than in 1922 and 28 per cent more than in 1920.

Adding imports to domestic production and deducting the small amount of exports, there was 50 lbs. per capita of news print paper available for consumption in the United States in 1923 than in 1922 but still 21 per cent increase of 230 per cent in per capita consumption in 23 years explains why the United States uses more print paper than all the other countries of the world combined.

Advertising as usual was an important factor in determining the quantity of news print used in 1923, but influential also were the large sizes of the daily and Sunday issues and the growth in circulation. There are some 60 newspapers in the United States, each having a circulation in excess of 100,000 copies. During 1923 these dailies averaged 27 pages and the Sunday issues 101 pages—sizes never before attained.

There are more than 22,000 newspapers in the United States and Canada of which some 18,000 are monthlies and country weeklies while the circulation of the 2,000-odd English language dailies is approximately 31,000,000 for the week-day issues and 21,000,000 for the Sunday issues. A well-known newspaper has increased in circulation from 93,000 copies to 584,000 copies of its daily issues since 1903 and from 196,000 copies to 932,000 copies for the Sunday issues in the past 20 years, and this is by no means an isolated example of newspaper growth. There is now a copy of a daily paper published for every family in the United States and Canada. The daily newspaper habit is well-nigh universal north of the Rio Grande.

The total volume of newspaper advertising in the leading cities of the United States showed an increase in 1923 over 1922 of 7 per cent and of 2 per cent over the 1920 record figure. The newspapers fared even better than the magazines in the advertising field, since the volume of advertising in the National periodicals was 19 per cent more in 1923 than in 1922 but still 21 per cent behind the 1920 total.

The large volume of advertising, both periodical and newspaper, planned for and to be expected during 1924 is a matter of common knowledge. It looks as if the time were not far distant when the total yearly expenditure for advertising by means of the printed page in North America would be one-billion dollars.

Paper manufacturing in North America is a billion and a half dollar industry with the production of news print making up a very respectable proportion of the total investment and further notable developments under way. There were 10 new machines with a total daily capacity of 670 tons which came into production in 1923, and four more of 385 tons capacity are scheduled for this month. The North American news print mills now have a rated capacity of 10,000 tons daily with further substantial additions under way for the latter part of the year and for 1925, so that there should be no need for any newspaper publisher to go abroad for his supply of white paper.

* * *

They Were There

At the last meeting of the Superintendents' Association, Tom Harvey, of the Gardner-Harvey Paper Co., Middletown, Ohio, spoke on "How to Make Ourselves More Valuable to the People Who Employ Us." A very good crowd was present. Among those were E. H. Gilman, Bryant Paper Co.; E. T. A. Coughlin, Allied Paper Mills; Professor Hayward, U. of M.; Alex McVie, Maiser, Joe Loughead, Western Paper Mill Supply Co.; George McGuire, Bryant Paper Co.; Jacob Parent, Western Board & Paper Co.; Herb DeYoung, Allied Mills; Albert Lindners, Allied Mills; George Pountain, Allied Mills; Alfred Bryant, Bryant Paper Co.; E. L. Mongrieg, U. S. Rubber Co.; Mr. Wilcox, U. S. Rubber Co.; Mr. Burns, Eddy Paper Corporation; Frank Johnson, Allied Mills; A. G. Whightman, Hawthorne Paper Co.; Vern Hotelling, Watervliet Paper Co.; Clarence Thorne; Watervliet Paper Co.; Mike Redmond, Kalamazoo Paper Co.; Jake Kuss, Allied Mills; Emil Yahnke, Standard Paper Co.; N. M. Brisbois, Sutherland Paper Co.; Mr. Foxglover, Clarence Harter, Rex Paper Co.; Bernard Benson, William Gray Co.; Mr. Burroughs, Harry Urich, MacSimBar Paper Co.; Mr. Aitstin, Wolverine Paper Co.; Mr. Sevard, Michigan Carton Co.; C. G. McClellain, Kalamazoo Vegetable Parchment Co.; W. A. Yule, Kenwood Felts.

Granted a Charter

The Nipigon Corporation, Limited, has been granted an Ontario charter with power to construct and operate pulp and paper mills and to engage in the manufacture of pulp, paper, and paper products, together with lumbering operations. The authorized capital is $50,000 and Hamilton, Ont., lawyers are mentioned as the incorporators.

J. B. Dillon Says

Denver, Colo.

DEAR FOLKS:

One would have to be very much prejudiced, or awful envious if they did not admit that PAPER is improving, a la Coue. Edition after edition it shows in better condition. Congratulations.

Cordially and Sincerely yours,

J. B. DILLON.

Good Business to Protect Your Employees

The Safety First Problem in the Paper Mill Explained in a Thorough Manner

By H. F. OBERMANNS,
Hammermill Paper Company,
Erie, Pa.

A GREAT deal has been said and done under the mantle of safety work in recent years and yet in the final analysis the principal reason for getting these things done is that it is good business. It is good business to protect and safeguard the life and health of your employees, because an injured or crippled employee cannot do as efficient work as one who possesses all his limbs. A man whose attention is continuously called to the unsafe conditions and surroundings of the machinery with which he has to work, cannot do perfect work and the employee who has to take the place of an injured man has to be educated, for which large sums have to be paid until he has reached the efficiency of his predecessor. There is, of course, the human element which must not be overlooked.

I just made the statement that safety work must pay and yet there are many paper plants as well as thousands of employees in the country, who do not believe in it and who simply do a minimum amount of safety work just because the law requires it or because they find that by doing so they are able to get a somewhat cheaper insurance rate.

In our own plant we have recognized the value and importance of proper safety work and while it has to be admitted that great improvements can still be made, we feel that in paper mills at least, and the writer has seen a great many of them in this country, ours can be considered a very well-guarded plant. However, guarding pieces of mechanism is perhaps the smallest feature entering into real safety work. A guard will not offer in a great many instances, 100 per cent protection, it will not prevent accidents unless the man himself is imbued with the proper safety spirit and here again what can you expect of the man if he finds that his immediate superior looks upon safety work only as a necessary evil. The real value of safety work can only be obtained if together with proper and efficient guards, everyone in the organization from the lowest to the highest earnestly strive to eliminate accidents which are wasteful in time, money and materials to the company as well as to the employee.

It is not the object of this article to go into detail as to the type of guards recommended and I shall only take a hasty trip through the plant, dwelling on the most important factors from the safety standpoint, in each department.

WOOD YARD. Enormous quantities of wood have to be handled in the course of a year, sometimes under very unfavorable conditions. In the spring the sap of the wood has not completely dried, making the logs slippery and hard to stand on or to handle. Summer rains very often increase this difficulty and in winter the logs frozen or encrusted with ice from which the pick used in handling the wood very often slips, do not materially aid to make this job any safer. Very little can be done in this particular department in the line of safety guard and the best protection and insurance against accidents is a safe employee.

WOOD ROOM. A great deal of what has been said about the Wood Yard is also true of this department, although numerous mechanical appliances are in use in the Wood Room which unless properly guarded, are decidedly dangerous. One of the worst sources of accidents in a Wood Room are the old type disc barker, which fortunately owing to their wasteful operation, are gradually disappearing. Wherever they are used, however, they should always be used in connection with a mechanical attachment which holds and rotates the stick of wood against the barking disc. In mills making fine grades of paper it is necessary to trim and clean the logs by means of hand hatchets and here again extreme caution on the part of the operator is the only safeguard that can be offered for his protection.

ACID PLANT AND DIGESTERS of the Sulphite Mill offer numerous sources for possible injuries. The gases developed in such a plant if given in concentrated doses, are very suffocating and gas masks of the best type should be available at such location where they are readily available. Chip Bins and Blow Pits of the Digesters must be safeguarded in such a way that operators finding it necessary to conduct work in either will be promptly notified before a Digester is either filled or blown. In another part of the Sulphite Mill bleaching powder or liquid chlorine is used in fairly large quantities. This gas is much more poisonous than the sulphur-dioxide gases used in the acid plant and proper precautions have to be taken particularly where liquid gas is used. The best recommendation in this connection is to have gas masks available also water hoses wherever the possibility exists for a leak to develop.

PAPER MILL. The Paper Mill as a rule offers few hazards largely because papermakers as a rule are skilled operators who during their many years of preparation for their trade have become fully aware of the dangers connected with their occupation. A modern paper machine, however properly equipped with guards wherever possible, offers few hazards. The paper machine calender perhaps is still nipping off finger tips and no man except the operators entrusted with this particular job should be permitted to handle paper at this point. Perhaps the most dangerous part on the paper machine is the reel particularly in mills where the old type upright reel is still in use. This is positively dangerous and inasmuch as the point between reels cannot be guarded it should be eliminated. The various types of drum winders particularly those revolving in such a direction as to offer a "nip" on the operator's side also have to be operated with the utmost care.

I purposely do not mention safeguarding clutches, pulleys, shafts, set screws et cetera as these things should be taken care of in any factory whether paper mill or otherwise.

In closing I want to say a word regarding a factory organization such as a Safety Committee which can be of wonderful benefit. Such an organization should consist not only of the Superintendents and Executives of the plant (it is important that these should faithfully attend) but it should include men selected from the ranks of the operators as well. This mill committee should be changed at frequent intervals so as to give everyone a chance to serve on the Committee and in order to keep interest alive among the operators. A safety committee consisting of the executives of the plant can easily decide where guards should be put and how they ought to be made but that part of the Safety Committee consisting of the operators will see to it that the guards will stay where they are put. A Safety meeting in an industry should be considered as a meeting of first importance and you will soon learn that where safety work is considered as work of serious importance the men in the plant for whose benefit this work is largely conducted, will follow in complete harmony with this program.

Does This Strike Home?

Finding of Federal Trade Commission Reports Pacific Coast Association Violating Law

THE Federal Trade Commission has issued findings of facts and an order in the case against the Pacific States Paper Trade Association and various local associations of wholesale dealers of paper and paper products located in the Pacific Coast territory. This case was submitted to the Commission upon a signed stipulation of facts entered into by the various associations upon which oral argument was had before the Commission.

The Commission finds that these local associations and their members are engaged in fixing prices for their products in a manner that restrains, limits, and lessens competition in interstate commerce. The members of the associations named in the order are found to sell approximately 75% of the paper and paper products in the Pacific territory, exclusive of roll newspaper. The local associations named as respondents in the order are: Seattle-Tacoma Paper Trade Conference; Spokane Paper Dealers; Portland Paper Trade Association; Paper Trade Conference of San Francisco; and Los Angeles Wholesale Paper Jobbers' Association. provides that—

Eight Conclusions

Findings of the Commission contain eight conclusions of unfair practices on the part of these associations. The order to cease and desist is confined to these eight conclusions. The order provides that—

(a) The Spokane Paper Dealers discontinue fixing prices for paper in interstate commerce.

(b) The Spokane, Portland, San Francisco and Los Angeles associations and their officers and members, cease and desist from using the association price lists or other uniform price devices for soliciting or making sales in interstate commerce.

(c) All of the respondent local associations cease and desist from compiling, printing and distributing price lists which fix prices for shipments of paper in carload quantities known as "mill shipments" from one state to purchasers in another state.

(d) The Seattle-Tacoma, Spokane and Portland local associations and the Pacific States Paper Trade Association and their members, cease and desist, through the mediums of the so-called Northwest Paper Dealers or in any similar manner, from "discussing uniform terms, discounts and prices, agreeing upon prices by resolutions or otherwise, or employing any similar device, which fixes or tends to fix the prices at which paper or paper products shall be sold in interstate commerce, or which is designed to equalize or make uniform the selling prices, terms, discounts or policies of such respondent jobbers in the sale of paper or paper products in interstate commerce."

> *A MOOT SUBJECT*
>
> ***This article is an indication of how the government stands on the association question. It is the report of the Federal Trade Commission, practically in its entirety. Association cannot fix prices or appear to fix prices. That is certain. PAPER is publishing this article because it is extremely apropos to the recent ruling of Attorney General Daugherty on association work.***

(e) All of the respondent associations and their members cease and desist from conspiring or combining to hinder or prevent by intimidation, coercion or any similar means, the American Writing Paper Company or any other manufacturer from making sales of paper or paper products at any price or upon any terms such manufacturer may select.

(f) and (g) All of the respondents cease and desist from combining or conspiring in any way whatsoever to hinder or prevent any wholesaler or dealer from purchasing paper in interstate commerce directly from the manufacturer or from any one else selling or desiring to sell such product, or from seeking to hinder or prevent by intimidation or coercion, withdrawal or threatened withdrawal of patronage, any concern from buying or selling paper in interstate commerce at any price or term which may be agreed upon between the seller and purchaser.

This Was the Method

Method by which the respondent sought to control the distribution of paper in the Pacific coast territory and control prices therein was as follows:

All of the five local associations published and distributed price lists compiled by suitable committees of the respective associations. Agreements exist between the members of each local association for the maintenance of these prices within the state in which the association is located. Each association has provisions in its by-laws for the maintenance of these prices; some of these provide for a submission of reported infractions of selling regulations to the secretary for suitable action, which may consist of fines, reprimands, etc. All of the price lists contained fixed prices for carload shipments of paper under what are designated as "mill shipments," which include shipments to customers in one state from mills located in another state. While the agreements with reference to the association price lists were made for sales within the state in which the association was located, such members of the association as did business without the state habitually carried the association price list and used same in quoting prices and making sales without such state.

Each local association has a certain territory which is naturally contributory to it, and in which its members have an advantage over those of other members in the sale of their products. Wherever two associations were located in the same state, agreements were made between these associations definitely dividing the territory. These agreements also extended to the matter of prices and solicitation of business. Such division existed in the State of Washington between the Seattle-Tacoma and Spokane Associations, and in the State of California between the Los Angeles and San Francisco Associations. Further unification was brought about through regional meetings. The two associations in California met together as a California group. The three associations of Seattle-Tacoma, Spokane and Portland met as the Northwest Paper Dealers.

The associations and the members acting jointly and in concert attempted to confine the distribution of paper to what they termed legitimate channels of distribution and to induce or compel manufacturers to sell only to so called "legitimate dealers." In seeking to carry out this policy they made use of the boycott, threatened boycott and promises of increased patronage of manufacturers. The wholesalers who were designated by the respondents as legitimate were entitled to membership in the local association and the Pacific States Paper Trade Conference. The so-called "illegitimate dealers" were not admitted to membership.

In 1920, an effective boycott on the part of practically all of the respondents against the American Writing Paper Company of Massachusetts, was carried out, the effect of which compelled the American Writing Paper Company to adopt the practices demanded by the respondents. The findings state that the American Writing Paper Company shipped a large stock of paper to San Francisco and proceeded to sell it direct to the retail trade and to users of paper, and also fixed prices at which this paper was to be sold by wholesalers; the prices so fixed being lower than those established by the San Francisco local associations. All of the respondents who dealt in fine paper objected to this practice on the part of the American Company and boycotted the products of the Company. Subsequently an agreement was made with the American Company which was satisfactory to the resopndents.

AUSTRIAN PAPER POSITION PRECARIOUS

Faced By Loss of Contiguous Markets, Industry's Prospects Are Not Encouraging

SINCE the autumn of 1922 the Austrian paper industry has been in a precarious position, says Consul H. W. Helngartner in a report from Vienna, and it becomes more evident daily that it is faced by a loss of its markets in the neighboring countries. Exports to Czechoslovakia, which in spite of the developed paper industry in that country, used to purchase many special kinds of paper in Austria, have grown exceedingly difficult owing to defensive measures on the part of the Czechoslovak industry. Yugoslavia has established its own paper industry on a special basis of protectionism, and regular business with Hungary, formerly one of the most important paper markets for Austria, has become more and more intermittant by reason of difficulties connected with transactions in foreign exchange. The same difficulties and protectionist duties hamper Austria in other eastern states, and the drop of the Polish mark has undermined business in that quarter. The economic catastrophe in Germany has also closed the German market and furthermore flooded the Austrian, as well as other markets, with cheap German products.

The prospects of the Austrian paper industry are therefore far from satisfactory, and it seems evident that a slack market must be counted upon for some time to come. Recent trade treaties with Italy and France have revived trade with those countries, but it is not of sufficient volume to offset the losses in other neighboring countries. In order to find a market for its surplus production the Austrian paper industry has been obliged to turn to overseas markets.

Taking Trip in U. S.

Michael Herb, vice president of the Westminster Paper mills of New West Minister, British Columbia, has been spending a few days in Appleton, Wis., on business. Mr. Herb is representing the company on an extensive business trip through the United States and Canada. He made the trip to this part of Wisconsin partly to see his mother, who lives at the home of the Rev. Paul Herb, at Stockbridge.

J. K. and the K. K. K.'S

Jacob Kindleberger says the five o'clock whistle is merely a signal to quit working with the hands and begin with the head.

Not so very long ago, a few minutes after five p. m., as he planned his evening sermon, Boom! went all the guns of Parchment Town right out on his front lawn.

"Now what have I done to the K. K. K.'s?" he exclaimed, getting greatly excited. "While I don't usually have much to say when I'm out, I must surely have let something slip and now they are getting even with me."

Beating the family to the front door, there was the whole klan, hundreds strong, with flaming red torches and all.

"Every bad deed I ever did since rag-picking days in Ohio," said Jacob, "came into my consciousness that moment."

"Come out and show yourself!" commanded a voice from the crowd. J. K. recognized his friends. His fears subsided and he accepted a proffered ride to the Community House surprise party on himself.

As he and his good wife climbed into the waiting auto, with its gay parchment trimmings, J. K. admitted: "Well, boys you had me scared—that's one on me."

Link-Belt Company Reduces Prices

"Production," is it is generally applied, is a wonderful thing, It is a "by-product" of machines—a consequence of the multitude of inventions that have come forward during the past forty or fifty years.

A concrete instance of what production can mean in the matter of selling price comes from the Philadelphia plant of the Link-Belt Company, where the "Cub" portable loader has been placed on a production basis and where, as a result, an initial reduction in price of over 16 per cent was made.

Now, with the popularity of the machine thoroughly proved, the Link-Belt Company still further reduces the price of this portable belt conveyor, equipped with a two or three phase, 60 cycle motor and fitted with the underneath raising and lowering mechanism to $485.00.

* * *

Make Greater Production

The Monarch Division of the Allied Paper Paper Mills are changing their cutters around in their finishing room, in order to make greater production possible. Also, in the coating division, they have torn out all their old coating machines, five in number, and are using this place for sorting. They have moved two cutters and one trimmer into this room, known as the old coating room, and are casing their paper here.

CANADA FEELS EFFECTS OF FLOODING

Angus McLean Tells His Opinion of the Year and What It Will Bring

CANADIAN manufacturers of pulp and paper are feeling the effects of the flooding of the United States market by Scandinavian pulp and paper with the accompanying low prices. Angus McLean, president of the Bathurst Company, controlling pulp and paper mills at Bathurst, N. B., a concern that is controlled by United States capital speaks thusly on this question:

"There are very large supplies of foreign pulp coming from Scandinavian countries, and this pulp is being sold at ridiculously low prices so that the Canadian manufacturers of pulp today are really manufacturing and selling their product under cost, in trying to meet this foreign competition. If this thing continues there is no future whatever for the pulp business and conditions for this year will look anything but hopeful. There is only one thing that may alter the position and that is if the United States continues to boom and our friends in the Scandinavian countries make up their minds that they cannot continue selling their pulp at the ruinous prices that have prevailed for the past year.

"The only remedy for us as producers is to inaugurate so efficient an organization that we can cut down our cost of production. But this can only be done by a general lowering of costs all around. This would include wages, and other expenses such as taxes and compensation. These must be reduced to the very lowest basis. My slogan for 1924 would be 'efficiency, and more efficiency and still more efficiency.' We cannot emphasize this too much. We must have a material lowering of costs of production in order that we can sell our products and meet this competition, and still make a profit. At today's cost of production it is not possible to do this. The cost of this winter's cutting and logging will be heavier than that of last winter."

The Bathurst Company is one of the most important pulp and paper manufacturing concerns in eastern Canada. Majority control of the board of directors is with United States pulp and paper men, most of the eastern and New England states being represented on the directorate. The company owns vast tracts of pulpwood lands, and has built tidewater docks, and a hydro-electric development station on the Nepisiguit River, this power service to operate the company's plants.

Pine Seedlings Grow Rapidly

Southern pine seedlings require an oversized bed in the nurseries of the Great Southern Lumber Company at Bogalusa, La., where the Southern Forest Experiment Station of the U. S. Department of Agriculture has for some time been permitted to carry on investigations in nursery practice and reforestation.

Because of the large size obtained by the southern pine seedlings in a year's time, the sides of the frames around the beds have been made from 12 to 14 inches deep, as contrasted with the 4-inch frames used in most other localities.

* * *

Taking Risks

The city editor was looking over the new reporter's manuscript.

"I notice," he said, "you use the phrase 'puzzled to death.' I should like to have you tell me how a man can be puzzled to death."

"Well, he might be 'riddled with bullets,'" answered the new reporter.

That nearly cost him his job, but his youth—and his good record up to that time—saved him.—*Chicago Tribune.*

PAPER PRODUCTS

Conducted by J. E. Willert

FIBOPAK IS MAKING NEW CONTAINER

Chance Part of Surplus Box Board May Be Used

THE situation created by the surplus mill production of the box board, which is now estimated as high as 30%, will be much remedied by the successful manufacture and distribution of new products, in the opinion of leaders of the industry.

The line of the Fibopak Company, 400 N. Michigan Ave., Chicago, represents an encouraging movement in this direction. The Fibopak container is a seamless, waterproof box, or basket, made of paper board. It is a laminated structure composed of several blanks, which are folded into shape, placed together with adhesive between the layers, and compressed into finished form under great pressure. The walls and botton are integral and the material and strength to resist stresses are proportioned in conformity with the structural design. For most purposes they are waterproofed after completion by impregnation with paraffin wax.

According to the wish of the purchaser, the covers are either sealed directly to the side walls of the box, or are held in place by wire fasteners which permit of field closing of baskets, accommodation to "bulge" pack, and ready examination of contents without destruction of covers or fasteners. This latter feature is a very valuable one in connection with the shipment of products which require inspection upon arrival at destination.

In the shipment of fruits and vegetables the Fibopak container undoubtedly has its greatest field for usefulness. This is true not only with respect to the shipment of these products from farm and orchard to point of consumption, but also in connection with their deposition in cold storage warehouses. In addition, the container can be successfully used for the shipment and storage of plants, fresh fish, meats, candy, hardware and many other products. Also, it can fill miscellaneous needs such as display and delivery baskets for stores and carrying baskets for use in factories.

The Fibopak container, of course, will have to compete with the old style wooden containers in all these fields. It cannot be produced for less than the wooden containers, in most cases, however, the other advantages are such that in the long run, through increased sales, better prices and less breakage, it really comes at a lower price. Fibopak is lighter, and therefore the freight charges are less. It is easier to handle in the field, since there is no nailing. It is easier to load, transfer and stack, which means a saving of money in warehouse charges. It protects contents much better in storage, since it is possible to stack the containers much higher without crushing bottom layers. It protects contents better in transit. (This has been proven by nation-wide tests on long hauls and many transfers with various commodities.) It lends a better appearance to the product in the retail market, making it possible to get better prices.

The Fibopak Company is a Delaware corporation with 100,000 shares of no par value common stock. The company started its operations January 1st under a license agreement with the patentees giving it the exclusive right to manufacture and sell the Fibopak packages covered by these patents.

Julian Armstrong, well known to the paper mill and supply trade for many years, has entered into a contract with the Fibopak Company to sell its 100,000 shares of stock, and it is understood that much of this stock has already been subscribed by paper board manufacturing interests. The outlook for the success of the company is most encouraging, according to Mr. Armstrong, and in this view he is supported by all of the paper board manufacturers who have gone into the merits of the proposition.

Twiller Sales Talks

When the arugment starts the sale begins. Be an argument beater, that's what a salesman is for.

An order-taker is just a camp follower. Be the pioneer and build a business.

Help your customer by knowing his customers' wants.

Don't be a confidence man, be a confident man. It makes sales.

Success consists of cleanly finishing your job. So make your sales clean.

* * *

A Step Forward

The present prosperity of the United States Steel Corporation revealed in their report for the last three months of 1923, showing an earning of nearly $50,000,000, indicates a step toward a general improvement in trade and finance.

This coupled with the reduction of taxes, which seems now certain to take place, along with the possibility of the reduction affecting the year 1923, will certainly be beneficial to the consumption of paper products, as the large amount of this business comes from the source which will be most affected by reduction of taxes.

* * *

Production Increased

The production of the Rex Paper Company at Kalamazoo, Mich., was increased by twenty per cent, according to the annual report just announced by the secretary. The machine was speeded up and a Stickless system for the automatic control of drying was installed. This necessitated speeding up of the beaters and an extension in the power plant. Both the paper mill and the coating mill are operating at full time. All officers and directors were re-elected as follows:

President, Merrill B. King; vice president, Clarence Bradford; secretary, Harry C. Bradford; treasurer, R. V. McCulfor; directors, all the officers and Helen R. King, Kalamazoo; H. H. Creamer, Minneapolis; and W. G. Irwin, Columbus, Ind.

MAKING TOYS OF FIBER NOW

New Outlet for Pulp is Found by Pine Tree Company

MANUFACTURE of fibre toys at South Gardiner, Me., is rapidly becoming an important industry and furnishes a valued outlet for a part of the pulp of the Pine Tree Pulp Company which started business in that city two years ago. Dolls, teddy bears, rabbits and similar articles are being turned out in quantities and are largely used in supplying the demand for carnival toys.

The concern obtains sufficient pulpwood on the Kennebec River to supply it for at least ten years, all contracts subject to renewal assuring a supply of 6,000 cords of pulpwood per annum and this supply is augmented by supplies picked up on the river from other sources. Business is steady, and because it receives its power from the Central Maine Power Company, it is not dependent upon water power.

By shipment from docks alongside plants, goods are laid down for New England customers at $6 as against $10 to $15 from Canadian mills.

* * *

Collins Buys Firm

The Union Cordage & Paper Co., 312-14 South Eighth Street, St. Louis, Mo., has been purchased outright by Joseph P. Collins, who has for years been a Department Manager of the Graham Paper Co. Associated with Mr. Collins, and part owner is H. J. Collins, who was also connected with Graham Paper Company for several years, in the capacity of salesman for their Kansas City branch house.

The experience and training that both owners have had in the paper jobbing business brings to this concern a most valuable asset.

Joseph P. Collins is a brother and H. J. Collins the eldest son of Martin J. Collins, Vice President of the Graham Paper Company, who has been connected with this concern for forty years.

They will handle Toilet Paper, Towels, Wrapping Paper, Bags, Twine and Paper Specialties.

* * *

New Kraft Mill

A new paper mill with a capacity of ten tons daily will start operations on May 1, at Merrill, Wis., according to present plans of the officers of the Kraft Paper Company. Buildings under construction for the new plant, which will be located at Tomahawk, are gradually nearing completion and machinery is being installed. The company owns several other paper mills in central Wisconsin.

* * *

Continental Paper to Sell Bonds Soon

Continental Paper and Bag Mills, Inc., which is controlled by International Paper Company by majority of stock ownership, is expected to do new financing by issuing $6,000,000 twenty-year first mortgage bonds to be offered in this market shortly.

This and That in Paper Products

The Paper Bag Manufacturers on January 29 announced a 10% advance on bags.

* * *

In conversation with some of the representatives of the leading mills the feeling is apparent that because business is coming in good volume there is every reason to be optimistic about the future.

* * *

The Union Bag & Paper Co., have established a Western Sales Office in Chicago and Arthur B. Collins, formerly manager of grocery sales in their New York Office, is now manager at Chicago.

* * *

The Fonda Container Co., of Utica, New York has filed notice of an increase of capital from $75,000 to $150,000.

* * *

Mr. J. E. Schorsch, of Schorsch & Co., paper bags, New York City, is now in Florida and will return in two weeks, when Mr. H. Kurniker will go to Florida for four weeks. They report a very firm condition in the paper bag market.

* * *

A new corporation by the name of Wamsco Paper Products Co., Inc., 214 Fulton Street, New York City, Irving Wamsker, President & Treasurer, Charles Wamsker, Vice President has been formed. They will manufacture adding machine paper, index cards, etc.

* * *

The Public Service Cup Company, of Brooklyn, N. Y., report a fine demand for their Lily Cups and dishes. New sizes and packages are being added in response to a continuous demand.

* * *

Mr. Jesse Newman of the Paper Utilities Co., Inc., 220 Fifth Avenue, N. Y. City report that they are introducing new lines that are very much in demand with the Soda Dispensers.

* * *

Demand Glazed Paper

Increase in the demand for machine glazed paper is seen in the orders placed with the Beloit Iron Works of Beloit, Wisconsin, makers of paper machines for special types of machines from mills engaged in the manufacture of that commodity. New mills making this grade of paper have come into the market during the past year, and at the present time the above company is working on three such machines to be shipped to different producing regions.

Machine glazed papers are made in sulphite and sulphate, and some are made partly of sulphite and groundwood. This grade is highly finished on one side, the other side being rough finish.

Comparison Competition Cooperation

By J. E. Willert

WE live by comparison, our conclusions are reached, our judgments are formed, our decisions are made all by comparisons.

It would be impossible to know whether a thing was small unless you had something big to compare with it, whether you were moving fast unless there was something slow or permanently fixed to decide by, whether a quality was fine unless there was a coarse quality to judge by, or to reach a conclusion in the reverse.

Beauty is created by ugliness, joy by sorrow, brightness by dullness and so on all through the gamut of life's movements.

Drab would be existence were it not that changes were continually happening, ambitions were incited, uplifting of thought and grasping for better things daily taking place.

This urge for betterment caused competition, the passion which makes one endeavor to outstrip and go beyond his fellow.

The whole fabric of business is saturated with competition caused by comparison of quality, of service and of attractiveness.

Applying the test of comparison to the commodities offered for sale, the buying public compel a competition of quality, service and attractiveness among manufacturers and storekeepers.

Manufacturers wrap around their product every incentive within their power to induce the storekeeper to purchase from them. Storekeepers recognizing the comparisons made by the public compete in the privileges of comfort and ease in shopping that they offer.

Proper comparison brings about healthy competition.

There is, however, a malignant condition fastened in our industrial body, it is hidden and subtle, it resorts to the camouflaging of quality by seeming attractiveness, it studies to mislead by deceitful representations of service, trusting to the forgetfulness of the people to enable it to come again. Lacking responsibility it is without fear, vagrant in its movements it has no necessity of stability—a derelict full of danger.

Cooperation is the policeman that will remove this bandit of business. Stability linked with responsibility compelling fair representation, inviting just comparison and equitable competition will completely outlaw and imprison crooked dealing.

Large industries have joined hands in associations, cooperating for the elimination of unfair methods in dealing, the improvement of qualities and service, the inspiration of confidence and the establishment of a fine dignity.

It was said in the olden day, "No one of us lives to himself." This is an undeniable truth. The hermit life is contradictory and degenerating, this is true both in individual and business life.

The influence that goes out from an individual, fraternity, business firm or corporation is either for good or evil. It creates a positive condition that has to be met by a counteracting condition and the evil or the good will win according to which is the most powerful.

Cooperation is the harmonizing and synchronizing of the separate influences that go out so they will develop into a community of interest that will bring a positive good to all.

A fair comparison engendering a healthy competition governed by a fine cooperation causes an unlimited growth to any industry.

RECALL CLOSING ORDER WHEN POSTED

Nashwaak Pulp and Paper Company Will Keep on Operating Full Time

ALTHOUGH a notice was posted in the pulp mill of the Nashwaak Pulp and Paper Company, a subsidiary company of the Oxford Paper Company, that the mill would operate four days weekly, the order was suddenly cancelled. Several large orders were received, that will keep the mill operating on full time for at least another month. This mill was shut down for three months, during the spring and part of the summer, and during the idle period repairs were made to much of the equipment. The pulp and paper mills of the eastern Canada district seem to be bearing up under the slump better than the mills of Maine and northern New England. In a number of northern New England mills, operation on a part time basis have been in effect for several months, and indications are for a continuance of the part time operation for another month at least, in some instances.

All of the eastern Canadian mills are operating on full time, although it has been reported at divers times that some of the mills would be placed on part time. No shutdowns are anticipated. The smaller pulp mills seem to be prospering, there apparently being a ready market despite the influx of Scandinavian pulp. Indications are that a movement by concerted effort in coping with the foreign competition will be started in the very near future. The ball has been started rolling and the first step will be to secure a reduction in cost of production. This will mean a cut in compensation taxes as a start. A general ten per cent cut in wages is also meeted by the pulp and paper executives. It is believed that the reduction of compensation taxation and the cut in wages, would assist materially in lowering the cost of pulp production. Otherwise it is deemed hopeless to compete with the Scandinavian pulp at the figures set by the Europeans. However, some of the executives are hoping that the Scandinavian pulp producers will crack under the strain, and increase their prices, thus allowing more equal competition, by Canadian and United States pulp manufacturers. That the cost of pulp production as well as paper production in eastern Canada is too high is the concensus of opinion, among pulp and paper men. Instead of decreasing, the cost of production has increased since the deluge of Scandinavian pulp and paper started in America.

* * *

Gets Out Booklet

An interesting booklet on hand and stoker-fired turbine blowers has been prepared by the L. J. Wing Mfg. Co., of 358 West 13th Street, New York city. This is a publication of 24 pages and will be of interest to all who have use for forced draft equipment. It contains considerable engineering data, not only on the application of these blowers to hand-fired boilers, but also goes into considerable detail in discussing the application of these blowers to underfeed and chain grate stokers, showing how they simplify stoker installation. The booklet is well illustrated throughout.

* * *

Henry Lindenmyr & Sons, paper jobbers of 32 Bleecker Street, New York, are distributing among their customers attractive and useful sample cabinets, made of polished oak and mahogany woods, and containing samples of bristols, blanks, tags and blottings. These cabinets display 33 lines of paper and board, and contain almost 300 individual samples which are indexed for quick use.

NEW DEVELOPMENTS IN PAPERMAKING

Manufacture of Corrugated Cardboard

The machine which is seen in the accompanying illustration and which is patented in French Patent No. 561,918 is for the purpose of manufacturing corrugated cardboard. This machine permits the manufacture of all sorts of corrugated papers as well as cardboard in a single operation.

Ordinarily two machines are required for this purpose, as the corrugations may be simple or double. In other words the simple corrugated paper consists of a sheet of corrugated paper which is glued to a smooth sheet, while the double corrugated paper consists of a sheet of corrugated paper glued to two smooth sheets of paper, one on either surface. One operation consists in giving the sheet of corrugated cardboard a single surface by gluing a single sheet of smooth paper on it, while a second machine is required to glue a second sheet of smooth paper on the opposite side of the corrugated sheet.

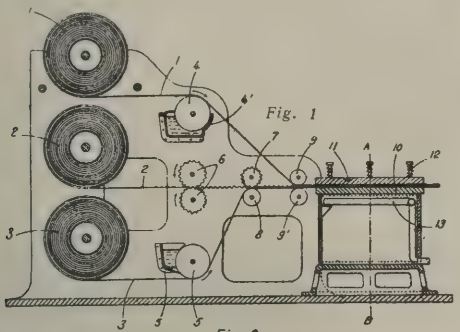

Fig. 1

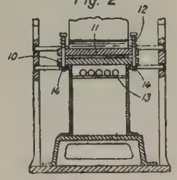

Fig. 2

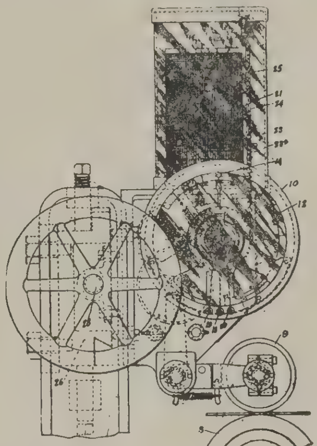
In the present invention these two operations are carried out in a single machine. The machine consists of a suitable superstructure for holding three rolls of paper, as shown at 1, 2 and 3. The paper sheet which is unrolled from roll number 1 is glued on its under side by passing over the roller 4 which turns in a glue bath 4′. In the same manner the sheet of paper which unrolls from the roll 3 is glued on its upper side by means of the roller 5 which turns in the glue bath 5′. The sheet of paper from the roll 2 passes between two channeled or grooved rollers 6 which gives it the well-known corrugated form. The three sheets of paper are then passed between the rollers 9 and 9′, then it passes over a press 10 which is heated in a suitable manner. Thus for example it may be heated by means of a row of burners as in 13.

The three separate layers of paper are pressed together on the press 10 by means of the plate 11 and the pressure is regulated at will. This can be accomplished by means of the screw bolts 12.

As can be seen from the giure it may sometimes be desirable to exert a preliminary pressure on the sheets 2 and 3 before the three sheets are pressed together to form the finished product. This is accomplished by arranging a pair of rolls 7, 2 in front of the rollers 9, 9′. Of these rollers 7 is grooved in such a manner that its grooves fit into the corrugations that have been produced by the rollers 6. The roller 8 has a smooth surface.

Paper Manufacturing Process

The machine that is seen in the accompanying figure illustrates a process of manufacturing paper which is patented in United States Patent No. 1,479,786. This process consists in delivering the raw material to the wet end of the machine in substantially the quantity required to form a paper web of predetermined thickness. The web that is formed in this manner is caused to come in contact with a metering instrument so as to actuate the same to produce indications to make a record of the mean thickness of the paper showing the plus and minus variations therefrom. In this way the thickness of the paper is automatically regulated.



Purificaton of Cellulose

The process which is patented by Dr. C. G. Schwalbe in German Patent No. 379,268 is concerned with the purification of cellulose and the change which is thereby effected in its physical properties and is an addition to a former patent, German Patent No. 369,606.

The process in the latter patent is modified in that the cellulose or half-stuff is first heated with oxidizing agents, then thoroughly washed, and heated under pressure at a temperature of approximately 100 degrees C. for an increased period with solutions of the alkaline-earth, magnesium oxids, or the like. Suitable oxidizing agents are nitric acid, nitrous acid, hypochlorous acid, permanganates, perchlorates, perborates, sodium peroxide, hydrogen peroxide, sodium hypochlorite, bleaching powder.

As an example cellulose is heated with a half a per cent solution of nitric acid to a temperature of from 30 to 40 degrees C. for a period of two hours. Then the acid is thoroughly washed out of the cellulose and the product is neutralized with excess of lime water for eight hours at a pressure of four atmospheres, as described in the main patent. The product is cooled and washed and any lime present is neutralized with acid. The treatment with the oxidizing agents alters the exterior of the cellulose not only by oxidation but also by hydrolysis, and facilitates the purifying action of the alkaline-earths.

Satin White for Coating Paper

United States Patent No. 1,470,765 describes a process for the manufacture of satin white for coating paper. A solution of alum is added to hydrated lime and the mixture is thoroughly ground in a pebble mill. Water is then added to produce a comparatively thin suspension which is allowed to settle, the excess of water being drawn off. Size, glue or the like is then added, together with some caustic soda, and the whole is reground. A satin white which is completely free from grit is obtained in this manner. If it is not to be used to coat paper immediately, the size is not added but the paste is filtered on a vacuum filter and the residue is dried. When required it is mixed with twice its weight of water, treated with size and alkali, and reground.

PRODUCTION DROPPED 7 PER CENT IN DECEMBER

However the Drop is Seasonable and Was Not Unexpected Report Says

PRODUCTION of paper by identical mills reporting to the American Paper and Pulp Association and cooperating organizations showed a drop of about 7 per cent in December from the November production, according to the monthly statistical summary of the paper and pulp industry. This drop in the last month of the year is seasonal and was smaller than anticipated.

The tonnage summary is prepared by the American Paper and Pulp Association with the cooperation of the Binders Board Manufacturers Association, Newsprint Service Bureau, Tissue Paper Manufacturers Association, Wrapping Paper Manufacturers Service Bureau and Writing Paper Manufacturers Association. The figures for December follows:

Grade	Number of Mills	Productions Net Tons	Shipments Net Tons	Stocks on Hand, End of Month Net Tons
Newsprint	66	117,790	116,826	23,669
Book	63	59,446	61,006	27,019
Paperboard	107	84,646	82,787	34,082
Wrapping	85	41,579	35,744	55,197
Bag	31	6,445	6,851	6,394
Fine	85	28,921	20,011	39,530
Tissue	46	9,022	8,270	8,829
Hanging	10	5,376	5,765	2,870

Manufacture of Compound Paper Sheet

A non-splitting duplex of compound paper, which, when coated on one side only, as in the manufacture of art paper, etc., does not curl, even after immersion in water and re-drying, is made by uniting, by means of a water-insoluble adhesive, such as tanned or formalized gelatin, or rubber solution, a newly-formed wet web of sized or unsized paper with a sized or unsized sheet which has been dried and finished in the usual manner. The two webs, after interposition of the adhesive, are superimposed and passed through the ordinary wet presses or through a special press before or between the drying cylinders, depending largely on the character of the coating composition which is to be applied subsequently.

For example, the greater the tendency of the coated paper to curl, the higher should be the moisture content of the wet web when the compound sheet is formed. If desired, the adhesive, for example, gelatine solution, may be applied to and allowed to dry on one side of the dry web, so that the compound sheet is cemented together during its passage over the drying cylinders.

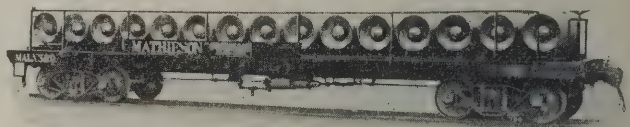
In a modification of the process two finished dry webs, both fully sized or of different degrees of sizing, may be united together by a waterproof adhesive to give a non-splitting duplex paper or one of the sheets may be moistened with more or less water before being stuck to the dry sheet to produce a paper which will not curl when subsequently coated. In all cases the compound paper may be after-sized if necessary, and when coated the composition should be applied to that surface of the paper which was dry when the compound sheet was formed.

This process is patented in British Patent No. 205,118 by the Associated Paper Mills, Ltd.

MATHIESON CHLORINE TANK CAR APPROVED

Interstate Commerce Commission Rules Multi-Unit Car a Tank Car

THE Mathieson multi-unit chlorine gas tank car, designed and operated by the Mathieson Alkali Works, Inc., is held entitled to the same freight rates and privileges as any tank car, by decision of the Interstate Commerce Commission. The Commission completely upholds the contentions of the Mathieson Company and the "Safety First" principles embodied in this car design. The multi-unit car assures full compliance with the law by cleansing and accuracy in loading, and greatly increases the safety factor in handling and transportation by separating the units into fifteen containers carrying exactly 2,000 pounds each, as compared to a single unit chlorine tank car which carries fifteen tons in a single tank. The requirements of the law that containers carrying chlorine must be loaded on accurate scales, and approved plant practice of thorough cleansing and inspection of each container at the manufacturer's works is, with certainty, observed by this type of equipment. The reduction of the hazard is also an important factor. The certainty of the consumer that he is getting exactly 2,000 pounds of liquid chlorine in each container can not be accomplished by any other type of equipment.



When the Mathieson Company voluntarily went to the expense of designing and placing in service this multi-unit car over two years ago, the railroads held that it was not a tank car, and attempted to assess charges far in excess of those applying on the Class V tank car, ignoring the advantages to themselves, their employees, and the public at large from a "Safety First" standpoint. In the interest of both the producer and the consumer, therefore, the Mathieson Company appealed to the Interstate Commerce Commission that this discrimination be removed, that the industry might be able, economically, to use this equipment. While this case was pending, the Mathieson Company assumed the excess freight charges on every movement, in many cases three times the charges on a single unit tank car.

It is believed that this voluntary action is a far-sighted step in the interests of the general public safety, of the producer of chlorine, of the consumer, and of the carriers. By this favorable decision, the Mathieson Alkali Works has been upheld by the Interstate Commerce Commission, which body is responsible for the public safety in the transportation of any hazardous article. The Mathieson Company has performed an important beneficial service to the entire electrolytic alkali industry. All large chlorine consumers such as the pulp and paper industry will materially benefit in their ability to secure, in a safe, economical and convenient manner, one of their most important raw materials.

* * *

PAPER INDUSTRIES EXPOSITION

THE finest collection of watermarks ever collected is planned as an educational feature of the Second Paper Industries Exposition, to be held at the Grand Central Palace, New York, the week of April 7th, and scores of letters have been sent by the management asking mills and big corporations to assist in collecting a representative series of special watermarks, particularly those on paper made for large business organizations which have either the firm emblem, names, symbols or picturization of the firms' products marked in the paper. A good start has already been made on the collection, those already secured including a number of early religious marks, several early regal marks and quite a collection of modern watermarks in the stationery of business firms.

FORESTRY in the PAPER INDUSTRY

Conducted by J. R. Simmons, Secretary Forester, the New York State Forestry Association

PRIVATE REFORESTATION ADVANCED

Progress Is Being Made for Replacing Those Forests That Are Being Cut Down

ARTICLES have recently appeared in the newspapers and trade journals which describe in interesting detail the progress of reforestation in the western portion of the United States. The most conspicuous and comprehensive/of these is probably the illustrated article by Mason and Stevens appearing in the *Lumber World Review*, which undertakes to treat of the historical aspects of the movement as well as the present annual progress. Contrary to the opinion so often expressed by a certain element who see in the lumberman's axe and the forest fire the only real causes of timber shortage, that nothing material is being done by private enterprise, the fact is that many timberland owners, (and these include prominent paper and pulp men) have initiated and are still promoting movements looking toward reclamation. These movements are being backed up with improved methods cutting.

The term "reforestation" should be used in the broad sense, for it may be accomplished through natural reproduction as well as through artificial reproduction, and only land that has become so devastated as to be incapable of natural restoration need be reclaimed by the artificial method. We have a huge area which must be reclaimed, if at all, by artificial reforestation. We have some land, chiefly on mountain tops, that has been burned down to bed rock and which even artificial reforestation will not reclaim. While we are laboring with the great area that can and should be restored to forest growth we should stress in all places the value of working plans which will encourage the forest lands to naturally restock themselves. Nature is wasteful with her seed, but she can cast it in such great quantities and over so wide an area that the man-made forest often appears like a city garden in comparison to the natural plantation on the mountain slopes extending over an area of many square miles.

In the western United States, much the same thing has happened in relation to reforestation that took place in the East and especially in New England during the period following the Civil War. It will be recalled by the "oldest inhabitant" that in the 60's and 70's many pine plantations were made in the East, and there was a boom in reforestation. Then came the opening of the great forests of Michigan, Minnesota and Wisconsin, and for a time the partial overstocking of the lumber market. Reforestation declined for a number of years, and not over fifty mature plantations remain today as examples of that early reforestation movement. These plantations, however, give us some very valuable figures on American artificial forests, figures on which we can estimate the economic value of tree planting in the section where the plantations have been grown. PAPER published in the fall of 1923 a statement based on measurements of a dozen or more of these mature plantations. What happened in the West when the second great reclamation movement came on was, in brief, as follows: Around 1907 a large part of the privately owned timber came into the hands of the present owners, and during this time the active discussion of the imminence of a timber famine had much to do with the buying of timber lands. But the demand for western timber did not develop as had been anticipated, and about 1917 the timber owners became aware that they were carrying a decidedly heavy economic burden without the opportunity to dispose of it with profit.

There was some discussion of reforestation prior to 1920, but the idea was considered fantastic. It was recognized that reforestation in many places was necessary, but the concensus of opinion was that it should be carried on as a governmental function. The C. A. Smith Co. and later the Coos Bay Lumber Co., in Oregon, were practically the only corporations which during this time had any interest in the movement, and lack sympathy and co-operation caused even those enthusiasts to eventually drop it.

The fundamental change in the situation occurred about the year 1918 and was in considerable measure the result of the World War. The nation-wide discussions promoted by Foresters Graves and Greeley had an important bearing, and these discussions were followed by the work of various committees, private and governmental, and by the introduction of legislation with which we are all now fairly familiar.

It may be said that private reforestation in the West had its real beginning in the redwood region, and that the Union Lumber Company was the first to adopt definitely a policy of managing its lands for perpetual reproduction. This took place in 1921, and the following corporations should be credited with having followed immediately thereafter: Pacific Lumber Co., Little River Redwood Co., Glen Blair Redwood Co., and Mendocino Lumber Co.

A little later the following companies joined the movement: The Casper Lumber Co., the Northern Redwood Co., the Holmes-Eureka Lumber Co., the Albion Lumber Co., the Dolbeer & Carson Lumber Co., the Bayside Redwood Co., the Elk River Mill Co., the California Barrel Co., McKay & Co., the Metropolitan Redwood Co., Percy Brown and the Hobbs-Wall Co. In Humbolt County, California, practically all of the operators and the principal non-operating timberland owners have organized the Humbolt Redwood Reforestation Association to further the movement.

These are by no means all of the corporations that have now set themselves to the task of producing perpetual supplies, but in the pages of PAPER will be found from time to time statements in regard to the progress made by these and other promoters of private enterprise, and such information as can be given to encourage and assist those who are endeavoring to do their share toward solving one of this country's fundamental problems.

ELECTS REPRESENTATIVE MEN

Lumber and Pulp Men, and Federal Officials Are Conspicuous

THE statement of Colonel H. S. Graves, reelected president of the American Forestry Association, said that he would be forced to relinquish the presidency as soon as the legal requirements have been met was the unexpected feature of the annual meeting of the American Forestry Association at New York, January 23. A special committee headed by Nelson C. Brown had been active in preparing the program, and an attendance including the best known forestry enthusiasts of the east was recorded.

The result of the mail ballot for officers was announced as follows:

President—Henry S. Graves, former chief, U. S. Forest Service, now dean of Yale Forest School, whose new duties as provost at Yale will force him to relinquish this office.

Vice-presidents—W. W. Atterbury, vice-president Pennsylvania Railroad; Charles S. Barrett, Georgia, president Farmers Union; Daniel C. Beard, New York, National Scout Commissioner, Boy Scouts of America; John W. Blodgett, Michigan, president National Lumber Manufacturers Association; George Cornwall, Oregon, publisher, *The Timberman;* Charles Deering, Illinois, director of International Harvester Company; Samuel Gompers, Washington, D. C., president, American Federation of Labor; David L. Goodwillie, Illinois, chairman, National Forestry Policy Committee, National Chamber of Commerce; Anson S. Goodyear, New York, president, Great Southern Lumber Company of Bogalusa, La.; George Bird Grinnell, New York, explorer; William Kent, California; Mrs. Maud Wood Park, Washington, D. C., National League of Women Voters; Gifford Pinchot, Governor of Pennsylvania; Filibert Roth, Michigan, former dean of forestry, University of Michigan; Harvey N. Shepard, Massachusetts, president, Massachusetts Forestry Association; B. H. Snell, New York, member of Congress; Henry Van Dyke, New Jersey, author; Henry C. Wallace, Iowa, Secretary of Agriculture; John W. Weeks, Massachusetts, Secretary of War; William Allen White, Kansas, editor; Mrs. T. G. Winter, Minnesota, president, General Federation of Women's Clubs.

Directors—Ernest B. Dane, Massachusetts, and George H. Myers, Washington, D. C., for one year; Justin R. Swift, Pennsylvania, for three years; William P. Wharton, Massachusetts, for four years; Joseph H. Pratt, North Carolina, Mrs. John D. Sherman, Illinois, and Henry W. Shoemaker, Pennsylvania, for five years.

Treasurer—George D. Vass, Washington, D. C., vice-president Riggs National Bank.

Announce New Color

E. I. du Pont de Nemours & Company announces the development of a dyestuff known as Lithosol Claret B. It is used by the lake trade in the preparation of maroon lakes for paint and color varnish, printing lakes, and in pulp lakes for wall paper and coated paper.

New Forest Association

A drive is to be made in the State of Wisconsin during the month of February, at the end of which time the charter will be closed, to get all of the pulp and paper mills of the State represented in this new forestry Association.

The membership fee is based upon the consumption in cords or per 1000 log feet consumed by any one mill during the previous year, which for the purpose of membership at the present time would be 1923.

There are now represented in this Forest Protective Association a large number of the mills including all of the larger ones, except one, and totalling a consumption of over 600,000 cords per annum.

Three of the State Commissions are very much interested in this work and at the present time there is a bill in the United States Senate, presented by Senator Charles McNary of Oregon, which if passed and proper legislation is passed in the State of Wisconsin will bring about in a short time the replenishing of the State's wood supply and insure the present pulp and paper mills in Wisconsin a continuous supply of the proper grades of pulp wood.

It is part of the work of the Wisconsin Forest Protective Association to aid in the bringing about of proper education and legislation to the end and with the aid and interest the State officials are taking in this important work to keep Wisconsin in its present position in the wood producing industries of the United States. Such end is assured if all those in said industries who should be interested will help by putting their shoulder to the wheel.

The Madison section of the Society of American Forestry located in Madison, Wisconsin, is doing its part to bring about the desired results and working not only with United States and State officials but also with Mr. D. C. Everest, President of the Wisconsin Forest Protective Association.

* * *

Mississippi Declines Reforestation Bill

Economy was the authorized destroyer of the reforestation bill, which died, as it did two years ago, in the Mississippi state legislature. The bill proposed fire prevention, reforestation and a state survey of the conditions, the cost of the work to be met by a tax on the lumber cut. The legislative committee decided against the bill on the ground that it provided new jobs, while the legislative policy is to economize in existing state expenditures, and not incur new liabilities.

* * *

Canada Provides Trees

The reforestation movement in Canada which has centered largely in the large pulpwood producing regions, is being extended to other portions of Canada. At Welland, Ont., it was announced, for instance, that the government will provide free of charge enough trees to any individual to plant two acres a year for four years, this being to encourage the development of farmers' woodlots. In larger quantities the government will sell trees at $4 per thousand. For windbreaks 500 trees will be provided without charge.

* * *

Redwood Owners Adopt Policy

Progress in forestry in the redwood region of California is shown by the fact that a definite program of conservation and reforestation has been adopted by 65 per cent of the owners of redwood timber. Two companies have established private nurseries for the reproduction of timber in the redwood belt, and the barren wastes will become fine forests of second growth. Meanwhile, several fine stands of the primeval giants are being saved for permanent forest parks.

JACK PINE INDUSTRY IS SPEEDING UP

Most Despised of Trees Is at Last Coming Into Own

THAT most despised of all trees, the scrub of the Wisconsin forest, a type of timber looked upon for years as worthless, Jack Pine, has at last come into its own.

The Kraft pulp and paper mills of the State have at last found a method of working up this kind of timber into a very strong paper, the equal of that foreign paper known as Kraft which originated in Norway or Sweden some eight or ten years ago.

Many new Kraft mills have been built in the Southern States during the past few years to use the big long leaf and other varieties of Southern pinewood, but the paper made from this Southern fast grown fiber does not compare with that made from Wisconsin Jack Pine according to the pulp experts who have worked in both grades of timber.

There are now four Kraft pulp mills in Wisconsin, two in Michigan and one in Minnesota. There are now in course of construction one in Michigan and one in Wisconsin, making a total of about 350 tons per day and when the new mills are completed this will be increased to very nearly 450 tons every 24 hours.

Other woods are used in the manufacture of Kraft Pulp in these States, namely hemlock, balsam, spruce and tamarack; but Jack Pine is now used in greater quantity than any one of the others for this grade of pulp.

The farmer who has kept a wood lot now knows the wisdom of his action. Many the sand farm in Central Southern Wisconsin which otherwise would be an entire failure, pays its owner good returns from this winter crop of Jack Pine timber, cut and hauled to the pulp mill or railroad siding at a time of the year when he has nothing to do on the farm except the regular farm chores of the winter months.

* * *

Michigan and Minnesota Compete

Minnesota is 30 years ahead of Michigan in its forestry possibilities according to a statement prepared by specialists of the Lake States Forest Experiment Station, after a study of the conditions. But the investigators have expressed themselves rather more bluntly: "Michigan has 30 years the start of Minnesota in the destruction of its forestry resources." In Minnesota there are fine stands of jack pine, now valuable for pulpwood, but once despised, while Michigan's southern sections are lacking in this species. Reforestation in Michigan, however, is to be increased by the Federal Service, and the present rate of planting is 1,000 acres a year and will be increased to 4,000 or even 5,000 acres a year. The cost is only about $4 per acre, owing to the lack of brush.

* * *

Government Restricts Christmas Trees

The importation of Christmas trees which has been extensively discussed by those studying reforestation. has met a check from the United States Department of Agriculture, which has restricted the importation of all such trees from the regions of Canada contiguous to the districts where the gipsy moth has been working havoc. Similar restrictions are placed on interstate commerce in Christmas trees involving American states subject to the gipsy moth. This is the result of the January 4th hearing before the Federal Horticultural Board, announced in the January 2nd issue of PAPER.

New Forests for Old

Significant evidence of the value of scientific reforestation and of protecting from fire second-growth stands of timber, as shown by comparing the yield of new growth with actual cuttings of virgin forests in the vicinity, is announced by the U. S. Forest Service. In the Shasta National Forest in California a representative plot consisting of forest land cut over 35 years ago and since untouched by fire shows present yields of 4,100, 9,800 and 17,200 board feet per acre for trees respectively 25, 30 and 35 years old. The latter figures, as it happens, are almost identical with those for timber now being cut on fire-thinned virgin forest in the neighborhood, where a lumber company is engaged in logging operations. As reported in yield studies just completed by S. B. Show, silviculturist of the Forest Service, the second growth in question is understocked, rather than overstocked, and while it will never run up to the 75,000 board feet per acre figure that older, fully stocked stands in this region attain, the fact that already in 35 years it has equalled in productiveness virgin stands considered profitable for logging well illustrates the capacity of western yellow pine for rapid and profitable growth.

That these trees have already begun a ruthless struggle for light and for crown domination is shown by present measurements. These indicate that in the last ten years height growth has been greatly accelerated, in contrast to the slower diameter growth. As this continues the result will be a natural thinning out of the less vigorous trees through their inability to exist under the dense shade of their more vigorous and so more lofty neighbors. Thus the next-ten-year period will find fewer trees with a larger average diameter and the yield for all trees distributed more profitably among those of greater girth.

* * *

Forest Succeeds Wheat Field

There is a fine illustration of the possibilities contained in abandoned farm lands in the production of profitable forest crops to be found near Chestertown, N. Y. About half a mile west of the village there is a piece of land known as the Remington lot which during the Civil War was cultivated and growing wheat. There was a fringe of old growth white pine trees around this lot. The year after the Civil War the price of wheat did not pay for raising it, and the owner of the land let it go back. White pine gradually seeded in this forty acres until the whole area was covered with a natural heavy reproduction.

This lot now is visited by about every group of foresters that comes into the Adirondacks, for after fifty-seven years, there is a magnificent stand of clear, bold, tall white pine with diameters running from 10 to 21 inches and heights in many cases over 100 feet.

In the summer of 1923, several quarter-acre plots were measured to get an estimate as to what the stand would show in board feet. One plot showed a stand per acre of 67,120 f. b. m. and another 56,400. This is a remarkable stand of white pine as the seeding in and growth have all taken place within fifty-seven years. Many of the trees show an annual growth year after year of three feet in length.

* * *

Howe Heads Canadians

The annual meeting of the Canadian Forestry Engineers resulted in the election of Dr. C. D. Howe of the University of Toronto as president; G. H. Prince, New Brunswick provincial forester as vice-president; J. R. Dickson, Dominion Forestry Branch as secretary and Clyde Leavitt, Board of Railway Commissioners, as treasurer.

News from New England

TWO-THIRDS OF NORMAL CUT THIS YEAR THROUGHOUT MAINE

Great Northern Paper Company Will Have a Cut of 200,000 Cords for the Season

THE pulpwood cut in Maine for the season 1923-24 will be but about two-thirds of the normal cut, the shortage in cut being because of the large reserve brought over from last year, rather than because of any unfavorable conditions in logging. In fact the conditions to date have been unusually good. There has been sufficient snow and not too much and there has been plenty of labor available and at present at a lower rate than has been the case since the war.

The season's cut of pulpwood by the Great Northern Paper Co. will be approximately 200,000 cords, which is a falling off of 400,000 cords from the cut of last season. The Great Northern, and in fact most of the companies operating in Maine have been carrying over large quantities from other seasons but have been using the reserve, doubtless in the belief that expenses of operation will lessen. In the early fall wages for woods laborers were up to $3 a day but since Jan. 1 there has been so great a supply of labor that the price for common work in the woods has dropped to $2 a day.

The Great Northern at present is employing less than the usual number of men and horses, having about 2,500 men on the payroll and 1,500 horses. A number of tractors are being used in the woods by the company and while Fred A. Gilbert, general manager of woods operations and timber lands says their use does not show any saving in expense, there is an advantage in the matter of employment of men. The company is using 900 horse power in tractors and a man with a tractor can do more work than a man with a team.

The Great Northern mills are running at full capacity with the exception of the plant at Madison where changes and improvements are being made, but one machine being in operation.

The increasing demands of the Great Northern mills at Madison had outgrown the old hydraulic development and more than a year ago the start was made on a new hydro-electric plant which has now been completed. A canal has been dug connecting the dam and power house, a large amount of excavating being necessary. A reinforced concrete guard wall has been put diagonally across the canal to catch debris and sheer it away from the power house. A mechanical raking device has been installed for cleaning the trash racks.

Five turbines set on vertical shafts, each of 1,500 h. p. have been arranged for each driving a 1,500 k.v.a. electric generator. Only four of the five units have been set, these supplying all the power needed at present; but the fifth will be held in reserve. Each turbine operates under a head of 20 feet. They are the high speed type, guaranteed to give 90 per cent efficiency; and are set in flumes of the scroll type, built of concrete as is the whole substructure of the power house.

The generators are also placed on vertical shafts and two of them have at the upper end of the shafts, exciters for starting purposes. There are, furthermore, two motor generators set on the floor for exciting the main generators under ordinary running conditions.

The switch board is in the gallery floor. The main switches are located in a room above the gallery. A storage battery is used in operating the switches when starting. It is from this room that the 23,000 volts are transmitted across the river to the mill. The power house is 189 feet in length. The flume gates and trash racks are housed in a gate house adjacent to the generator room.

The design of the enterprise was made by Hardy S. Ferguson of New York and is the latest in hydraulic and electrical evolution. The construction has been under the supervision of E. W. Prouty, the local engineer. The electrical equipment has been furnished by the General Electric Co. and the turbines were built by William Camp & Sons Ship and Engine Co. of Philadelphia.

* * *

Paper Market Improves

Heavy buying of paper stock in New England by New York and Connecticut mills has resulted in a decided improvement in the paper market in Boston and other New England points and a slight increase in prices. Mixed paper and folded news were in greatest demand with $13 for mixed and $18 for news being paid. Most of the news was consigned to Connecticut. As a result of the demand, prices went from $12.50 to $13,00. Even $13.50 was paid in some instances. Books has remained at $1.75 to $1.85 with a few sales reported at $1.90. Soft white shavings are obtainable at $2.75 f.o.b. Boston and No. 1 Manila papers are bringing $1.70 to $1.75 shipping point.

Unbleached and kraft pulps show no important improvement in prices. Fair unbleached pulp sold to a New England mill brought 2.55 and a little higher grade Scandinavian pulp brought 2.65. Fair krafts are bringing 2.50. Easy bleaching sulphites show improvement at 2.90 docks and are as high as three cents for best grades. Norwegian ground woods are available at $33 per ton docks at Boston.

Mrs. Connable Dies

Mrs. Julia K. Hosford Connable, who died in Paris early in the week, was the wife of Frank Lee Connable, vice president of the du Pont Powder Co., and the daughter of Isaac B. Hosford, organizer, with others, of the International Paper Company and organizer and president of the St. Croix Paper Company, who resides in Chapel Hill, N. J. Mrs. Connable was born in Massachusetts 40 years ago and had residences in New York, Wilmington, Del., and Miami, Fla. The remains will be brought to Mt. Auburn cemetery, Cambridge, Mass., for burial in the family lot.

HERE'S GOOD NEWS FOR THE END OF WINTER

Fitchburg Paper Mills Operating Full Time This Winter

PAPER mills at Fitchburg, Mass., are operating full time and are having difficulty in keeping abreast of orders, according to officials of the companies, which is in contrast to the mills in some other New England communities where plants are being curtailed.

At the Fitchburg Paper Company a decided improvement in business is reported with an increase in orders, with a practically normal crew at work and the mills now on full time.

The Falulah Paper Company has been operating its mills with full crews since January 1 and conditions are said to be brighter than at any time for many months.

Crocker, Burbank & Co. mills have been operating with a fair sized crew, the entire crew being retained at full time. Officials declare the 1924 outlook to be the brightest in years, with better business all round, particularly if the new changes in the federal taxes are put into effect.

The mills of Louis Dejonge & Co. are running full time but with a crew slightly below normal, and have been so operating since last July. They expect to put a full crew at work within a short time.

* * *

Making Repairs

General repairs, renovations and improvements are being made by a special crew at the plant of the Skowhegan Paper Company's plant at Skowhegan, Me., preparatory to reopening the mills. The mills closed several months ago but orders are now on hand so that it is planned to open with a slightly less than normal crew which it is expected will be increased to a full crew to operate full time.

* * *

Increases Its Capital

The Uncas Paperboard Company, Inc., of Norwich, Conn., has been granted an increase in its capital stock to $1,350,000 by issuing 13,490 additional shares of stock. The company plans upon making extensive enlargements and will greatly increase its production.

* * *

Ice Holds Up Work

Work at the plant of the Westfield Paper Company at Woronoco, Mass., has been more or less unsettled owing to the large flows of ice in the river from which the company derives its power, interfering with the operation of the mills. On two occasions recently it has completely cut off power for operation for two or three days at a time.

* * *

Director of Great Northern

Sheldon E. Wardwell, prominent Boston attorney of 84 State Street, Boston, has been elected a director of the Great Northern Paper Company where he succeeds Col. E. H. Haskell of Newton, Mass., recently deceased.

* * *

Morris Manes, 138 Church street, North Adams, Mass., is planning to build a one-story paper mill, 60x200 feet, at Pownal, Vt.

The Malden Paper Stock Company, Malden, Mass., is a new corporation, capitalized for $5,000. Charles Fine and Samuel Werlin head the concern.

BUSINESS OF AMERICAN WRITING IS STEADILY IMPROVING

Bonds Being Absorbed and Decision of Federal Trade Commission Brings Optimism to Company

INTEREST in paper circles in the vicinity of Holyoke, Mass., centered about the American Writing Paper Company during the past week. The first favorable information came from a meeting of the bondholders committee that met in Boston. It was announced that approximately 55 per cent of the bonds had been turned over to the committee and a definite program of action will be announced within the next two weeks.

The decision of the federal trade commission declaring the Pacific Trade Association to be engaged in a business of price fixing and ordering the corporation dissolved, added new energy to the paper manufacturers of Holyoke especially to the American Writing Company which found competition in the west to be keen. Although the American Writing Paper Company was named as one of those entering the protest to the federal commission, S. L. Willson, president of the American Writing Paper Company denied that the company had entered any protest. Proceedings were instituted against the Pacific Trade Association early last summer and according to President Willson, the name of the company he represents may have been used to expedite matters. He denied emphatically that anyone connected with the firm had entered a protest in the name of the company.

The American Writing Paper Company has received word that their bid was the lowest for government bond paper to the volume of 4,300 tons. The Carew and Hampshire Paper Companies located in South Hadley Falls were also among the lowest bidders for government paper. The new orders are expected to keep the mills of Holyoke and South Hadley on a full week schedule for the next two months.

RE-FINANCING OF FIRM OUT

Parker-Young Company Offering $2,500,000 *Bonds Now*

THE Parker-Young Company, pulp and paper manufacturers at Lincoln, N. H., and Livermore Falls, N. H., are offering $2,500,000 first closed mortgage 6½ per cent sinking fund gold bonds for the purpose of retiring $1,282,000 mortgage notes and substantially all of the company's floating debt.

The Parker-Young Company was incorporated in 1917 and is successor to the Parker-Young Company founded in 1843. Later it also absorbed the Henry Paper Company of Lincoln. The company operates pulp and paper mills at Lincoln, N. H., and a ground wood mill at Livermore Falls, N. H., owns approximately 70,000 acres of timber land in the Pemigiwassett Valley, developed water power at Lincoln and Livermore Falls, about 20 miles of logging railroad, practically the entire village of Lincoln, N. H., and incidental properties. In addition the company and its subsidiaries own other timber lands in New Hampshire, Vermont and Florida, two modern saw mills, three mills manufacturing piano sounding boards as well as mills producing boxes, shooks, tables, interior finish and veneer.

The total net assets of the company, excluding good will and other intangible values, and its subsidiaries, shown by the consolidated balance sheet of Aug. 31, 1923, is $7,886,404 with net quick assets of $3-176,220. The average consolidated net income of the company and its subsidiaries for the past five years, after deducting depletion and depreciation but before federal taxes amounts to $815,231.

It is expected that through the new financing plan the company may make additional improvements and expand its present business considerably.

* * *

Buys New Machine

The Crown-Willamette Paper Company mill at Oregon City, Oregon, has placed an order for a large new paper machine with the manufacturers. As soon as the machine is received and installed the Crown-Williamette Paper Company paper mill at Lebanon in the same state is to receive the paper machine now in operation in the Oregon City mill. This larger machinery will enable the Lebanon paper mill to turn out paper five times as fast daily as it is doing at the present time. It is now manufacturing 20 tons daily and with the means to increase the output to five times these figures the mill will have a capacity of 100 tons daily.

With an increased capacity for the manufacture of paper the Lebanon mill will double the working force at the mill which is the largest industry of the town. The town of Lebanon will benefit by the additional workers who will be attracted to it by the chance of work in the paper mills.

The Lebanon paper mill began the manufacture of paper in 1892 and it has been manufacturing paper ever since. It has with the exception of one incipient strike some years ago the trouble being quickly adjusted, had no labor troubles.

* * *

Lets Contract

The Columbia River Paper Mills Company will extend the paper mill building now being erected at Vancouver, Washington, 100 feet on the east side and has let the contract for this additional work to the Austin Company. This firm is putting up the main paper building at the present time and expect to have it finished by March 1, 1924, and the new contract by May 1, of the same year. The size of the completed building will be 490 by 80 feet.

* * *

Unjust Rates

Freight rates on wood pulp originating in British Columbia and shipped from Seattle to the Camas, Washington paper mill between October 1, 1919 and April 30, 1921 were unjust and unreasonable the interstate commerce commission has decided. Reparation was awarded.

The Narragansett Card & Paper Co., 131 Washington street, Providence, R. I., is a new concern, headed by Harry L. LeMay of 170 Courtland street, Providence.

In the Far West

HUGE AMOUNT OF TIMBER TO BE CUT

Much Timber Thrown Open in Colorado for Cutting

WHAT is said to be the largest amount of timber ever offered for cutting in the state of Colorado, was announced by Allen S. Peck, district forester of the United States forest service, Denver, January 24. The timberland is in the vicinity of Dolores Colorado, on the Denver & Rio Grande Southern railroad, seventy-five per cent of it located in the boundary of the Montezuma national forest and twenty-five per cent privately owned.

It is yellow pine and there are 400,000,000 feet of yellow pine, and it is estimated that it will require 18 years to perform the work, there being 118,391 acres, and never before has the state offered so much timber over such a long period. Mr. Peck says:

"Since no cutting has ever been done in this area, there is a large accumulation of over-mature timber which, considered as a crop, is ripe for cutting now. None of these over-mature trees can be left at this time, since they would succumb to rot and insects before the growth of new material would justify the next cut.

Trees representing 15 to 20 per cent of the volume of the stand more than ten inches in diameter will be reserved for seed trees and as a basis for another cut, which will insure the perpetuation of the forest. When young trees of a size sufficient to be reasonably safe from fire are not present, seed trees will be saved to insure the next crop. Every tree cut will be marked by a forest ranger and the cutting will be done under his direct supervision.

"Fire breaks will be established along the logging railroad, and such other precautionary measures effected as will protect the entire region from forest fire danger."

WATER POWER & PAPER CO. ELECTS OFFICERS

Annual Meeting Held at Offices at Wisconsin Rapids, Wisconsin, on Thursday, January 24

OFFICERS and Directors of the Consolidated Water Power and Paper Company of Wisconsin Rapids, Wisconsin, who served during the past year were all re-elected at the annual meeting of stockholders of the company held at the offices of the Company on January 24th. Only routine business was transacted at the meeting, following which a light lunch was served to those in attendance.

Officers Re-elected

The officers of the Company are:

George W. Mead, President
R. L. Kraus, Vice-President
George B. Berkey, Vice-President
Isaac P. Witter, Treasurer
E. P. Redford, Secretary.

These officers with Theo. W. Brezeau, constitute the Board of Directors.

The annual meeting of the Thunder Bay Paper Co., Ltd., of Port Arthur, Ontario, Canada, the Canadian timber holding and pulp manufacturing subsidiary of the Consolidated, was also held the same day. The officers and directors of this Consolidated Company are virtually the same as those of the Consolidated.

SENATOR McNARY MAKES HIS STAND PLAIN

Makes Known Just How He Stands on the Important Question

SENATOR McNARY, of Oregon, after a research extending over nine months, advocates; Extensive additions to national forests and other public forests; a large increase in federal financial and administrative cooperation with the states in protection of all forests from fire; and revision of state taxation relating to forests.

Senator McNary would recommend the extension of public forests in the water sheds of navigable streams, both for protecting the stream flow and for timber production; and the removal, as far as practical, of risks and handicaps from private timber growers.

He states that the federal government owns 54 per cent of the Pacific coast forest area. That the protection against fire is fairly well developed. The re-forestation, outside the redwood area of California is not receiving the attention from the federal government and private timber owners which its relative importance demands from them.

Senator McNary would increase the current federal aid appropriations from $400-000 to $2,700,000 a year for these objectives. An immediate annual expenditure of $3,000,000 he claims in his report would greatly aid in conserving our forest area, the last big stand of which is on the Pacific coast.

Lumber production in this forest was above normal for the year 1923, and for the first two weeks in January, 1924, the dull season in lumber work, there was an increase of one per cent above normal. Lumber dealers are making plans for large business in their industry this year.

The west coast will be depleted of its forests in a few years unless an intensive re-forestation campaign is carried on. That the owners might the better protect their existing timber holdings and do re-forestation work on larger areas Senator McNary recommends the deduction from taxable income of all expenditures made by timber owners for fire protection and for re-forestation. These deductions are at present limited to forest fire patrol services.

* * *

Pushing Mill Building

The Austin Company is pushing the work on the paper-mill building of the Columbia River Paper Mills Company at Vancouver, Washington. W. F. Hammer, superintendent, states that it will be completed some time in February. The steel frame work is all in place, the hollow tiling on the walls is nearly completed and the sheeting on the roof has been finished.

Resting on a hollow base the side walls of the main room are constructed of glass for a height of seventeen feet. Paper manufacturers now recognize the value of ample light in their mills and are demanding architectural plans which will give them plenty of natural light. In this respect the Vancouver paper mill conforms to the latest models of paper mill architecture.

The two digesters will be finished about the same time as the paper mill is completed.

* * *

To Have Experiment Forest

The University of Idaho forest school has secured a square mile of state forest land for use as an experiment school forest. The land has been cut over, but is to be replanted for laboratory study of forest growth problems.

AMERICAN PAPER STOCK ASSOCIATION FORMED IN CHICAGO

Joseph Monheit is Chosen the First President of the New Organization

THE American Paper Stock Association was organized at a meeting of representative dealers held in this city January 31st at the Lexington Hotel. The following officers were elected:

President—Joseph Monheit
Vice-president—John V. Spachner
Secretary-Treasurer—Francis Hughes

The following members were elected to serve on the board of governors, for the full term, or until their successors shall have been duly elected and qualified: Messrs. Winnemann, Silberman, Charak, Sherman, Wilcox, Rizzo and Pushker.

The purpose for which the Association is formed is to promote social and friendly relations among its members, to promote uniformity of trade customs and usages; to uphold the principles of justice and equity in trade; to protect its members against illegal practices; to establish and maintain definite standards in the grading and packing of paper stock; to be devoted to the interests of the paper stock industry and to discuss and act upon any matter that may be of general interest to its members.

The headquarters of the Association, it was decided, shall be in Chicago. The membership of the organization shall be confined to corporations, firms and individuals who are wholesale dealers in, or packers of paper stock.

On motion of the chair, the Secretary was instructed to communicate with the Secretary of the National Association of Waste Material Dealers for advice regarding the progress made in the matter of obtaining a lower minimum weight of shipments of paper stock.

To Issue Statements

Following considerable discussion as to the manner of publishing information regarding current market values of paper stock, it was moved and carried that the chair appoint a committee of three, which shall have sole authority to issue official statements for the Association regarding the market value of paper stock. The chair appointed Messrs. Hughes, Spachner and Sohm to serve on the committee.

The next meeting of the Association will be held Feb. 22nd, in the Green Room of the Lexington Hotel, Michigan Avenue at 22nd St., at 2.00 P. M. Luncheon will be served to members, reports of committees received and other business transacted.

The following membership committee was appointed: Messrs. Mendelson, Hughes, Sohm, Spachner and Follansbee.

Committee on Specifications: Charak, Spachner, Pushker, Wilcox and Sherman.

A constitution and by-laws was adopted by the Association.

The revenue of the Association will be provided by initiation fees, annual dues and assessments, where same are necessary for work in hand.

The initiation fee is $50.00 and annual dues are $100.00, payable in quarterly installments, on the first days of January, April, July and October.

The regular meetings of the Association will be held on the last business day of each month. An annual meeting will be held on the last business day of January of each year, at such time and place as may be designated by call.

Members Enthusiastic

Members of the paper stock trade throughout the country, judging from local comment and letters received by Secretary Francis E. Hughes, are exceedingly enthusiastic over the formation and plans of the American Paper Stock Association. Indications for a heavy national membership by the end of the present year are numerous.

The following written applications have been received and accepted:

Levine Waste Paper Co.
Sherman Paper Stock Co.
A. Simon & Co., Inc.
Milwaukee Waste Paper Co.
The Kansas City Waste Paper Co.
Industrial Paper Stock Co.
U. S. Paper Supply Co.
Francis Hughes Co.

The following concerns renewed their verbal pledge to join the Association, made previously, and agreed to take at once the necessary steps to qualify for membership:

Missouri Paper Stock Co.
Alexander Wayne Co.
Federal Paper Stock Co.
S. Silberman & Co.
Continental Paper Grading Co.
Chicago Mill Paper Stock Co.
Northern Paper Stock Co.
Rocco Rizzo Sons & Co.
Ajax Waste Paper Co.
Sangamon Paper Grading Co.
Consumers Paper Stock Co.
Gumbinsky Bros. & Co.
Aetna Waste Paper Co.
Higgins & Henry
Cook County Paper Stock Co.
Mendelson Bros. Paper Stock Co.
Western Paper Stock Co.
Pioneer Paper Stock Co.
B. Park Paper Stock Co.

Plan Special Luncheon

The New York Division of the Salesmen's Association of the Paper Industry has decided to hold a special executive luncheon, Wednesday, February 20, which will take the place of the usual Monday luncheon meeting for that week. Members from all parts of the country are invited.

Vice President Ewing for the New York Division named the following committee to begin plans at once for the annual convention on April 8, 1924:

F. N. Countiss, Chairman; R. K. Baker; E. C. Chadwick; W. F. Heath; G. A. Keeney, Jr.; E. G. Lloyd; J. W. Quimby; Chester M. Robbins; G. M. Wetmore; R. D. W. Ewing, ex-officio; J. L. Fearing, ex-officio. In addition, the following were named on the committee from other divisions: G. K. Gibson, Chicago; Robert T. Houk, Jr., Ohio; F. W. Main, New England; D. H. Ross, Kalamazoo. The committee will meet within a week to begin its work.

Hornibrook Dies

The death took place in Toronto a few days ago of Ralph B. Hornibrook, aged 41 years, son of J. T. Hornibrook, director and secretary-treasurer of Brown Brothers, paper dealers and manufacturing stationers, Toronto. Deceased was born in Toronto and for years had been accountant for a big shoe firm in Toronto.

The Editorial Page

WOODROW WILSON

IT would be levity for even a trade paper to ignore the death of Woodrow Wilson this week. While Woodrow Wilson was not conspicuously indentified with the paper industry, he was always eminently fair to it when it came up in the routine of governmental events. It is not as trade representatives that the men in the paper industry think of Woodrow Wilson. It is as men.

Since time began no man has had a bigger place in the world than Woodrow Wilson. As president of the United States during the war years he wielded a power such as no tyrant ever had—and he wielded it wisely and well.

Woodrow Wilson was a noteworthy governor and a noteworthy president before the war. It was the war that transfigured him, that brought him the transcendent glory such as no man ever had before. Its first two years, dreadful though the spectacle was, failed to disturb his official calm. A man of peace, a student of American history, his thought seemed only of preserving for his country a correct attitude of neutrality. Intellectually, not morally, he weighed the issues as they affected America; and so weighing them adopted the course that for long kept us out of war, more follower than leader of public sentiment not always easily read aright. Of the real man he was, Mr. Wilson had revealed but little.

The call for action rent the veil. He who had declared no consciousness of greater evil on one side than the other now summoned the hosts of righteousness utterly to destroy the abominable thing that had wrought grievous wrong upon earth. From that moment till victory was attained he labored to make effective the furious energy, long pent up that, brushing aside every obstacle, sent our unmilitary armies swarming across the ocean in overwhelming numbers.

In their first endeavors to figure to themselves the significance of the death of ex-President Wilson, the people will fix their minds upon that in him which commanded the admiration of his fellow-countrymen and, at last, that of the whole world. They will dwell upon his high intellectual gifts; they will recall his strength of character and firm-set will; they will delight to think that his rise from obscurity to the position of the greatest political power on earth was typical of what America is and can do for her valiant sons. And a note of universal human spmpathy is sounded in expression of sorrow at Mr. Wilson's passing from the earthly scene.

As a great newspaper has said, Woodrow Wilson is not dead. The mind was the man, and it lives. The word was the man, and it did not perish with the racked body, any more than the Gettysburg Address was snuffed out by Booth's bullet. The man, who in Washington led with masterly ability the intellectual forces in the great war will not be forgotten; nor will the power of his work and words diminish with passing years.

The leader is lost. The cause lives. It is an American cause, in harmony with the role this Nation has played for years in substituting peaceful arbitrament for the test of slaughter. He shattered the Divine right of Kings and tumbled their thrones in ruins, and the Nation that anciently had forsworn Kings and Empires was led by evil counselors to desert in the face of the enemy.

A great man has passed. A man endowed to play upon a great stage a great part. Manfully he fought. Generously he will be judged by all Americans who in his unblemished integrity, dauntless courage and exalted purpose recognize priceless virtues.

His clear, concise words, his energetic, steadfast acts, his high intention will live imperishably in the hearts of his countrymen.

Through the Middle West

Wonder About Dam

Experts have been engaged by the city of Eau Claire to determine what effect the new dam with a 32 foot head which the Dells Paper and Pulp Co., Appleton, Wis., proposes to build will have on the city's water plant. The original dam, which was built by the city in 1877, was leased to the Dells Company for 99 years and the company now proposes to replace the present dam with a 26-foot head with a new structure having a 32-foot head. The dam will cost about $1,000,000.

Recently the paper company suggested to the city that it proposed to build the dam to provide a 26-foot head but that it would be well to construct the piers and groundwork so the head could be increased to 32 feet if the demand for power ever warranted the additional construction. The city approved this under certain conditions which the company accepted. The paper company now proposes to erect the dam with a 32-foot head at once. It is believed the additional 6-foot head will result in flooding the city water plant and will cause other damage. Experts have been engaged to determine the damage that will be caused. The paper company will be asked to pay for moving the waterworks plant, if that is necessary.

* * *

40 Ton Mill to Start

Manufacture of paper in the 40 ton mill which is being built by the Tomahawk Kraft Paper Co., near Appleton, Wis., will be started about May 1, according to word from the company. Machinery is being installed and will be ready for use by the latter part of April. Rapid progress is being made in construction. Practically all of the exterior work has been finished.

Additional equipment will be installed as it is required. The company will require about 25,000 cords of pulpwood a year with the first installation.

This mill will manufacture kraft paper and a new sulphate mill is now being built for the manufacture of this kind of pulp. The capacity of this sulphate plant will be forty tons per day.

A new dam and power house has been built to furnish power for the pulp and paper mill. The power house is so equipped that its operation will be automatic.

All modern machinery and the latest labor saving devices are being installed. These new mills will give employment to about 200 men.

* * *

Mead Again President

George W. Mead was re-elected president of the Consolidated Water Power and Paper Co., at the annual meeting of directors last week. Other officers re-elected are: R. L. Kraus and George P. Berkey, vice presidents; E. P. Redford, secretary; I. P. Witter, treasurer. The officers and T. W. Brezeau are the directors.

Officers of the Thunder Paper Co., Ltd., the Canadian timber holding subsidiar of the Consolidated Company, were re-elected at a meeting held the same day. Reports of officers of both companies were presented at meetings of stockholders.

George McMillan, one of the oldest stockholders in the Consolidated Company, now living in Florida, sent a box of oranges which was distributed after the business meeting of stockholders.

GEORGE E. BARDEEN PASSES AWAY

One of Best Known Papermakers in United States Dies

GEORGE EDWARD BARDEEN, of Kalamazoo, Mich., one of the best known paper manufacturers of the United States, died Saturday, January 26, at his winter home in St. Petersburg, Fla., following an extended illness over a period of years. Mr. Bardeen had a premonition of death several weeks ago and planned to return to Otsego to die and was only deterred from doing so because of reports of the northern cold waves in the last month.

Mr. Bardeen was born at Fitchburg, Mass., November 10, 1850. While he was still a little boy, his mother married the late Samuel A. Gibson, recognized as the founder of the paper industry in the Kalamazoo valley. Mr. Gibson, on coming to Kalamazoo, accepted the presidency and general management of the Kalamazoo Paper Company, in which position he gave a valuable training to his stepson.

In 1887 Mr. Bardeen resigned the secretaryship of the Kalamazoo Paper Company to organize the Bardeen Paper Company of Otsego, recently absorbed by the Allied Paper Mills, Inc. He was instrumental in organizing a number of other paper companies in the Kalamazoo valley and was an official or director in many of them. At the time of his death he was president also of the Kalamazoo Stove Company and the Globe Casket Company. He was an official or director of more commercial concerns in Kalamazoo than any other man.

He was one of the active promoters of the Belvidere Resort Association, a summer resort organization at Charlevoix. Despite his successes in the business world, he was intensely democratic and was personally popular with his employes. One of his most enthusiastic undertakings was to give Otsego a winning ball team and to march at the head of the nine on numerous occasions.

* * *

Given a Surprise

President Fred M. Hodge of the Kalamazoo Paper Company and his wife were the guests of honor at a surprise dinner given by the executives of the mill in honor of the silver anniversary of Mr. Hodge's election to the presidency of the company.

The event was followed by the annual winter picnic, which was attended by 1,000 employes and their families. One of the features of the entertainment was the announcement of the winners of the 1923 "Better Gardens Contest" held by the company. The first prize was won by Fred Hein; the second by George Weick; and the third by Charles Redmond.

* * *

Estate of C. M. Dennison, Jr.

The will of Charles M. Dennison, Jr., vice president of the Rocky Mountain Bank Note Company has been filed for probate. A preliminary statement places the value at $100,000.

Among the bequests to his son Stuart Dennison is the family bible, bound by the testator's grandfather, and a newspaper published in Connecticut 144 years ago.

* * *

IF YOU CAN'T say "No" occasionally, you must take the consequences.

Low Water Causes Shortage

The very low water in the rivers of Wisconsin, in fact, all over the Northern States during the fall of 1923 and up to date in 1924 has curtailed the amount of water power available for the manufacture of groundwood and most of the mills have been down to bed rock for a considerable period. Many mills are now buying this grade of pulp from foreign manufacturers from foreign countries, but the cost thereof is almost as much if not more than sulphite pulp of domestic manufacture.

Most of the Wisconsin mills are operated with direct connected water wheels, and only the surplus or high water flow is used for the manufacture of groundwood. Few of them are driven electrically and therefore they are not in a position to buy powers from others, or to make power by steam turbine to produce the pulp they require. Some of the Wisconsin mills are now installing electrical machinery as auxiliary to their water wheel equipment and if another low water season like the one just past follows more of them will have to do so, or else go out of the business of making groundwood papers.

There is a considerable demand at present for many grades of paper which use a large percentage of groundwood and this tends to reduce the stocks and cause the shortage referred to.

* * *

Gift of Oranges

After all business had been transacted, special dividends in the form of a case of oranges, a gift from George McMillan, who is now in Florida, were distributed among the stockholders. Each stockholder received an orange, and in addition orange juice made from Mr. McMillan's gift was served. Mr. McMillan has been a stockholder of the Consolidated Company almost since its establishment, and is the oldest stockholder in point of years. Until lately, when he has been spending his winters in Florida, Mr. McMillan was a regular attendant at the annual meetings of the company.

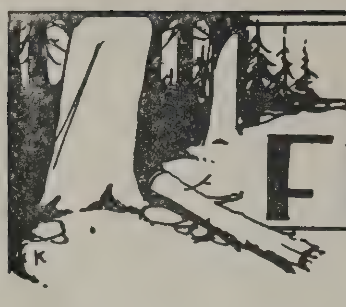
35 Days, No Accident

The Kimberly-Clark Company paper mill at Kimberly has operated thirty-five days without an accident it was announced in connection with the safety contest which will close on March 1. This is considered by officials one of the most remarkable records in the history of this mill.

The employes are divided in two groups, the green and yellow, and the competition is keen. The greens held a safety mass-meeting at the clubhouse recently for employes and their families and more than 1,000 persons attended.

Speakers at the mass meeting were the Rev. F. X. Van Nistleroy, the Rev. Willard H. Reeves and F. F. Shattuck. Several vaudeville stunts were included in the program.



NEWS FROM CANADA

No Dumping Here

Reports from Washington conveying the insinuation that Canadian manufacturers of newsprint are trying to slip something over the United States customs officials by shipping to the Republic high-grade papers labelled as newsprint are not taken seriously by the Canadian trade. One shipment of newsprint was recently held up and a small sample of it submitted to a chemical analysis, which seemed to show 40 per cent of sulphite pulp. Later, however, different arrangements were made for keeping check of shipments of Canadian paper. Shipments are being no longer held up, and it positively declared that no shipments of book paper have gone into the United States as newsprint. There is no truth in the report that Canadian paper, presumably book, has been sold in the Canadian price at prices 50 per cent below the home price. This would suggest "dumping," for which there is not the slightest suspicion. Canadian trade returns show that practically no Canadian book paper has been sold in the United States during the past year.

* * *

Revenue Drops

The revenue of the Lands and Forests branch of the Ontario Government will be about $1,000,000 less during the past year than for the this one, when receipts reached the high-water mark of $4,000,000. The drop off in the year's timber revenue is said to be due to the slackness in cutting last winter, particularly pulpwood, in the camps of the province and also that the present administration closed its books for the fiscal year in October last year instead of extending the time for several months. Last year the forest revenue was jacked up by the U. F. O. Government by reason of extra revenues from lumber companies paying dues for "overruns" and also by crediting considerable amounts of arrears which had piled up between 1919 and 1922. When everything is taken into account the revenue of the Forestry Department is considered satisfactory.

* * *

May Cause Over-Production

The fear is expressed in some quarters that the rapid increase in the number and capacity of Canadian newsprint mills may cause temporary over-production. In 1923 the production was 1,261,951 tons, as compared with 1,080,333 in 1922 and 805,134 in 1921. The average daily production went up from 3,821 tons in January to 4,263 in December, though it dropped back to 3,829 in December. This seems to have been brought about by the very high production during the fall months, for in December shipments were 5,000 tons more than production. Hon. James Lyons, Minister of Lands and Forests for Ontario, says that that government has before it applications from at least 12 companies that desire to build pulp or paper plants, but that before granting them an investigation will be conducted to see whether they are warranted.

CANADIANS WILL STILL CONTROL COMPANY

Bay Sulphite Reorganization up for Vote Shortly

A PLAN for the reorganization of the Bay Sulphite Company has been formulated by the bondholders' protective committee and will be presented to the bondholders' protective committee on February 21st. A feature of the plan that is expected to win favor is the fact that reorganization provides for retention of the control in Canada, and in hands that ensure due protection of the bondholders interests. Much money was lost by this company as a result of the Becker failure, but the loss is not irreparable, nor is the loss of the British selling concern. Pulp is now being sold in the United States and though one of the company's mills, the Chandler in Saspe county is not operating, production is at a fair level, and the margin of profit such that about $500,000 is being earned to cover bond interest of about half that amount. A number of those who bought Bay Sulphite bonds last spring are surprised to find now that they do not own the Chandler mill, but rather that it is owned by another corporation, The St. Lawrence Pulp and Lumber Co. Bay Sulphite owns the entire capital stock of the St. Lawrence Company, but there are nevertheless bonds outstanding on the St. Lawrence property, so that the Bay Sulphite bonds are a first charge on the Port Alfred mill, but not on the Chandler mill. The reorganization of the company is likely to take the form of a new company to buy Bay Sulphite's assets, and to assume its liabilities, and which will give new bonds for the old ones now held. This means that the position of the bondholders will be unchanged, and as the common stock is not widely held, there would not be widespread loss to investors.

* * *

Continental Bonds

A portion of the $6,000,000 issue of 6½ per cent first and refunding bonds of the Continental Paper and Bag Mills Corporation is being offered in Canada, at 95½ Canadian funds to yield 7.70 per cent. Among other things, the Corporation will acquire the plant of the Continental Paper & Bag Mills at Ottawa, which, in addition to being a large producer of bags and paper specialities, is the owner of 65,000 acres of freehold timber limits and has rights on 1217 miles of timber limits in Ontario.

* * *

Buy 400 Acres

A definite step towards the establishment of a reforestation area in the northern part of York County was taken last week when the County Council voted to purchase 400 acres in Whitchurch township for this purpose at a cost of $6,250. Reforestation will be proceeded with by the Lands and Forests Department of the Ontario Government as soon as the land is purchased.

Has Huge Limits

In a recent historical survey of the Abitibi Power and Paper Company some interesting facts are given with regard to the development of the company's industries which are located at Iroquois Falls, Ont., 550 miles north of Toronto. The company controls limits of over 1,500 miles, or about 1,000,000 acres of well wooded forest area. The falls at Iroquois and Twin Falls supply 53,000 developed horse-power, operating a mill having an annual capacity of 186,000 tons of pulp and paper, of which the newsprint production is 500 tons daily. The management of the Abitibi company are operating with a knowledge of the difficulties that have beset the industry in the past. Therefore, the protection of forest reserves, selective cutting and reforestation go hand in hand with production. The physical development of the property includes the construction and extension of logging lines for the winter supply of raw material to the mills, resulting in a large saving in coal, as well as in interest and insurance.

* * *

Changes Completed

The additions and changes to the plant of the Nashwaak Pulp & Paper Company, St. John, N. B., have been practically completed and within the next few weeks the company expects to have the second pulp drying machine in operation which will increase their output of bleached sulphite pulp to 80 tons a day. At present the capacity is about sixty tons. Howard E. Breedy, vice-president of the company, reports that the plant is operating to capacity and they are having no difficulty in disposing of their product. The logging operations of the firm are progressing favorably. While weather conditions in December and early January handicapped activities to some extent, since the first of the year everything has been going satisfactorily.

Nothing Exceptional

While there has been fairly good placing business done on newsprint to cover future requirements, Canadian mills report that the amount of buying in book, bond, cover and other lines has shown nothing exceptional since the beginning of the year, although most of the mills are fairly busy. Year-end inventories by dealers have indicated that, while a trifle heavier in most cases than last year, the suspension of buying in December caused by the impending sales tax, found the advent of the new year with lighter stocks than would otherwise have been the case. The taking of the inventory in large jobbing houses was, moreover, quite a task, for stocks subject to tax rebates had to be carefully estimated. Only when immediate turn-over made it advisable, was any buying done during the last month of the old year and January's business therefore reflects some reaction by way of building up desirable stocks. Still, it is pointed out, buying at wholesale as well as retail has not been on a broad scale. In fact in some quarters it is reported to have developed into a hand-to-mouth character. Some new import lines are steadily making their appearance. This applies to cover, book and bond papers, while espartos are well in evidence. It is even stated that German bond papers have been figuring in the market and the observation would seem warranted that foreign specialty papermakers are inclined to consider the Canadian paper market entitled to a try-out in the matter of quality as well as price. Such reductions in price that have taken place may hardly be considered a definite factor and the tendency is towards general firmness.

* * *

"Snowmobile" Busy

Charles W. Cox's "Snowmobile" to be used for crossing Lake Nipigon during the winter for supplies to his pulpwood camps in the Port Arthur district, has arrived at Port Arthur from New Hampshire, and was tested out last week. The car made twenty miles an hour around town and on country roads went up to thirty miles an hour and cut through deep snow banks with ease. It is a Ford truck with the front wheels removed and set back near the rear transmission wheels.

* * *

Off to Europe

Fred. L. Ratcliff, head of the Ratcliff Paper Company, Limited, Toronto, has left, with Mrs. Ratcliff on a business trip to Europe. Mr. Ratcliff will visit a number of the paper mills on the continent and return to England in time for the opening of the British Empire Exhibition where a number of the Canadian paper firms will have exhibits.

Grand Old Man Active

John R. Booth, Canada's Grand Old Man of the lumber industry, who at 98 years is still the active head of the great Booth Corporation at Ottawa, has had a touch of bronchitis. Of late he has not been driving down with his horse and sleigh to business quite so regularly. Mr. Booth, who recovered from a broken leg received while helping to pile planks at the age of 88, scorns the ways of other and lesser millionaires who journey southward in winter. The frosty air and bright sunshine of the Ottawa Valley are good enough for him. He is happier at home superintending the work and visiting at the homes of his habitant employees to whom this rugged veteran of the lumber woods has been a kind friend.

Mr. Booth will go down to posterity in the films, for he appeared by special request a few days ago in that epic of the Ottawa River driver, "The Man From Glengarry." The next drama in which it is hoped he will take part will be the wedding of his granddaughter, Miss Lois Booth, with Prince Erik of Denmark. The nupitals are to take place in a leading Anglican church at Ottawa and admission will be by ticket so that the general public will not crowd out the guests.

* * *

Has Big Destiny

Canada is destined to be the most important papermaking country in the world, said Olivier Rolland, manager of the Mont Rolland Paper Company, Limited, in the course of an address before members of the Montreal Paper Club. At the present time the United States is in the lead in papermaking but Canada will outstrip the Republic to the south in this respect, is Mr. Rolland's opinion. In view of Canada's important position in the paper industry, it would be a fitting move on her part to erect some testimonial to the memory of Louis Robert who did so much for the industry by inventing the paper machine in 1799, in a city in France, suggested the speaker. He urged a monument or some similar testimonial to Robert.

* * *

Making Wedding Bristols

The Howard Smith Paper Company, Limited, have sent out from their Toronto office samples of a new line of Wedding Bristol which the jobbers are extensively stocking and which is taking the place of the imported product. The products are made in a complete range of sizes and substances and are done in plate and kid finish. Fine rag stock of high color is used in the manufacture of the bristols.

Air Patrols Formed

Forest fire protection changes in New Ontario, hinted at by Premier Ferguson in Toronto last week in addressing a Northern Ontario delegation, are understood to be of far-reaching importance and to involve the entry of the Ontario Government into air patrol services under its own auspices upon an extensive scale. Within the past week tenders for various types of air patrol service received from two commercial flying companies were opened but held in abeyance. Prior to their receipt, and subsequently, the Minister of Lands and Forests has been collecting data as to the cost of establishing an air patrol of its own for the northern forest belts. Such a scheme, if ultimately decided upon, would involve the purchase of from ten to twelve hydroplanes and the management of crews. Already in the employ of the Forests Department are six or seven expert flyers who are also qualified foresters. A great deal of data as to the cost of flying in Northern forest belt conditions has been collected by the Government. Also, information has been obtained as to the cost of establishing and maintaining bases for such operations, and it is said that their figures show that the cost of flying under their proposed scheme can be cut down by over fifty per cent of the amount that has been charged. The cost of airship purchases has also been looked into and quotations received on a dozen or so planes.

* * *

Might Cause Monopoly

That the proposed embargo on pulpwood exports from Canada would tend to encourage a monopoly by the Canadian pulp companies which would hit the small pulpwood producers, was the effect of testimony given before the Royal Commission on pulpwood at North Bay by William Miln, Sr., and Patrick McCool, old North Bay men actively engaged in the pulpwood and lumber business. Both were against the embargo on principle, but admitted that they would be in favor of it, providing there were a minimum pulpwood price in the home market set by law. That there would be no valuable timber left between the Transcontinental and the Sault branch inside twenty years, was the statement made by Mr. Miln, who strongly advocated a more stringent conservation system. The present consumption of timber resources, combined with waste and loss, is too heavy to leave a great deal of hope for the life of Northern Ontario's forest resources, he felt.

CONSTRUCTION NEWS

A Summary of Vital Facts Regarding Construction, Finances and Operation of Paper Mills

Los Angeles, Cal.—Blake, Moffitt & Towne, 242 Los Angeles Street, wholesale paper, have awarded a general contract to the Clinton Construction Co., Los Angeles, for the erection of its proposed plant addition, to be four-story and basement, 187x216 ft., estimated to cost approximately $400,000, instead of a smaller amount, previously given out. It will be equipped with elevators and labor-saving machinery. J. D. Galloway, First National Bank Building, San Francisco, Cal., is engineer.

Bogalusa, La.—The Union Bag & Paper Corporation, Woolworth Building, New York, N. Y., is reported to have awarded a general contract to Hampton Reynolds, New Orleans, La., to construct a new local plant for the manufacture of paper bags and containers, estimated to cost in excess of $200,000, with machinery. The company is also said to be perfecting plans for the construction of similar plants at different points in the south.

Milwaukee, Wis.—The Economy Paper Co., 64 Cawker Building, A. L. Ebert, head, is said to be planning for the purchase of a paper-cutting machine and other equipment.

Cap de la Madeleine, Que.—The St. Maurice Paper Co., has plans under way for the construction of a new one-story addition to its local mill, to be equipped as a machine room, estimated to cost about $55,000. Work will be commenced at an early date. G. A. Slater is engineer.

Latrobe, Pa.—The Barrett Mfg. Co., has work in progress on improvements at its local paper mill, to include the installation of considerable additional equipment. The boiler house is also being modernized, and new boiler units, with auxiliary equipment, have been installed.

Buffalo, N. Y.—The papyrus Products Co., 52-54 Pearl Street, manufacturer of collapsible boxes and other paper containers, has tentative plans under advisement for the establishment of a new plant, to replace its works destroyed by fire, Jan. 22, with loss estimated at $85,000, including equipment. The company occupied leased quarters at the location noted.

Green Bay, Wis.—The Northern Paper Mills, Inc., foot of Day Street, is perfecting plans for the installation of a new filtering plant at its local mills, estimated to cost $75,000, with equipment.

Chippeway Falls, Wis.—Fire, Jan. 17, destroyed a portion of the falsework of the dam of the Dells Pulp & Paper Co. The amount of estimated loss has not been announced. It is planned to rebuild at once.

New York, N. Y.—The Forbes Paper Co., has leased the six-story building at 32 Laight Street, for a new local works and headquarters.

West Chester, Pa.—Fire, Jan. 18, damaged a portion of the local plant of the Denney Tag Co., to be replaced at once. The estimated amount of loss has not been announced.

Philadelphia, Pa.—The Victory Wall Paper Co., Inc., has leased property at 133 North Eleventh Street, for a local distributing plant and headquarters.

Chicago, Ill.—Fire, Jan. 22, damaged a portion of the warehouse of the Western Paper Stock Co., Indiana Avenue. The estimated loss has not been announced. It is proposed to rebuild at once. The manufacturing works of the company, adjoining, were unharmed.

New Companies

Chicago, Ill.—The Diamond T Paper Co., 2138 West Van Buren Street, has been incorporated with a capital of $20,000, to manufacture and deal in paper products. The incorporators are G. M. Peters, Arthur Dixon and William Burry, Jr.

Wilmington, Del.—The Southern Pulp & Naval Stores Co., has been chartered under state laws with a capital of $5-000,000, to manufacture wood pulp, paper products, etc. The company is represented by the Corporation Trust Co., of America, du Pont Building, Wilmington.

Jersey City, N. J.—The American National Products Co., 30 Bergen Street, has filed notice of organization to manufacture labels and kindred paper specialties. Joseph H. Jaeckel heads the company.

Chicago, Ill—The Republic Waste Paper Co., 1039 West Congress Street, has been incorporated with a capital of $20,000, to deal in paper products. The company is headed by E. S. Hartman, David Dolnick and M. Jackson.

Malden, Mass.—The Malden Paper Stock Co., Inc., has been incorporated with a nominal capital of $5,000, to manufacture and deal in paper products. Charles Fine is president; and L. Werlinsky, 43 Upham Street, Malden, treasurer.

San Antonio, Tex.—The Crown Paper Box & Label Co., has been incorporated with a capital of $9,000, to manufacture paper boxes and containers. The incorporators are Leo Singer and M. J. Arnold, both of San Antonio.

Financial

Montreal, Que.—The Laurentide Paper & Pulp Co., Ltd., is being organized to take over and consolidate the company of the same name, the St. Maurice Paper Co., Belgo-Canadian Paper Co., and the St Lawrence Pulp & Paper Co., all operating in the St. Maurice Valley section, near Cap de la Madeleine, Que. The new organization will be capitalized at about $70,000,000, and plans for extensions and improvements in the different mills and properties, including the installation of additional equipment.

New York, N. Y.—Charles A. Marshall has been appointed receiver for the Durham Pulp & Paper Co., 17 East Forty-second Street, operating mills at Durham, Pa.; Hadley, Forresport and Napanock, N. Y.; Seymour, Conn.; and Rising Sun, Md. A bond of $10,000 was furnished by the receiver. The liabilities are said to be in excess of $1,000,000.

Philadelphia, Pa.—Nathan D. Isen, receiver for the Bridge Paper Co., 1226 North Tenth Street, has arranged for the sale of the property of the company.

Chicago, Ill.—S. L. Schwarz & Co., Inc., has filed notice of change of name to the Schwarz Paper Co., and plans to expand its business.

Washington, D. C.—The Stamford Paper Co., a Delaware corporation, has filed notice of increase in capital from $150-000 to $250,000, for general expansion. The company is represented by the United States Corporation Co., Dover, Del.

Plant Operations

Fitchburg, Mass.—Paper mills in this section are advancing operations and adding to their working forces, with indications that the present basis of production will be continued for some months to come. The Falulah Paper Co., has recently resumed full operations, giving employment to a regular working force, full time. The company is said be be booking good business, and expects to run continuously for months ahead. The Fitchburg Paper Co., heretofore operating on a curtailed schedule, has increased production to a full time basis, giving employment to an increased working force. About 70 per cent of the full working quota has been employed until the recent change in advancing schedule. The Crocker, Burbank Co., is employing a full working force on a full time basis, although orders have been slow, it is said, for several months past. It is proposed to advance production as soon as conditions warrant. Louis Dejonge & Co., are maintaining manufacture on a full time schedule, with curtailed working quota. It is expected to add additional workers until a full force is available, within the next month or so. It is stated that there is a noticeable increase in orders in recent weeks.

Business Opportunities

The Bureau of Foreign and Domestic Commerce, Washington, D. C., has information regarding a company at Vienna, Austria, in the market for American paper and paper-box manufacturing equipment; also, for machines for the manufacture of playing cards and kindred products, Reference No. 8914.

The Acme Candy Co., 221 South Goldsboro Street, Wilson, N. C., now establishing a local plant, is planning for the purchase of a quantity of folding paper boxes and containers.

A Wisconsin Logging Problem

Locations Alter Conditions

By B. T. McBAIN

Assistant General Manager, Nekoosa-Edwards Paper Co.

MOST of the mills in the Eastern States buy their wood either peeled or rossed and only have to wash it as it enters the mill before cutting to proper size for grinders or choppers. In contrast, most of the so-called Middle West Mills, or Lake State Mills, buy their wood with the bark on.

In the one case, the mills pay for the removal of the bark and save the freight, not alone on the bark but on a great deal of moisture which very quickly leaves the wood after removal of bark. In the other case, the mills pay freight on the bark and moisture, pay less to the producer for the real wood they finally use; but pay for the barking and cleaning of the wood after arrival at the mills. Each faction claims his way the better; but cost figures have proven the Eastern method the best though it is difficult to put it over in Wisconsin.

The railroads do not understand the situation. In the one case the mills order box cars. "We do not want our wood to get dirtier than it is and want to unload it from the box car direct into conveyor to stacker or to mill." In the other case, the Wisconsin mill men say, "we want our wood loaded on flat or gondola cars, because we want to store the wood and want to handle it by steam grapples to save handling costs." In some of the districts, part of the wood goes East and part West.

But the Western mills will learn, and sooner or later they will demand that wood contractors supply wood with the bark removed, so it has a chance to dry out; so the worms can do no harm; so they can save one-third of the freight now paid and so they have only to handle 100% wood and will not have to be bothered with the removing of the bark at the mill and disposal of the bark thereafter.

In one mill they say they get good fuel value from the bark; but on figuring the cost of the bark in freight alone and the value of the bark in pounds of coal or B. T. U. value, it is very expensive fuel comparatively speaking.

The paper mills of Wisconsin produce 3,100 tons of paper per day. About 2,400 tons per day is made direct from wood. About 1,000,000 cords of wood are used annually.

If the average freight cost is $6.00 per cord or $6,000,000 per annum and one-third of this cost is on the bark and excessive moisture of the wood kept in by the bark, the Wisconsin mills are wasting annually $2,000,000 on freight alone.

This is a matter requiring attention. It is not a matter for Foresters or for Logging men to decide; but a business proposition for business men to investigate and for business men in the pulp and paper industry of Wisconsin to decide.

New Trains at Marinette, Wis.

Marinette, Wis.—To take care of the record log shipments from the north another freight train will be run from the logging camps in northern Marinette County to Marinette, officials of the Chicago, Milwaukee and St. Paul Railroad announced recently. It may even become necessary to add a second train at a later date.

The sawmills in and around Marinette will do a bigger business than in 1923, a record year, lumber heads predict. Last year 75,000,000 feet of lumber were sawed at the mills of the Sawyer Goodman Company and mill men declare that the 1924 total will run above 100,000,000 feet.

If fire is kept from devastating the forests there will be little danger of a timber shortage in Marinette county, lumbermen declare. It is estimated that the forests of northern Marinette county will keep the industries of that country going for many years to come.

NEW GERMAN BOOK ON EMBOSSING

Walter Hess Publishes New Treatise on Art of Embossing

A Review by Thomas J. Keenan

A BOOK that is unique among treatises dealing with the arts and industries is *Die Papier-Pragetechnik* by Walter Hess. The book is described as a "Praktisches Handbuch fur die gesamte Papier-Pragetechnik," which is to say, that it is a Practical Handbook for the Technology of Paper Stamping and Embossing. It is a book of 226 pages well illustrated with 55 figures and tables, being the second enlarged and improved edition of a work originally published by M. Krayn in 1911. The present edition was issued last year by the same publisher at $1.25 in paper covers.

A book of this kind would be highly suggestive and useful for all engaged in the industry of embossing and stamping paper and paper goods. The author distinguishes between the process of embossing or stamping and the process of pressing by means of a simple illustration given in the preface. The manufacture of coins, medals, etc., requires the "stamping" process while the production of book covers, pulp plates and so forth is effected by "pressing."

The dies and presses used for monograms, addresses and names in relief, together with hints on the use of colors and pigments are well discussed. The process of gilding with leaf metal, the stamping of designs on book covers in plain or fancy colors, the manufacture of seals all find a place in this textbook. The cold and hot processes are treated separately in detail and the information is of general application.

For those who can read German the book will be found especially valuable and PAPER will be glad to take orders for it.

* * *

An old farmer and his wife lived near the village church. One warm Sunday evening, while they sat dozing on the porch, the crickets set up a loud chirping.

"I just love that chirpin' noise," said the old man drowsily, and before the crickets had stopped he was fast asleep.

Soon afterward the church choir broke into a beautiful chant.

"Just listen to that," exclaimed his wife, "ain't it beautiful?"

"Yes," murmured the old farmer sleepily, "they do it with their hind legs."—*Drew's Imprint.*

UNIFORM FORESTRY LAWS

By **B. T. McBAIN,**

Secretary, Wisconsin Forest Protective Association

REDUCTION in taxes, uniform forestry laws in Minnesota, Wisconsin and Michigan and the early completion of the St. Lawrence waterway as the major project toward the solution of the transportation problem of the nation," were recommended at the conclusion of the Tri-State Development Congress held in Duluth, Minn., January 25th.

That all the problems considered at the Congress referred to are of great importance cannot be denied. All have a bearing on each other and particularly the first two "Reduction in taxes" and "Uniform Forestry Laws" for the success of the latter depends greatly upon the former. But whether the others are successful or not, the need for Uniform Forestry Laws and then the strict enforcement of them, is apparent to all.

"The pen is mightier than the Sword," but of what use will the pen be without paper? America uses the greatest amount of paper per capita of any country. Of course, great amounts of this paper are wasted, for Americans are also the most wasteful people on the Globe.

Fully 95% of the paper used in America is made on the continent from trees grown either in Canada or in the States and for many years the three Lake States were the greatest lumber and pulpwood producing States in the Union. They are still producing but the day is fast approaching when there will be no forest products, not because nature did not try to do her part; but because we Americans, residents of the three producing States, did not do our part and aid Nature in her work by protection of the young forests seeded each year.

The Forest products industries do not use each year more than one-tenth of the amount which it is necessary to write off per annum from the available forest timber in the United States and Canada. The other 9/10 is loss by fire, insects and disease, the greatest percentage of which could be saved if we would but organize and co-operate

What would our cities be and how long would they be on the map if fire protection was not given the attention that it is? The same and even better results can be gotten by even less attention if each township of timber land is given anything like the fire prevention attention even the smallest villages receive.

America's timber, if we look at it right, is America's life and the sooner America and Americans realize this, the better for all of us.

May the Tri-State Development Congress be successful in all its undertakings but may the first two and particularly the second one be given such attention that the year 1924 will not close without such State and Federal action being taken that the forests of the States of Minnesota, Michigan and Wisconsin are forever protected from fire to the great gain of America and Americans.

S. L. Dawson and Hughes Engraving and Lithographing Company, Limited, Richmond Street west, Toronto, assigned last week to N. L. Martin and a meeting of creditors has been called for the middle of February. The firm is one of the oldest in Toronto. Many paper firms in Toronto are creditors for considerable amounts.

CANADA EXPORTED $140,798,453 WORTH OF PAPER

The Year 1923 Shows That Canada Exported Immense Tonnage As Compared With 1922

A REPORT from the Canadian Pulp and Paper Association shows that the value of the pulp and paper exports from Canada in 1923 amounted to $140,798,453. For the previous year the total value was $115,863,742; so that last year's figures showed an increase in the value of $24,934,711 or more than 20 per cent.

The following table gives a comparison between the quantities and values of various grades of pulp and paper exported last year and in 1922.

PAPER	1922		1923	
	Cwts.	Value	Cwts.	Value
Newsprint	19,190,291	$68,362,817	22,759,245	$85,611,258
Book Paper	31,695	225,710	49,318	365,956
Wrapping	372,170	2,780,386	425,527	3,170,429
Bond & Writing	12,228	132,980	23,222	240,535
All Other		3,324,000		4,382,779
		$74,825,893		$93,770,957

PULP	1922		1923	
	Cwts.	Value	Cwts.	Value
Mechanical	6,295,204	$ 9,410,083	6,822,140	$11,599,323
Sulphite Blchd	2,934,086	11,993,202	3,197,466	13,574,220
Sulphite Unbld.	4,168,924	10,477,746	4,560,665	12,406,095
Sulphate	2,966,720	9,166,818	2,926,906	9,453,758
Total Pulp	16,364,934	$41,037,849	17,507,177	$47,027,496

The value of the exports of finished paper showed a greater advance over the 1922 totals than did the value of the exports of pulp, although practically every grade of pulp and paper shows larger exports than 1922.

Our most important item for export in this industry in newsprint and of this grade of paper Canada exported 1,137,962 tons in 1923, this being the first time the total has crossed the "million tons" mark. The greater part of this went to the United States which accounted for 1,115,355 tons leaving a total of 22,607 tons for the shipments to overseas countries.

For our book and writing paper the principal markets were Australia and New Zealand, smaller quantities going to the United Kingdom, Japan and South Africa. Wrapping paper exports were chiefly to the United Kingdom, Australia, South Africa and Japan.

By far the greater part of the pulp exported from Canada was destined for the United States, which took 216,956 tons of mechanical pulp; 146,345 tons of sulphate; 147,594 tons of bleached and 167,182 tons of unbleached sulphite; a total of 678,077 tons out of an exportation of 875,370 tons.

Canadian exports of pulpwood for the year amounted to 1,384,230 cords valued at $13,525,004. This is the highest figure reached by the export of this raw material and is a big increase over the exports of 1,011,332 cords valued at $10,359,762 recorded in 1922.

* * *

Claim Land Is Damaged

On agreement of riparian owners and officials of the Wisconsin River Pulp and Paper Company of Portage County, Wisconsin, a hearing before the state railroad commission in which the River Pines, Inc., sought to establish a maximum level of water for the dam maintained by the paper company, has been postponed. Riparian owners claim their land is being damaged by a rise in water caused by the dam and company officials are attempting to reach an agreement which will make it unnecessary to take the matter before the state utilities commission.

* * *

Make Splendid Average

The average daily production of all paper machines in the plant of the Mead Pulp & Paper Company at Chillicothe, Ohio, averaged 35,000 pounds more per day during the year 1923, than was the daily average for the year 1922. Like increased average daily productions were made in practically all departments of the plant during the year 1923, reported General Manager H. P. Carruth at the President's Annual Dinner, held on January 13th, at which time President G. H. Mead acted as host to a large number of the Mead plant employees and their ladies.

* * *

One hundred and twenty-nine employees of the Mead Pulp & Paper Co., at Chillicothe, Ohio, own stock in the company. These 129 employees own a total of 1,660 shares of Special Preferred Stock, with a par value of $100 per share.

Paper and Board

New York, February 5—Business in paper appears to be moving along in a rather smooth manner with the market developing few changes or features which could be called important. Consumers are purchasing in a careful way and almost solely against their direct requirements, but there is nevertheless a sufficient movement of paper of most kinds to keep mills fairly well engaged and also to keep jobbers and distributors active in filling the wants of customers.

Prices of most descriptions of paper are being maintained but there is some sign of easiness in certain quarters. This is particularly true as regards coarse papers. Southern manufacturers of kraft wrapping paper are said to be selling at prices so far below those quoted in the North that mills in the latter part of the country are obliged to sell at reduced levels in order to compete. Moreover competition of foreign kraft paper is a disturbing market factor and one which is leading to price softness.

There is a firm tone to newsprint. Demand is holding up strong and prices are steady, with the tendency of quotations in the open market in an upward direction. This is one class of paper manufacturers who do not have to become concerned over current demand for their product, since most newsprint producers have their output sold ahead for several months on contract, with publishers ready to take more paper if the supply were available.

Book papers are in at least a little better demand than a short while ago and everything would seem to forecast a steady expansion of activity in such paper. Magazine and trade periodical publishers are gradually enlarging the size of their publications as increased amounts of advertising are received, and opinion in the trade is that book paper mills are due to enjoy a big year in 1924. Prices appear somewhat steadier than they were though there is still room for improvement in this connection. Some manufacturers are not hesitating to cut prices slightly to secure orders, and the experience of large buyers in the past few months has been such as to cause them to look for supplies at present at price recessions.

Fine papers are fairly active and display increasing price firmness. The demand is slowly but consistently widening, and the advance in raw material costs is an important factor in creating firmness in writing paper values at the moment. Tissue papers are in routine movement and quotably steady.

Building papers are in a livelier market position than probably ever has been noted during mid-winter. With open weather prevailing in most parts of the country, building operations have continued uninterrupted, and a big movement of roofing felt and sheath-

GOOD PAPER
—GOOD RESULTS

The effectiveness and pulling power of Direct Mail literature depends entirely on the proper selection of Paper. The finest illustrations possible or the best copy cannot get your message across if produced on paper that cannot stand the strain.

FRANKFOLD Enamel

a paper built for a purpose, will answer the requirements unusually well. The extra long, firmly knitted fibres assure good folding qualities and a required sturdiness. The beautiful and uniformly smooth surface will faithfully reproduce the sharp details of mechanical subjects or the subtle shades of color work.

FRANKFOLD ENAMEL preserves that freshness and inviting appeal so essential to successful direct-mail literature.

We will gladly forward some printed specimens or blank sheets for dummy purposes.

ing papers is reported. Reports state that the large manufacturers of roofing felt put into effect on February 1 an advance of $12 a ton in the price of felt.

Sack papers also are in good demand, reflecting the high price of cotton and other textiles. Most mills producing bag papers are reported well engaged and booked ahead on orders.

Paper boards are in limited demand and quotations tend downward. Mills in the East are quoting at about $45 a ton f. o. b| New York for plain chip board, and $50 a ton for news board but the probabilities are these prices are being shaved in some instances.

The monthly statistical summary of the paper industry issued by the American Paper and Pulp Association shows that a total of 370,605 net tons of paper of all kinds was produced by United States mills in December, compared with 302,792 tons produced in November last, indicating a very healthy increase in spite of the holidays during the final month of the year. Shipments from mills in December totaled 363,282 net tons, or but slightly below the total output for the month, while mill stocks of paper of all kinds at the end of December amounted to 218,036 net tons, contrasted with 213,306 tons at the end of November.

Exports of paper of all grades from the United States in November, 1923, totaled in value $1,926,607 compared with exports of $2,118,841 during October last, and $2,012,689 in November, 1922, according to figures issued by the U. S. Department of Commerce.

Mechanical Pulp

Prices of mechanical pulp seem to have steadied at around a basis of $35 per ton f. o. b. grinding mills. In fact, in some quarters prices show a strengthening tendency, due, it is stated, to less favorable weather conditions for grinding and a resultant decline in production. Canadian producers are reported to have marked up quotations in some cases to around $38 a ton f. o. b. pulp plants, and even slightly higher rates have been secured, it is said, in instances where a low freight from producing to consuming points has been involved. Demand for ground wood is fair. Newsprint mills are buying in a steady manner, and board manufacturers and other consumers are absorbing supplies in at least moderate tonnage, so that grinders are experiencing fair business. However, a surplus of pulp has been accumulated in some quarters and it is this, it would seem, which is creative of the easiness in prices recently noted.

Foreign and Domestic Chemical Pulp

Consumers of chemical wood pulp are still lagging behind as purchasers and are absorbing supplies in a limited way. Very little interest is shown in other than lots for immediate needs, and since this condition exists at the buying end while on the selling side there are those who are anxious to move some lots of pulp, it is plausible why prices are anything but firm and why buyers in a majority of cases are succeeding in filling their present wants with pulp obtained at price concessions.

There have been reports of sales of foreign kraft pulp at less than 2.50 cents per pound ex dock New York or other American Atlantic ports. Most importers are endeavoring to secure around 2.60 cents for No. 1 foreign kraft but buyers are not willing to meet this figure as a general thing. Unbleached sulphite of foreign origin is quoted at 2.60 cents upward on the dock New York, but sales at cheaper prices have also been reported. Bleached sulphite is moving in moderate amounts yet sellers are said to be finding it necessary to shade asked rates to get orders. Quotations ex dock New York and f. o. b. pulp mills are:

Sulphite foreign—		
Bleached No. 1	4.00 @	4.50
Unbleached No. 1	2.60 @	2.80
Unbleached No. 2	2.40 @	2.60

Kraft, domestic	2.60 @	2.90
Sulphite, screenings, refined	1.50 @	1.75

Domestic Rags

Papermaking rags are in a strong market position. Nearly all grades are wanted by mills in good volume, and dealers are repeatedly marking up prices and are securing the rates quoted in most instances. Roofing rags are at higher price levels than have been reached in a long time. Sales of No. 1 roofing stock have been made at 2.25 cents a pound f. o. b. New York, while No. 2 packing has brought 2.15 cents; in fact, there have been reports of sales at even higher figures. The sharp advance in rags of this class has served to strengthen the value of other grades, and old blues and whites are on the move upward in price. Sales of repacked thirds and blues are reported at 3.25 to 3.50 cents a pound at shipping points, and of miscellaneous packing at 2.75 cents. New cuttings are firm and advancing. Some grades are hard to locate in usual amounts and it is these which are particularly strong in price. Quotations f. o. b. New York are as follows:

New Shirt Cuttings, No. 1	14.00	@	14.50
No. 2	6.75	@	7.00
Fancy Shirt Cuttings	7.50	@	7.75

Roofing Rags, No. 1	2.20	@	2.30
Roofing Rags No. 2	2.10	@	2.20

Imported Rags

Demand for most grades of foreign papermaking rags is said to have subsided somewhat yet there is a firm tone to prices, and importers in general say they are well sold up for quite a period. Moreover, it is asserted that offerings from abroad are small in both number and volume and this has a bullish influence on values. Dark colored cottons for roofing paper mills are especially firm and have sold at 2.10 cents a pound ex dock New York. Blues are in good demand and quotably strong, as are the various grades of modern foreign new cuttings. Quotations ex dock New York are:

Lins., White, No. 1	13.50	@	14.00
Ger. Blue Cottons	3.25	@	3.50
French Light Blues	3.50	@	3.75

German Light Prints	4.00	@	4.25
Dk. Colored Cottons	2.00	@	2.15

Bagging, Rope, Etc.

Old rope is marked by a fairly consistent demand from paper mills and prices are firm. Domestic manila rope is reported selling at 6.50 to 6.75 cents per pound f. o. b. New York, and foreign manila rope is fetching about 6.25 cents ex dock at this port. In old bagging, demand for roofing bagging is the market feature. Sales of this grade at 1.10 to 1.20 cents a pound f. o. b. New York have been noted, while No. 1 scrap bagging is quoted at 1.25 to 1.50 cents with not much demand recorded. Prices f.o. b. New York follow:

Gunny No. 1	1.50	@	1.60
Foreign	1.40	@	1.50
Wool Tares, light	1.20	@	1.40
Wool Tares, heavy	1.40	@	1.60
Scrap, Bagg., No. 1	1.25	@	1.50

For. Manila Rope	6.25	@	6.50
Domestic Rope	6.50	@	6.75
Mixed Strings	1.00	@	1.25

Old Paper

There is a fairly good call for a few grades of old paper and very little buying interest in others. Consumers apparently are purchasing to cover direct requirements only and most of the orders placed involve limited tonnage, yet it cannot be said that the market is dull. Folded newspapers are moving well at 90 to 95 cents a hundred pounds f. o. b. New York, and old flat magazines are in better demand with dealers quoting between 1.50 and 1.75 cents per pound New York, depending on the quality of packing. Old kraft paper is firm at 2.15 to 2.25 cents a pound, and a steady inquiry continues for white blank news cuttings at about 2.25 cents per pound f. o. b. New York. There isn't much activity in shavings, and quoted prices are stationary, No. 1 mixed paper is selling at 65 to 70 cents a hundred pounds New York. F. o. b. New York quotations are:

No. 1 Hard White Shavings	3.75	@	4.00
No. 2 Hard White Shavings	3.25	@	3.50
No. 1 Soft White Shavings	3.00	@	3.25

Manufacture of Pulp and Paper

IN FIVE VOLUMES

Being prepared by the Joint Committee on
Vocational Education of the Pulp and Paper Industry
Volumes I, II, III and IV now issued.

Volume V is expected during the year.

The work is adapted to the classroom, to home study and for use as a reference work. Every firm and individual connected with the industry or interested in the pulp and paper business should own one of these sets.

The volumes issued are on sale at $5 a volume and orders may be placed with the Technical Association of the Pulp and Paper Industry, 18 East Forty-first Street, New York or with Hughes Publishing Co., Inc., Suite 418, 1478 Broadway, New York.

A ROLLING STONE GATHERS NO MOSS

BUT, Paper rolled by Press Rolls of Barre Granite gathers increased profit for those whose machines are equipped with these famous rolls. Full information about them will be sent upon request.

JONES BROTHERS CO.

BARRE, VT. BOSTON, MASS.

Preserve Your Copies of Paper

Handsome binders to hold a complete volume of PAPER will be sent postage paid on receipt of price.

Binders in half leather with gold ornamentation $1.75

Binders of serviceable buckram that will last a lifetime........ $1.50

All orders should be accompanied with check or money order made payable to

Hughes Publishing Company

Room 418, 1478 Broadway,

NEW YORK, N. Y.

Twines

Manufacturers report a fair demand for this time of the year for twines but state that consumers with a few exceptions are buying merely against urgent requirements. The price tone is firm, due in large part to the strong position of raw material, sharp advances having been noted recently in jute, hemp and other cordage fibers. Quotations are as follows:

Sisal Hay, pure	12.25 @	13.25
Manila Hay, pure	16.25 @	17.25
Sisal Lath. Yarn	12.25 @	13.25
Manila Rope, pure, ¾ inch diameter	14.25 @	15.25
Hardware Rope	11.25 @	12.25

B. C. Hemp, 36	.37 @	.38
America Light India—No. 6	14.50 @	
No. 7	13.50 @	

Chemicals

There is a fair movement of papermaking chemicals and at maintained prices but activity in the market is chiefly against contracts or back orders, new business developing slowly. No changes of consequence are reported in quotations.

IMPORTS AT NEW YORK

Week of January 28-February 2

Paper

Str. Rotterdam, Rotterdam—Keuffel & Esser Company, 13 cs. drawing.

ORR FELTS and JACKETS

Lowest Cost per Ton

If you judge felt values, not by what you put into the equipment, but what you get out of it—then you will specify ORR 3 stripe Endless Felts for ORR felts will produce the lowest cost per ton. They "stand up" under severe usage. Orr durability is acknowledged everywhere. Their strength and long life are as dependable as their reliability and quality.

In the 32 grades of Felts and Jackets we can match your most exacting demands. Tell us the kind of paper you desire to make, and we will send you samples of felts that will economically serve you and help you to produce paper at lowest cost per ton.

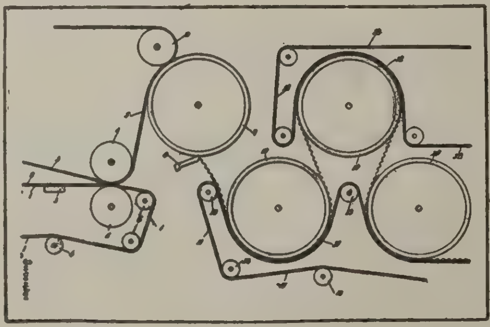
Improved Process of Creping Paper

The Best and Most Profitable

For the manufacture of CREPED PAPER Napkins, Toweling or Stretchable Bag Papers and Creped Packing or Crepe Wrapping Papers the system has no equal



The crepe being formed while the fibres are steaming hot and pliable is dried without stretching; not only retaining form better, but shedding less lint than cold creped paper products.

For particulars address:

Tompkins-Hawley-Fuller Co.
VALATIE, N. Y., or OREGON CITY, ORE.

Hamilton Board Felts

OUR style No. 82 top felt and style No. 87 bottom felt have the bulk of the filling threads on the face of the fabric. This style of weave causes the felts to give a smoother finish and longer service than can be secured from plain weave board felts, besides shedding the water better. They do not "roll on the edge" and are billed at the same list and pound prices as are our plain board felts.

THE CLEARING HOUSE
OF THE PAPER INDUSTRY

Situations Wanted, Help Wanted, Machinery for Sale, Machinery Wanted, Business Opportunities, Materials Wanted and For Sale, Business Wanted or For Sale.

Advertisements in this department cost $1.00 for 25 words or less, payable in advance. Additional words, two cents each. This price covers the cost of remailing answers directed to boxes, care of this office. Matter for insertion should reach the office of PAPER not later than the Saturday preceding date of issue.

All Advertisements under the Situations Wanted or Help Wanted Classifications are published FREE OF CHARGE, except for cost remailing letters addressed here.

POSITIONS WANTED

GRADUATE CHEMICAL ENGINEER, 28, married, several years' varied experience, desires position as chemist in pulp and paper mill. Address Box 1255, care of PAPER.

JOB WANTED by plant engineer; boiler room cost reducer. Willing to work on basis of pay according to actual reduction of operation expense. Ohio license. Now employed. Age 35. Address Box 1254, care of PAPER.

MECHANICAL ENGINEER, 35 years of age, college graduate, twelve years experience as pulp and paper mill engineer, fully qualified to take full charge engineering department, is open for an immediate engagement in an executive capacity. Location immaterial. Address Box 1256, care of PAPER.

POSITION WANTED by German papermaker, superintendent, skilled in manufacture of all kinds of greaseproof paper, tissue paper and use of automatic delivery machines; tinted papers made by any process. Desires long term contract with adequate salary. Address H. H. 100, care of PAPER.

SALESMAN with college education, chemical engineer. Experience in paper and pulp mills. Successful selling record. Address Box 1259, care of PAPER.

GRADUATE MECHANICAL ENGINEER, seven years' experience in United States and Europe in design and construction in pulp and paper mill machinery and as field and maintenance engineer; perfect detail knowledge of De Vains process. Address Box 1260, care of PAPER.

PULP AND PAPER MILL ENGINEER —Technical graduate, married, aged 35; fourteen years' experience in applied structural and mechanical engineering of pulp and paper mills. Capable of assuming the technical responsibility of your plant from the drawing board to the erected job. Thoroughly familiar with all process. Correspondence solicited. Address Box 1261, care of PAPER.

Position as chemist or chemical engineer by University graduate, 30 years of age, married. Applicant has held responsible positions in laboratory, research, development and production work in several lines, including sulphite pulp and paper production. Employed at present, but available upon reasonable notice. Location immaterial. Address Box 1262, care of PAPER.

FOR SALE

FOR SALE—Unlimited quantities of finest pulpwood. F.o.b. mill in New York State, $23.75 per cord. Address Box 236, care of PAPER, 1478 Broadway, New York City.

POSITIONS VACANT

WANTED—One Beaterman in mill making Bond, Book and Writing—White and Colors. Send references in first letter stating last two places worked. Address Box 1264, care of PAPER.

A FIRST CLASS assistant board superintendent, with knowledge of colors and qualities. Address in confidence "H", care of PAPER.

WANTED—An experienced operating manager to take over entire charge of paper box board mill. Communicate with F. F. Brooks, c/o First National Bank, Pittsburgh, Pa.

MECHANICAL ENGINEER

The Vacuum Oil Company intends to add to its Technical Department Staff an experienced paper mill engineer. The position calls for a man having the following qualifications:

An engineer from 35 to 45 years of age who has had a technical education and a number of years practical experience in the actual operation of pulp and paper mill machinery. A thorough knowledge of the paper mill industry and ability to meet and talk with the technical representatives of the mills are essential qualifications. DO NOT CALL. Write us, giving a complete outline of your experience and qualifications, stating age and salary desired. VACUUM OIL COMPANY, Technical Employment Committee, 61 Broadway, New York City.

WANTED—Salesmen calling on the wholesale Paper Trade, to sell a line of Tape Moisteners, Envelope Sealers, Desk Memo Pads and Adding Machine Rolls. An attractive proposition for real salesman. J. F. Ryan & Company, 222 East 42nd Street, New York City.

FOR SALE

Beaters—One N & W 48x48 rolls, 21″-6″. Two iron tub rolls 52″x40″.

Bed Plates—Large lot, all sizes. New .

Calenders—One 7 roll 72″; one 9 roll 72″; one 5 roll 78″; one 7 roll open side 84″. One 7 roll 124″.

Calender Rolls—Large assortment, all sizes; one 14x86″; one 18x84″; one 18x100″ and many others.

Coaters—One 45″ Waldron, double coater, and others.

Cutters—One 38″ Guillotine.

Cylinder Moulds—One 36″72″; one 30″x52″; one 12″x22″.

Drives—One No. 1 Reeves Class E; two No. 3 Reeves Class E, 4 to 1; one No. 3 Class E; one No. 6 Large Reeves; one No. 10 Reeves, F-3 to 1 with extra disc.

Dryers—48x116.

Exhausters—One Sturtevant.

Fans—3 Hunberry; 2 Perkins.

Jordans—One N & W Monarch, with new shell two Horne; two Emerson, large size, one base; one N & W Pony, with extra plug.

Pulleys—One 98″x34″ face, double arm, modern, Iron pulleys; Cone pulleys for Marshall Drives.

Pumps—One dry suction Knowles 12x22x18; one 1000 gal. Blake Tank pump; two Lawrence Mch. Co.'s Class A 8″ high duty; two 6″ Emerson make; one 4″ Centrifugal; one Type 4 Gould 5″ triplex, self contained. Two Lawrence Machine Co.'s Class A, No. 4, double suction pump for high elevation or for low speed. Thoroughly rebuilt and ready for shipment.

Press Rolls—One pair new, one RC 18x80″; one Gun metal 18x81″; one 16x75″; one RC 15½x73½″.

Rag Cutters—Two No. 2 Daniels; one Perkins.

Screens—4-8 pl. New Success.

Slitters—One 86″ P & J.

Winders—One 86″ P & J; one 100″ P & J; one 112″ M & W.

Wet Machines—One N & W with cut offs, mould 30x52″; two spare moulds.

One set Dillion Doctors for 80″ calender rolls.

MILLS MACHINE COMPANY
Lawrence. Mass., U. S. A.

THE CLEARING HOUSE—Continued

POSITIONS WANTED

SULPHATE CHEMICAL ENGINEER desires position. Technical graduate with mill experience. Prefer minor position with opportunity to work under big men. Address Box 1267, care of PAPER.

ENGINEERING DRAFTSMAN — Single, 25, available now; educated M. I. T. '21 Civil Engineering; experienced instrumentman, topographic drafting, mill and hydraulic design pulp and paper mill development. $175 per month. Address Box 1269, care of PAPER.

CHEMICAL ENGINEER—has three years' laboratory, mill and executive experience making sulphite fine papers with a prominent and successful mill. 1920 graduate from a high grade university. Is aggressive, thorough and well met. Has executive tendencies and ambitions and would prefer connection as secretary to president, assistant superintendent, assistant chief chemist, assistant purchasing agent. Address Box 1270, care of PAPER.

GRADUATE CHEMICAL ENGINEER with five years' experience in the manufacture of pulp and paper, followed by five years of successful selling to the manufacturers of paper and textiles in New England, at present employed as sales engineer, wishes to connect with a concern selling either equipment or materials to the paper trade. The position desired is that of New England representative or assistant sales manager in charge of the selling of that portion of product which is used in the manufacture of paper. Address Box 1271, care of PAPER.

EXPERIENCED ADVERTISING AND Sales Manager with successful record for market analysis, research promotion and development work, capable of selling big men personally, and able correspondent and especially familiar with the selling of special machinery and paper box board manufacture and sales, desires to connect with an organization with which there is a real future or would be interested in representing independently manufacturers desiring greater sales development on a commission and drawing account basis or salary and commission. At present employed as Advertising and Sales Manager for a firm rated GAA. Address 1272, care of PAPER.

BEATERMAN, middle-aged, sensible and temperate, seeks situation; used to colors on all grades of paper; best of references. Address 1273, care of PAPER.

SUPERINTENDENT wishes to make change; has ten years' experience as superintendent of mills making sulphite, bond, book and writings in white and colors; can furnish best of references. Address Box 1274, care of PAPER.

FINANCIAL and SALES

assistance offered by broker to a paper specialty mill making limited tonnage. Reply to Box 1267, care of PAPER.

POSITIONS WANTED

PULP AND PAPER CHEMIST desires position; good analyst; also has had research and production experience. Can furnish references. Address Box 1275, care of PAPER.

BOSS MACHINE TENDER wishes position. Capable of taking complete charge of beater room and machine room; A1 on sulphite and sulphate and ground wood papers; understands running and upkeep of all Fourdrinier machines, with or without attachments; can furnish best of references; location immaterial. Address Box 1276, care of PAPER.

CHEMICAL ENGINEER, University graduate, wants position as chemist or assistant superintendent. Experience in sulphate and sulphite. Address Box 1265, care of PAPER.

Recent graduate in chemistry from a university supporting an excellent pulp and paper school, now employed in a pulp and paper testing laboratory, wishes position as assistant chemist in pulp and paper mill. Address Box 1266, care of PAPER.

College man, young, married, with mill and jobbing experience, wants to make connection with mill or merchant. Address Box 1263, care of PAPER

CHEMIST, graduate, qualified junior or senior duties, desires engagement, $125-$150 month. Address Box 1257, care of PAPER.

MISCELLANEOUS

WANTED—A paper company to locate a large pulp and papermaking plant in North Carolina, with a million cords of pulp wood deliverable at the plant at $3.75 a cord, a saving of $20,000,000. Lands for plants, **fronting deep water for deep sea** loading. Millions more cords of wood available very cheap. A clear stream of fresh water free for washing pulp. Address Box 245, care of PAPER, 1478 Broadway, New York City.

Norwegian exporting firm desires to connect with first class well connected firms of importers in New York and San Francisco for the sale of Scandinavian Woodpulps and Paper. Reply, with propositions and references to Box 1258, care of PAPER.

WANTED—One Lannoye Patent Pulper Size No. 2, manufactured by Rice, Barton and Fales of Worcester, Mass. Size No. 1 considered as an alternative.

MINNESOTA & ONTARIO
PAPER CO.,
Minneapolis, Minn.

"Papa," said the boy, "when you say in your advertisements that your goods are acknowledged by connoisseurs to be the best, what do you mean by connoisseurs?"

"A connoisseur, my boy," answered the great manufacturer, "is an eminent authority—an authority, in short, who admits that our goods are the best."

MILLS GATHERING IN TIMBER LANDS

Many Companies Getting Pulpwood Tracts in Their Control

MANY of the pulp and paper manufacturing companies with pulp and paper producing plants in eastern Canada are acquiring additional pulpwood tracts. Some of the companies have been the Brompton Pulp and Paper Company, Laurentide Paper Company, Bathurst Company, Nashwaak Pulp and Paper Company, St. Croix Paper Company, Fraser Companies, etc.

The Brompton Pulp and Paper Company acquired large tracts of pulpwood lands in Maine, New Brunswick and Quebec. The pulpwood, after being rossed at the English Lake rossing mill of the company will be shipped via the railroad to the mills at Brompton. The purchase by the Brompton Pulp and Paper Company, was one of the biggest land transfers effected in some years. Indications are that the company executives have in mind the establishment of a pulp mill at English Lake, in the not distant future.

By acquiring additional holdings of pulpwood along the Restigouche and Nepisiguit rivers, the Bathurst Company, have become one of the largest owners of pulpwood lands in eastern Canada. The holdings are in the provinces of New Brunswick and Quebec. Over two million acres of valuable pulpwood bearing lands are now in control of this company, which is controlled by United States capital. The company owns valuable pulpwood lands near its pulp mill and paper mill on the Nepisiguit River. It also owns lands on the Restigouche River and fronting on the Bay of Chaleur. On its own land, the company built the hydro electric station at Great Falls on the Nepisiguit River, the power from which station serves to operate in entirety all the industries owned by the Bathurst Company. Originally this company was known as the Bathurst Lumber Company. Besides owning three saw mills, the company operates a large pulp mill and a large paper mill. The woods operations of this company are extensive. The Nashwaak Pulp and Paper Company, another United States concern have acquired lands along the Nashwaak River and Miramichi River. It is believed the company plans on construction of a pulp mill in the Nashwaak territory, in addition to the St. John mill. The St. John mill was recently enlarged so that the capacity in mechanical pulp was increased one third. Aiding in this was the securing of additional water supply, obtained after considerable effort and loss of time.

* * *

Ran Plant Steadily

The New Ontario Colonization Company of Buffalo, N. Y., whose land office and mills are located at Jacksonboro, Ont., ran their plant steadily throughout 1923 and found that the demand for pulpwood and lumber was such that the cuts were kept moving nicely. The company have disposed of a fair proportion of their pulpwood and are expecting that the balance will move out during the winter and spring. W. K. Jackson, president of the firm, states that they are planning on putting in a stock equal to last year. They are looking for equally as good demand for their products during the coming eleven months.

HOMAS J. KEENAN, F.C.S., Technical Editor

ISMAR GINSBERG, B.S., Contributing Editor

A Few Stray Thoughts

WITH winter melting away—though it may have some unexpected powerful kicks left—and spring nearby, can't you feel that little yielding in the paper industry? It is there, anyway, whether you feel it or not.

Prices are getting firmer, the demand, is changing from a wraith of hope to a substantial thing you can see, inventory time is approaching an end, reports from the barometer of business, the steel industry, are extremely gratifying, everywhere there is more optimistic and not so many mere blank, dull looks.

Not that a wave of mighty prosperity is just around the corner for the paper industry. Far from it. But there is a little yielding, a little give that looks fine after this winter of discontent. Everything begins to look better. Hope is beginning to rise.

It is high time to get busy and lay your plans for the coming business, spring and summer. Just as you take inventory of your stocks now is the time to take inventory of those more intangible commodities, selling plans, a modified policy to meet new conditions. It will pay you to lay the groundwork now.

* * *

This is the time of year when those papermakers with any money in their pockets, hurry south and bask in the eternal summer of Florida. The rest of us stay north and wrestle with snowstorms and slushy streets. 'Tis the irony of fate.

* * *

So much of a stir is the De Vains Process making that PAPER is publishing most of the material upon which it can lay its hands. Another article appears in this issue. The De Vains Process as applied to America is a splendid topic of a discussion by some competent authority conversant with American problems. This periodical would be glad to publish such dissertation.

* * *

T. J. Keenan takes his pen in hand again as a book reviewer. In this issue he writes one of those individualistic reviews of Volume IV of "The Manufacture of Pulp and Paper." It is well worth reading. After you have read the review, you will want to read the book. This is the open season for good books in the paper industry. Next week Mr. Keenan will review that inspiring, informative volume of R. S. Kellogg which may be considered the Alpha and Omega of the news print end of the papermaking industry.

* * *

"The Effect of Pressure on Test Sheets" the leading article in this issue, is another of those worthwhile papers read at the Canadian convention. This convention set a high standard for the speakers of the annual convention of the American Pulp and Paper Association to emulate. E. P. Cameron and J. M. Payne know of what they write and that is half the battle. What these men advocate is valuable reading and will generate some keen thoughts throughout the land. They urge a definite specification of the basis weight of the test sheets used and the pressure applied in their formation, in any standard method for the strength testing of pulp.

Effect of Pressure on Test Sheets

Variations in the Pressures Applied to Sheets Used in the Strength Testing of Pulp Affect Strength of Ultimate Sheet

By E. P. CAMERON
and J. M. PAYNE

In a contribution from the Pulp and Paper Section of the Forest Products Laboratories of Canada on the effect of pressure on the strength of test sheets used in testing pulp, which was presented at the annual meeting of the Technical Section of the Canadian Pulp and Paper Association held in Montreal, January 24, 1924, E. P. Cameron and J. M. Payne advocate a definite specification of the basis weight of the test sheets used and the pressure applied in their formation, in any Standard Method for the Strength Testing of Pulp. Details are given in this article.

IN order to cover the varieties of pulp generally met with in strength testing the following selection was made: groundwood; sulphite (bleached and unbleached); kraft. The kraft and sulphite pulps were tested in both the beaten and unbeaten states. Soda and rag pulp had to be excluded as sufficient time was not available for their study and they were deemed of somewhat less importance from a testing point of view than those chosen.

Disintegration and Beating

The quantities of stock required for these tests proved somewhat inconvenient, being rather too small for the operation of the mill beaters and somewhat too large to be handled in the disintegrator and ball mill without entailing an excessive amount of work. The laboratory baby beater was therefore used and the degree of beating judged by microscopic examination, appearance, and feel. It was not a matter of importance whether all the pulps were beaten to the same degree or not so long as they showed the characteristics of well beaten pulp. It is for this reason that the results for beaten bleached sulphite are higher than those for kraft, the former having been beaten to a greater extent than the latter, though in both cases the effects of beating are very apparent when compared to the respective unbeaten stocks.

All the pulps used for these tests were disintegrated in the baby beater using a well raised roll and were only left under treatment long enough to insure thorough disintegration with a minimum of beating action.

With the sulphite and kraft pulps the slush stock from the beater was run through a small experimental flat screen to remove all undisintegrated portions and this screened stock used for the tests.

Five test sheets were used for each point on the curve, five bursts being taken per sheet. In all tests the curve for the 60lb sheet was developed first, the pressure being increased by increments of 20lb. The curves for the other basis weights of sheet were then tied into this one by increasing the pressure by increments of 40lb. In this manner a good deal of unnecessary work was eliminated without sacrificing the accuracy of the results. Where points on the curves appeared of doubtful accuracy the work was checked and rechecked until thorough confidence could be placed in it.

I—Groundwood Pulp

The groundwood pulp used in this work was donated for the purpose by the Bronson Company of Ottawa. It was ground from 100 per cent spruce, knife barked and using three pocket grinders.

It was attempted to manipulate a 30lb sheet of pure groundwood but such difficulty was encountered that this weight had to be abandoned. The sheet was so fragile that it had to be couched off the sheet machine on a blotter and the whole cut down to size without removing it. All attempts to handle this weight of sheet in the usual manner proved fruitless owing to its exceptional weakness.

The 45lb sheet was satisfactorily handled in the ordinary manner by using considerable care.

Shrinkage measurements gave practically identical results for all basis weights and all pressures.

Through a miscalculation of the amount of stock required it was found necessary to prepare a fresh batch to determine the effect of high pressure. This stock proved inferior to the first batch but the results obtained demonstrate the same points.

Analysis of Results

All the results show that the strength of the sheet is increased by increasing the pressure applied. This rate of increase is very rapid, amounting to over 100 percent for certain basis weights of sheet through the range of pressures used.

The basis weight of the sheet has no specific effect on the strength though it may be said that medium weights of test sheets (60 and 75 lb) show that most marked results.

The percentage of moisture extracted varies directly with the pressure applied.

On largely increasing the pressure applied it was found that the strength was still increasing, a result fully expected from the previous work in this field.

The most rapid increase in the strength appeared throughout the lower applied pressures, this point being of extreme importance from the point of view of a standard method.

II—Sulphite Pulp, Unbeaten and Unbleached

No difficulty was experienced in the manipulation of the sheets for this test, though the 30lb required to be carefully made to give goor formation.

The hand letter press sheets gave the highest shrinkage as would be expected but the variations in the remainder were negligible.

The effect of basis weight in this series is most marked for the lighter weight sheets, particularly the 30lb. In this case an increase of 100 percent in the strength is gained by applying a pressure of 100lb per square inch. The increase in the strength for the heavier weights of sheet is much less marked and varies very little for large differences of basis weight.

Again the increase in strength is most marked in all cases for the lower pressures applied.

The percentage moisture extracted increases fairly regularly with increases in the pressure applied.

III—Sulphite Pulp, Beaten Unbleached

This was the first test carried out to demonstrate the effect of increases in pressure applied on the strength of

the test sheets of a beaten stock. The stock was easily handled and gave sheets of excellent formation.

The percentage increase in strength is much less marked in this test than in the previous ones due to the much higher initial strength. The actual number of points per pound gained by pressure is approximately the same however, and this will be found to be true for the majority of tests.

The increase in strength is again noticeably much greater for the lower pressures applied becoming more or less constant above 60lb per sq. in.

The effect of basis weight is marked and of rather a peculiar nature. The 60lb sheets show undoubtedly the most marked results, increases and decreases from this weight resulting in a lessening of the effect.

Percentage moisture extracted follows the usual lines.

IV—Sulphate Pulp, Unbeaten Bleached

No difficulty was encountered in the manipulation of these tests.

The most noticeable point in these results is the regularity with which the strength increases in the applied pressure.

The effect of basis weight is negligible.

The points per pound increase remains the same as in the previous tests, though the percentage increase in strength is somewhat different.

The percentage moisture extracted is again normal.

V—Sulphate Pulp, Bleached Beaten

This stock was beaten until very much hydrated and gave a sheet, which was semigreaseproof. When carrying out the test at 1,000lb pressure the sheets adhered to the blotters so tenaciously that it was almost impossible to separate them. From the results obtained these sheets seemed but little stronger than those pressed at 200lb per sq. in.

The results obtained from this test are almost identical to those from Test No. 4 both as to regularity of the increase in strength, the total number of points per pound gained and the effect of basis weight on the results. The percentage increase in strength however is considerably lower due to the higher initial strength.

The percentage loss of moisture is fairly regular in all cases.

VI—Kraft Pulp, Unbleached Unbeaten

In the formation of these sheets for this test considerable care was necessary to obtain uniformity. This was caused by the tendency of the unbeaten stock to mat together while in suspension, thus forming great spots of clotted stock in the finished sheet.

The effect of pressure on the strength of these test sheets is much more marked than in any of the pulps previously tested, this being true both of the points per pound and the percentage increase in strength.

The effect of variations in the basis weight is also very erratic though seemingly well defined. From the results obtained the 45lb sheet seems to give the best results.

The percentage loss of moisture is quite regular.

VII—Kraft Pulp, Unbleached, Beaten

The beating treatment given to the kraft pulp was not sufficiently severe to develop its maximum strength, because of the difficulty in controlling the baby beater used for the purpose as it was found necessary to dump the stock before it was thoroughly beaten for fear of cutting the fiber too drastically and thus spoiling its strength. The results therefore seem out of proportion when compared with those obtained from bleached sulphite pulp but nevertheless they show quite distinctly the points which were sought.

Analysis of Results

Although the results from the 60lb sheet are very erratic it may be said that this weight is optimum over the majority of pressures used, either increases or decreases from this point lessening the effect. The total increase in the points per pound is somewhat greater than obtained in other varieties of pulp and the increase is quite regular throughout.

Chart 8 shows how varying the pressure applied affects the different varieties and conditions of pulps tested. In all cases the basis weight of the sheet was 60lb together with the usual constants for the other charts.

Summary

A series of tests were carried out to determine the effect of pressure on the strength of test sheets from sulphite pulp, unbleached unbeaten; unbleached beaten; bleached unbeaten bleached beaten; groundwood pulp, unbleached unbeaten; kraft pulp, unbleached unbeaten, unbleached beaten.

From the results obtained the following general conclusions may be drawn as applying to all the pulps examined:

(1) Increases in the pressure applied develop increases in the strength of the resultant test sheet; this developed increase in strength being continual over a very great range of pressures.

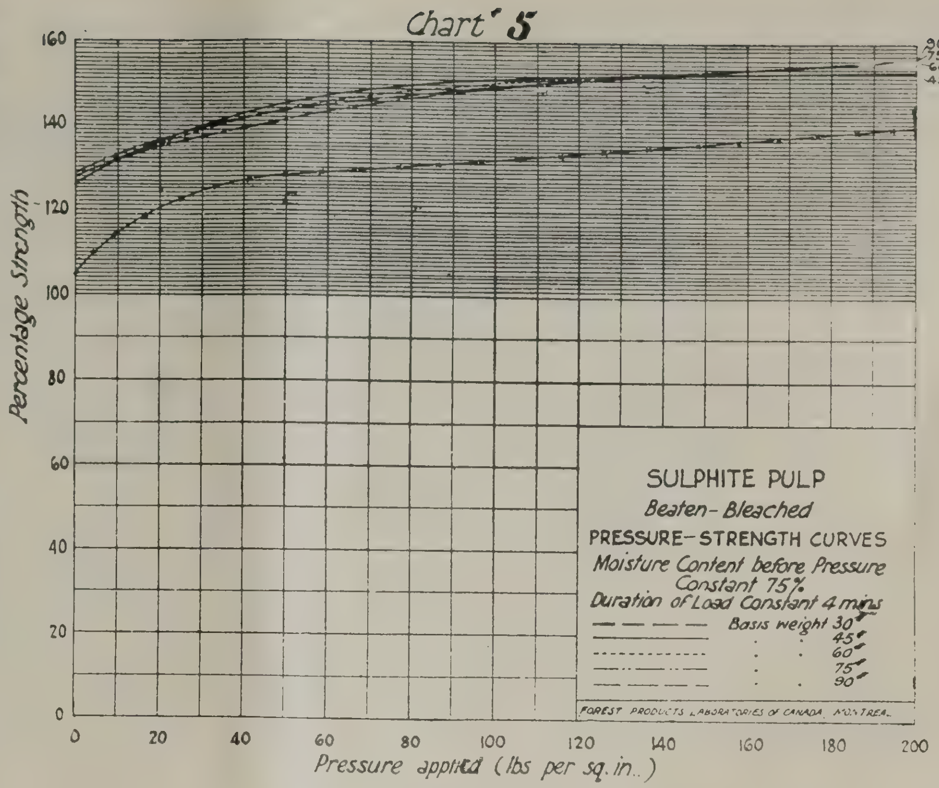
(2) The effect of the basis weight of the sheet on the resultant strength is variable and depends upon the variety of pulp being tested. Considering all the varieties tested it may be said that a 60lb sheet is the most satisfactory from the point of view of strength developed and ease of manipulation.

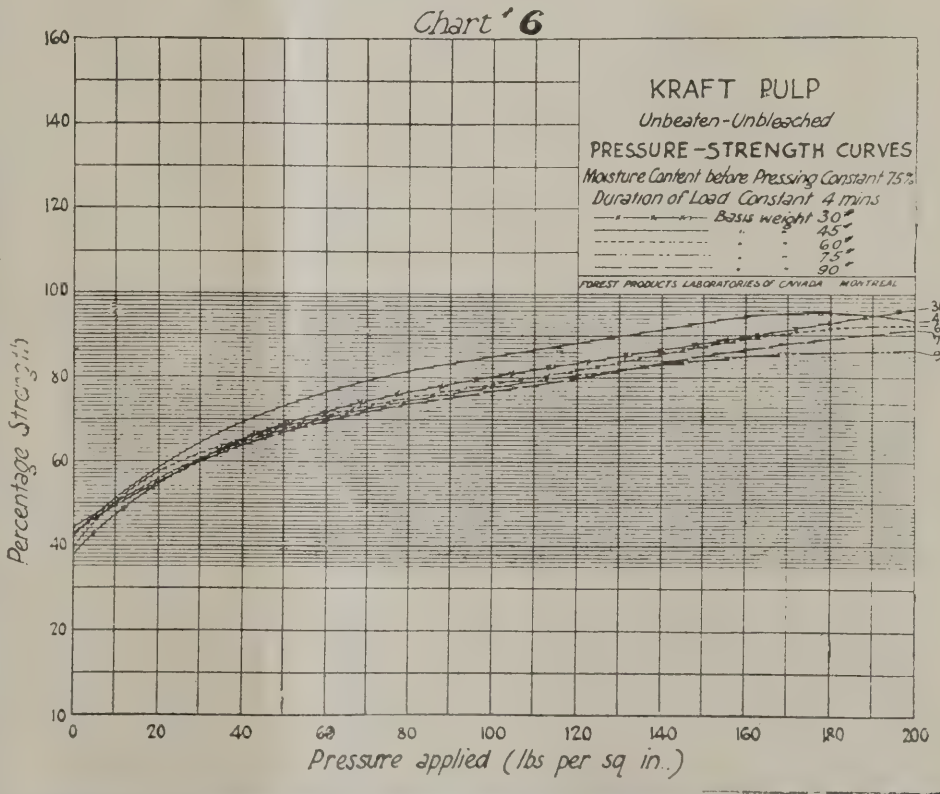
(3) The rate of increase in strength varies with the varieties and condition of the pulps being tested, but in all cases this rate becomes uniform for pressures above 100lb per sq. in.

(4) The increase in strength in number of points per pound remains fairly constant for all the varieties and conditions of pulp tested except in the two instances of unbeaten kraft and groundwood. The unbeaten kraft shows the remarkable increase of 55 points per pound while groundwood gives the lowest increase, 17 points. The remainder seem fairly constant between 25 to 30 points. (Results taken from 60lb sheet in all cases, see chart).

(5) The percentage loss of moisture increases with the pressure applied in a comparable manner for all varieties and condiitons of pulp tested.

(6) The effect of pressure on the thickness of the sheet was found to be negligible for the conditions of testing used and the test was abandoned.





Conclusions

In the delineation of the conditions for a "Standard Method of Testing Pulps for Strength" it seems imperative that the pressure applied to the sheet during formation be definitely specified. A pressure of 200lb per sq. in. was found ample to insure that this effect would be regular for all pulps tested and although this could safely be reduced yet from the point of view of reliability of the test a pressure of at least this amount should be used.

The effect of variations in the basis weight of the sheet is not sufficient to counteract the advantage of a single basis weight for all pulps and from the results obtained that of 60lb seems most satisfactory. It is therefore recommended that these two factors be specifically stated in any Standard Method for the Strength Testing of Pulp, as in the accompanying table.

(1) That the test sheets used should be of a basis weight of 60lb per newsprint ream.

(2) That in the formation of the test sheets a pressure of 200lb per square inch maintained for two minutes be adopted.

PAPER INDUSTRIES EXPOSITION PROGRESSES

Fine Collection of Watermarks to be Feature of Industries Exposition

THE finest collection of watermarks ever collected is planned as an educational feature of the Second Paper Industries Exposition, to be held at the Grand Central Palace, New York, the week of April 7th, and scores of letters have been sent by the management asking mills and big corporations to assist in collecting a representative series of special watermarks, particularly those on paper made for large business organizations which have either the firm emblem, names, symbols or picturization of the firms' products marked in the paper. A good start has already been made on the collection, those already secured including a number of early religious marks, several early regal marks and quite a collection of modern watermarks in the stationery of business firms.

These marks have inherent advertising value and the management will consider it a favor on the part of any concern which sends in such marks. The collection is being arranged with two plain sheets of the paper containing the watermark. Charles F. Roth, one of the managers of the Paper Industries Exposition has been interested in this question from an historical standpoint and stated that an exhibit made up of such marks would be of much educational value to the public.

A daily motion picture program will be part of the week's "Paper Show" and a list of films pertaining to paper manufacture, woods operations of paper companies, the production of specialties, and general forestry will be included. This was one of the interesting features of the Exposition last year, and the program for each day of the exposition week is already being tentatively arranged. If possible every paper film ever produced will be shown some time during the week.

Meanwhile, space for the Exposition is being taken daily, until even now, two months in advance of the paper show, half the available space is already under contract. One of the interesting new developments is the taking of space by some of the big electric companies which have been specializing in the installation of synchronized electric drive for paper machines.

"The vital importance of the paper manufacturing industry to the Connecticut Valley inspires the belief that the locality will be adequately represented when the annual exposition opens," says an editorial in one of the big Springfield, Massachusetts, newspapers, indicating the interest taken in the Exposition in that region, the biggest center of fine papermaking in the world. The editorial comment followed a description of the project and references to the extent of the numerous visitors who saw the first exposition in 1923.

More About The De Vains Process

Further Thoughts About the Process That Is Attracting Much Attention

By JAMES STRACHAN, F.Inst.P., F.R.M.S.
Chief Chemist to the Donside Paper Co., Ltd.

IN a previous communication Mr. Strachan gave a general outline of the De Vains process for the manufacture of bleached cellulose, with a short account of the history of the invention and its applications. See PAPER, January 24. Concerning certain statements made therein, he has been asked the question: "How can the De Vains process be applied by British papermakers who already have valuable plants for the production of pulp by the soda process?"

In reply to this he says it should be noted that the De Vains inventions include two very important units (1) an economical and compact electrolytic plant for the production of caustic soda liquor and chlorine, the latter in the form of chlorine water or hypochlorite of lime, and (2) a practical chlorination plant for the application of the Cross and Bevan chlorination process, without loss of chlorine and perfect regulation in its use. The electrolytic unit may be used with advantage in any paper mill, for the cheap production of caustic soda liquor and bleach-liquor. In this case an existing recovery-plant may be used for the production of surplus black ash, and there are well-known advantages accruing from the use of electrolytic hypochlorite. Many mills in America have already adopted electrolytic plant, other than De Vains, for the latter reason alone.

With regard to the application, however, of the De Vains process and plant complete, involving the chlorination process, there are certain circumstances and projects demanding the careful consideration of its economical application. These are as follows:—

1. The installation of plant for the production of cellulose from waste materials at present used in the manufacture of brown paper, such as flax waste and hemp.
2. The manufacture of pure cellulose for the manufacture of artificial silk and explosives.
3. The production of a workable straw pulp in certain areas of this country.
4. The addition of straw or esparto plant to wood pulp paper mills. For example, a mill bleaching 200 tons per week of sulphite pulp could replace 50 tons of the wood pulp with advantage by straw or esparto pulp and have the electrolytic plant so designed that a sufficient surplus of bleach-liquor was produced to bleach the whole output of the mill (including the wood pulp).
5. The project of installing a complete unit for the manufacture of esparto and straw papers, including a paper machine designed to run at much higher speeds than those at present used in the manufacture of printing papers.

The chief application, however, of the De Vains process, in the future, lies in the manufacture of bleached pulp from new fibres in tropical countries, and from straw in the great cereal growing areas of the world, where water-power is available. In this respect De Vains plant must be regarded as the first practical method of tapping such supplies, long talked of but hitherto largely neglected because of the expense connected with the transport of chemicals and the erection of expensive recovery plants for their conservation.

So long as water power is available the steam is required only for digestion and drying of the pulp or paper, and where coal or other fuel is not to hand this may be obtained economically from electrical boilers.

The first plant on the De Vains system for dealing with this problem in a tropical country is now running in Java, where the raw material is rice straw. The first step, however, towards carrying out such a project on a fairly large scale has now been arranged for, and will take the form of a mill producing 50 tons of bleached straw pulp a day in one of the wheat growing districts of Canada. The site fixed for this mill is near to Winnipeg, and when this is completed we will have an interesting event in the history of modern papermaking, viz., the first practical step towards drawing on cereal waste and conserving timber. Experiments already completed with Canadian straw show a superior fiber to that prepared from European straw, and a yield about 5 percent higher than that obtained by the ordinary soda process.

With regard to the rationale of the De Vains process and its applications, technical criticism may be directed under three heads: (1) materials used; (2) engineering design of the plant; (3) chemical considerations. In an article of this kind I can only deal with these briefly, and from my own point of view as a chemist with some experience of both papermaking and engineering.

First, with regard to raw materials treated; up to the present, these have been largely materials available in France, viz., esparto and straw. The application of the process to straw and similar materials on a large scale abroad must re-open the question of the Cross and Bevan classification of cellulose from a practical point of view. Celluloses from graminaceous plants, thanks to this laboratory classification, have been placed in the lowest category, and held suspect from the point of view of permanency. Yet from the practical point of view every large user of paper knows that a first class esparto paper is superior in every way to a wood pulp paper, which fact the authors of the above-mentioned classification admitted in deed, if not in word by printing their "Text Book of Papermaking" on an esparto paper. The fact is that the source of the cellulose is not nearly so important as the process used for isolating it and its subsequent treatment during manufacture. I have in my possession straw papers a century old, and esparto papers over half a century old, which compare favorably with more modern wood pulp papers. I believe there is more really ancient history written on papyrus reed than on any other kind of paper. In fact, the only reliable method of valuing the permanency and durability of paper is by comparative physical tests before and after artificial methods of ageing.

Many plants present complex structures combining in one stem woody, straw-like and rag-like elements. The utilization of such plants for the production of papermaking materials by the ordinary processes involves the destruction of part by drastic methods of digestion or fermentation, but with the chlorination process the maximum yield is obtained. For this reason the De Vains process is more universal in its application and gives higher yields.

In the second place, with regard to the construction of the plant; in spite of the fact that the French papermaking engineer has a more limited experience in many matters than those of some other countries, the arrangement of the plant on the whole is very good indeed. In France I was greatly surprised to find that De Vains use a system of forced circulation in the digesters (of French make), and I feel certain that this is a point neglected by British papermakers. So far as I know there are only three mills in Britain using forced circulation in their digesters, and in only one of these is the installation modern and extensive. Forced circulation effects considerable economy in consumption of soda, yet the old-fashioned Sinclair type of boiler is still apparently the conservative British standard! In other matters I believe English and American design and practice will improve some of the French details.

With regard to chemical aspects of the process the chlorination method has suffered some criticism chiefly because in the past most of the attempts have been done by the application of gaseous chlorine which is difficult to control. In certain cases this resulted in intensive action with partial destruction of the cellulose. In the De Vains process the chlorine gas is dissolved in water and under perfect control, while the degree of chlorination required may be controlled by the digestion, the consumption of soda and chlorine being interchangeable and variable factors. This is very convenient when an excess of either soda or chlorine is required for other purposes.

Some chemists (including Schwalbe) have stated that chlorine water attacks cellulose. Practical trials on straw have disproved this opinion and demonstrated that in practice chlorine water has no appreciable action on straw cellulose.

The following are the detailed results of these experiments which have already been published in France*:—

Experiment No. 1 on Straw.

Digestion with 8 percent caustic soda.

Chlorination with 12 percent chlorine.

Bleaching with 5 percent chlorine as hypo-chlorite.

The analysis of the pulp showed:

Alpha cellulose	64.38%
Beta cellulose	14.30%
Pentosans	26.97%
Ash and silica	1.50%
Copper number	4.78%

In the second experiment the same straw was treated with much less soda and an excessive quantity of chlorine as follows:—

Experiment No. 2 on Same Straw.

Digestion with 4 percent caustic soda.

Chlorination with 32 percent chlorine.

Bleaching with 5 percent chlorine as hypochlorite.

The analysis of the pulp showed:—

Alpha cellulose	62.25%
Beta cellulose	13.30%
Pentosans	23.50%
Ash and silica	6.95%
Copper number	4.75%

The increased amount of silica in No. 2 is, of course, due to the decreased soda. It is at once noted the copper value of the cellulose has not altered by the excessive chlorination thus proving the inaction of the chlorine on the cellulose, apart from the analytical yields.

I have already remarked on the purity of the esparto and straw pulps obtained in France by the De Vains process. Papers made from these pulps also showed under the microscope fewer parenchyme and epidermal cells than British papers of similar origin. These non-fibrous elements are non-existent in the case of esparto. This gives increased bulk to esparto featherweights. These elements do not disappear in the chemical process but are removed in the washing process, which the French papermaker insists on doing very thoroughly. (In my opinion the French papermaker spends too much time over both washing and bleaching.) The loss of these elements, although increasing the papermaking value of the fiber, brings down the yield so that in the case of esparto grass the gain in yield effected by the De Vains process is partly nullified by loss in washing. A strictly comparative test shows an increased yield of pure cellulose in the case of both esparto and straw.

In the case of straw pulp by manipulation of the digestion and subsequent processes De Vains has produced three kinds of straw pulp: (1) soft, like esparto; (2) intermediate, like wood; and (3) very greasy and suitable for making parchment-like papers.

The latter may be mixed with other pulps such as woodpulp to gain characteristics obtained only in woodpulp itself by excessive beating.

The most important criticism I have been called upon to make in connection with the De Vains process lies not in the chemical control, but in the physical operations necessary to obtain proper chemical reactions. The critical stage is that between digestion and chlorination, where the fibrous materials must be reduced to a phyiscal and mechanical consistence and uniformity, suitable for rapid and thorough chlorination. Straw is easy to manipulate, but other fibers require more attention at this point.

Sixth Southern Forestry Congress

David L. Goodwillie, chairman of the Forestry Committee of the National Chamber of Commerce, was a principal speaker at the sixth annual Southern Forestry Congress, his subject being the responsibility for forestry. He urged that the Weeks law be amended to allow the government to take over any land suitable only for forest growth, and that more adequate steps for fire prevention should be taken in all parts of the country. That France can show the way to America along forestry lines was the statement of Col. W. B. Greeley, chief of the U. S. Forest Service. J. S. Holmes of North Carolina was elected president, and resolutions urged the passage of the McNary bill by Congress, the extension of forestry education in the south, and the continuance of reforestation experiments in the various states.

PAPER PRODUCTION TOTALS FOR 1923

Over Seven Million Tons of Paper Produced During the Year, Statistics Show

FIGURES compiled by the American Paper and Pulp Association in co-operation with affiliated organizations of paper manufacturers indicate that the total production of paper of all grades in the United States in 1923 was approximately 7,200,000 tons. This total is larger than the production of any other year in the history of the industry, except 1920, when the total was 7,334,614 tons. It is somewhat larger than the production of 1922, which was 7,017,800 tons, and is distributed among the chief grades as follows:

Grade	Tons
Newsprint	1,506,204
Book	1,078,783
Board	2,251,079
Wrapping	1,002,905
Fine	364,552
Tissue	181,948
Hanging	91,489
Felts and Building	410,693
All Other	310,390

While these figures are estimates, being based on the incomplete figures provided by the mills which are co-operating with the various associations of the industry in the compilation of production statistics, yet no more accurate figures will be available until the 1923 United States Census Reports are issued. Figures were compiled by the Federal Trade Commission during the first five months of the year, and when the Commission ceased this compilation, the task was assumed by the American Paper and Pulp Association, which has had the co-operation of the large majority of the mills of the country, represented either individually or through the associations of the various groups of the industry.

Completes Committee

A. H. Campbell, Traffic Manager of the International Paper Company, New York, chairman of the Paper Committee of the Middle Atlantic States Regional Advisory Board, has completed the organization of his committee as part of the movement of shippers and receivers of freight to promote an understanding of transportation problems and to adjust informally transportation difficulties. The committee is made up, in addition to Mr. Campbell, chairman, as follows: L. H. Palmer, Traffic Manager, Curtis Publishing Company, Philadelphia; Stuart H. Brown, Assistant Secretary and Traffic Manager, Union Bag and Paper Corporation, New York; Warren B. Bullock, Director, Information Service, American Paper and Pulp Association, New York; C. C. Furgason, Traffic Manager, West Virginia Pulp and Paper Company, New York; George Lucas, Director of Transportation, National Publishers Association, New York; H. F. Masman, Traffic Manager, National Association, of Waste Material Dealers, New York; C. H. McIntyre, Traffic Manager, Dill and Collins Company, Philadelphia; Joseph A. Quinlan, Traffic Manager, St. Regis Paper Company, and Hanna Paper Corporation, Watertown, N. Y., and S. M. Williams, Chairman Traffic Committee, American Newspaper Publishers Association, New York.

The Degree of Porosity of Paper

Some New Ideas on an Important Topic by a Well Known European Authority

By V. RAVIZZA

Originally Published in Industria della Carta

THE determination of the degree of porosity of paper is an important task when testing such papers as are manufactured for special purposes where the ease with which the paper will allow gases and liquids to pass through its structure is of considerable significance. Thus for example the class of papers that is used in wrapping food products must be tested to ascertain their capability of allowing air to penetrate through them. Then again in the manufacture of papers which are used for electrical purposes, the determination of the porosity is of the greatest importance. Many electrical organizations have given particular attention to this phase of paper testing.

Devices Used Divided into Two Groups

It is possible to divide the various devices that are used for determining the porosity of paper into two general groups. The first group consists of apparatus in which the paper is subjected to the action of compression and the second group comprises those devices in which the principle of suction is employed. The more common types of apparatus, those which are most used in making this test, belong to the first group, while the more sensitive devices fall in the second group.

In the apparatus which work on the compression principle, the sheet of paper which is being tested is fixed over the upper opening of a receptacle while water is caused to enter the lower part of this receptacle so as to force out the air and push it through the paper. Naturally a record is taken of the time that it takes to cause a given volume of air to pass through the paper. This is the important factor in the determination.

Sindall Apparatus

Among the modern forms of apparatus used for this purpose the Sindall device, which is shown in figure 1, may be mentioned for the simplicity of its structure. A represents a bottle which has the bottom cut off. It is placed in a reversed position and the lower edges are smoothed off so that the sheet of paper can be firmly fixed to the edges by means of a rubber ring or metallic ring. In the lower part of the receptacle A there is introduced a small tube which is inserted through a one-holed rubber stopper. The end of the tube beyond the receptacle is connected to a siphon D by means of a short rubber tube. This siphon tube leads the water from the bottle C into the bottle A through the short rubber tube, and the level of the water in the bottle C is maintained constant by regulating the flow of water into the same so that no more leaves the bottle than is allowed to flow into it.

After the siphon arrangement has been put into action, the cock E is opened and air is allowed to enter the vessel A. The time that it takes to fill this vessel up to a certain mark is noted.

The Karstens Apparatus

Another apparatus which is constructed on the same principle is known as the Wikler Karstens apparatus. It is seen in figure 2. The piece of paper which is being tested is fixed in a convenient fashion over the upper opening of the graduated cylinder A, which is later lowered and fixed at the bottom of the cylinder B, which contains a certain quantity of air. The air which is compressed in the cylinder A escapes through the pores of the paper with a greater or lesser speed. This factor is very easy to measure by noting the time that is required for the level of the water in the interior of the cylinder A to rise to a certain height.

According to Herzberg the cylinder A will not be fixed at the bottom, but it will be left to itself and the time that is required for the water content of the two cylinders to reach the same level will then be marked.

Gurley and Troy Densimeter

The Gurley and Troy densimeter corresponds to that of Wikler and is used in the testing not only of papers but also of textiles, felts and the like. As is shown by figure 3 the apparatus is similarly constituted of two vessels in the form of cylinders. The movable cylinder A is the inner one and has a graduated scale on its outer surface and at the upper part there is an arrangement for holding fast a sample of the paper D which is to be tested. The exterior cylinder B has a base C which is furnished with holes so that the entire apparatus may be firmly fastened to the table.

After the vessel B has been filled with water, distilled water being used for this purpose, the cylinder A is put back into place. Then after the sample of paper has been firmly fixed in place, the cylinder A is raised as is seen in the figure, until the zero mark is above the top edge of the cylinder B. Then it is let down gently and then the time is measured that it takes for the cylinder to reach the 100 cubic centimeter or 500 cubic centimeter mark if the paper that is being tested is very thick and porous. The porosity of the paper is expressed in terms of the number of seconds that it takes for one hundred cubic centimeters of air to pass through five square centimeters of the free surface of the paper.

Disadvantages of the Apparatus

One of the faults that Herzberg has found with this type of apparatus is that it is necessary to make air pass through the paper, which air is more humid than the normal air, due to the fact that it comes in contact with water and absorbs moisture from it. The moisture in the air is easily absorbed by the paper the fibers of which swell up again and fill the pores or the small hair-like cracks that exist in the sheet

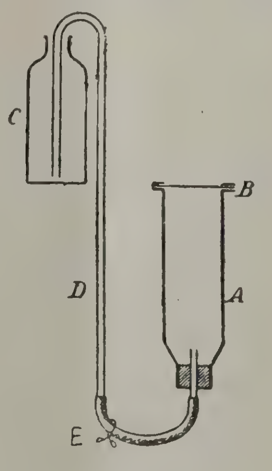

Fig. 1

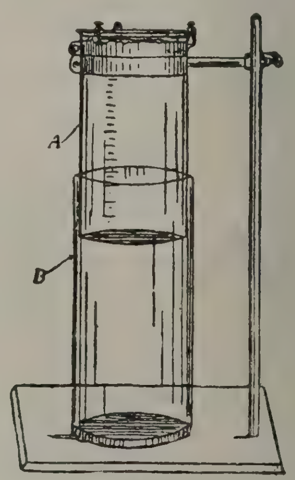

Fig. 2

of paper. If the test is prolonged the effect of the moisture in the paper is to decrease its porosity.

Another fault is that the pressure under which the air is obliged to pass through the sheet of paper does not remain constant. It diminishes as the test is prolonged.

It is possible to remedy the first fault by making use of a liquid other than water, or in covering the surface of the water with a thin layer of petroleum, as Sindall advises. The device which has been proposed by the Electro-Technical Association in England belongs to the second class of porosity testers that is the class of apparatus in which the ruling principle is the suction of the air through the paper sample.

The Suction Paper Porosity Tester

The apparatus which is used is shown in the accompanying figure. It consists of a vessel H which is arranged in such a manner that it can function as an aspirator after the liquid with which it is filled has been allowed to flow out of it.

In order to carry out the testing with the greatest degree of convenience, the liquid that is contained in H is made to flow into the container L, which is made in such a fashion that it can be raised or lowered at will. The way in which the device works is as follows:

After the cock F has been opened, the container L is placed above the apparatus on the ring N. It is then filled with water to the point M until the liquid in the graduated burette H just reaches to the zero mark on the same. Then the cock F is closed and the paper sample C is fixed between the frames A and B. The bulb L is lowered and then the cock F is allowed to remain open for a period of fifteen seconds. The time is accurately noted by the second hand of a watch. The level of the liquid in the burette H is then measured, care being taken to lift M to such a height that the level of the water both in M and in H is the same. This ensures a greater degree of accuracy in the readings.

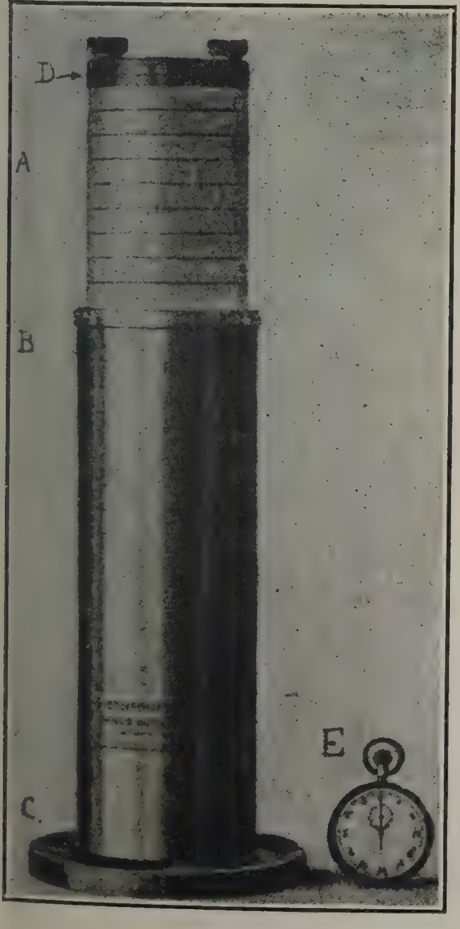

Fig. 3

In this case the surface of the paper that is tested is equivalent to a circle with a diameter of five centimeters. Ten tests on different parts of the paper are prescribed in order to arrive at a general average. According to the extent to which the column of liquid in the burette H is lowered, the vacuum within the same is reduced.

Another form of suction porosity tester is used in the Materialspruefungsamt in Berlin. In this apparatus the quantity of water that is aspirated during a given period of time through a surface area of ten square centimeters of paper through the effect of the aspiration of ten cubic centimeters of water. The quantity of water that passes through is measured by means of an instrument of the type that is employed in measuring the quantity of gas flowing in a pipe line. The suction is obtained by means of an ordinary pump or a water injector and is maintained constant through the aid of large bottles which act as reservoirs. The porosity is expressed in terms of liters of air which pass through 100 square centimeters of paper in a minute through the suction effect of a column of water 10 centimeters high.

* * *

The Advisory Council

Organization of an advisory council for the Northeastern Forest Experiment Station recently established at Amherst, Mass., has been discussed widely throughout the East, and a mass of correspondence has been received by S. T. Dana, head of the station.

On February 6, before the technical foresters gathered at Albany for the meeting of the local section of the Society of American Foresters, Mr. Dana indicated what type of men might be selected to represent the paper and pulp industry on the council, and stated that the central idea had met with unanimous approval.

The names suggested do not indicate in any way the size of the advisory council as it will eventually be announced in its final form, but it is of interest at this time to observe the available and very desirable sources of material for the advancement of the work which the council will undertake. Among those whose names have been submitted by the various groups in the northeastern states are: Col. Haskell of the International Paper Co.; George W. Sisson of the Raquette River Paper Co.; Hugh P. Baker of the American Paper & Pulp Association; R. S. Kellogg of the News Print Service Bureau; George N. Ostrander of the Empire State Forest Products Association.

Buy Waste Paper

More than 60 tons of waste paper, old magazines, etc., gathered by the pupils of the Hamilton, Ohio, schools has been the means of providing each of the buildings with steropticon paraphernalia to aid in the visual education program of Darrel Joyce, school superintendent.

The superintendent arranged the contest because he wanted the material and because the school funds are a little shy. School was arrayed against school and room against room.

About $1,800 was realized when the paper was sold to the Champion Coated Paper Co., and the Beckett Paper Co., both Hamilton shops.

Mr. Joyce is arranging another contest for March or April and he is hopeful that it will be more successful than the one just closed.

A novel feature was when one teacher provided some of her pupils with broomsticks with nails in the end. They spiked paper found on the street to and from school for three days and got more than 280 pounds.

* * *

Fire Prevention in Wisconsin

New advanced steps toward forest fire prevention in the districts of Wisconsin from which that states paper mills secure pulp wood have been taken by the Conservation Commission, the action being in no small measure due to the activity of the new Wisconsin Forest Protective Association organized by the paper mills under the suggestion of the American Paper & Pulp Association. Two fire prevention districts have been definitely established, with an area of 1,600,000 acres, and the six districts proposed will total 7,000,000 acres. The effort will be made to demonstrate that fire prevention is possible by intensive efforts over large areas.

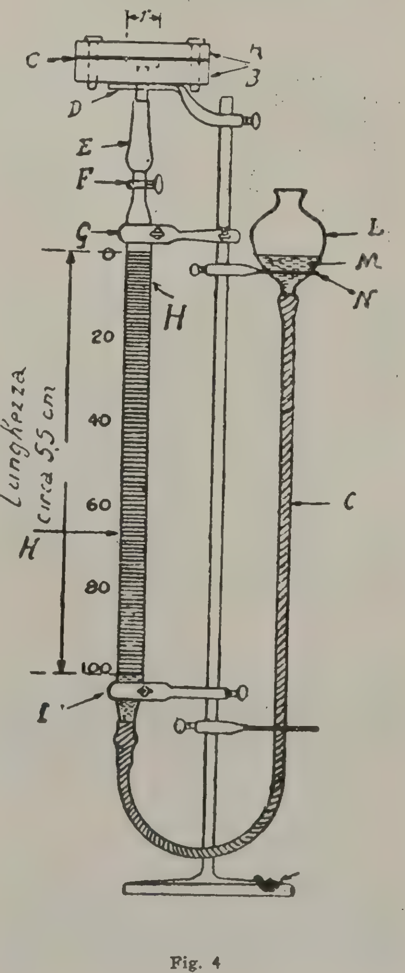

Fig. 4

With the Mead Pulp and Paper Company

A Review of the Activities of This Prominent Organization at Chillicothe, Ohio

By ERNEST AUGUSTUS

THE Mead Pulp & Paper Company of Chillicothe, Ohio, has recently placed an order with the Holyoke Machine Company for a new 146 inch super-calender. The Mead Company, at the present time, has included in its calendering equipment three stacks of 140 inches each; which, at the time of their installation in 1920, were heralded as being the largest super-calenders in any paper mill in the world. It is understood that the new calender just orderd cannot lay claim to this distinction, for calenders larger than this have been constructed since 1920. It was necessary for the Mead Pulp & Paper Company to add this calender to its equipment in order to keep up with the program for increased production outlined for the year 1924. It is hoped to have the new stack in operation sometime within the next few months.

* * *

A new 4,000 horse-power, 3,000 kilowatt, steam turbo-generator has been ordered from the General Electric Company by the Mead Company, and it is hoped that installation of same will have been completed by the latter part of the month of May. When installed and in operation the power output of the Chillicothe plant will have been more than doubled and it is hoped that shut-downs due to overloading of the present equipment will be done away with. The present electrical power equipment of the Mead plant at Chillicothe is one 2,500 kilowatt turbo-generator and one 900 kilowatt turbo-generator, both of General Electric make.

* * *

The installation of the new hot-process water-softening system in the plant will be completed and in operation sometime within the next few weeks. It is estimated that with the new system in operation it will be possible to soften approximately 16,000 gallons of water each 24 hours, which is from 6 to 8 times more rapid than was the old system employed.

* * *

In order to keep up with the demand for increased production in the plant necessitated by the large amount of new business recently acquired, numerous changes and additions to equipment have been made in the Chillicothe plant. It is the earnest desire of every one of the 550 employees of the Chillicothe mill to make the year 1924 a record breaking one, both as to production and quality. The thing requested of every employee by President G. H. Mead, at his annual dinner on January 13th, was "increased production throughout the year, with the thought of better quality coming first." All improvements and changes made have been made with this latter desire in mind.

* * *

The efficiency of the power department has recently been greatly increased by the addition of a new 180 foot steel smoke stack. The plant now has two 180 foot stacks, one of concrete 108 inches in diameter, inside; the other of steel, 96 inches of diameter, inside measurement.

* * *

An order was recently placed with the American Tool Works, by the Mead Company, for one new thirty-six inch by twenty-four foot engine lathe. The addition of this lathe to the already complete equipment of the Mead Company's machine shop will be a very valuable addition, making it possible to more easily machine large rolls from the paper machine and super-calenders. Delivery of the new lathe is looked for within the next few months.

* * *

A reduction of accidents during the year 1923 over similar figures for the year 1922 was shown in the plant. In 1922 there were a total of 50 lost-time accidents in the plant while in 1923 there were a total of only 46 lost-time accidents. Unfortunately, however, these 46 accidents resulted in the loss of more time than did the 50 accidents of 1922. One accident resulted in death during the year 1923, as was also the case during 1922. According to the method employed by the National Safety Council in which frequency and severity rates of lost-time accidents are computed, the severity rate of the Mead plant in 1922 was 5.13 days lost per 1,000 hours worked, while in 1923 this was increased to 6.58 days lost per 1,000 hours worked in the plant. The frequency rate in 1922 (number of accidents per 1,000,000 hours worked) was 39.4 accidents (while in 1923 this figure was reduced to 38.18 accidents per each 1,000,000 hours worked.

* * *

During the year, reports show that the first aid nurse in charge of the plant hospital handled a total of 3,087 cases. Included in this total were 493 minor accidents, 46 major accidents, 1,594 medical cases, 283 examinations, 396 redressings, and 275 visits to the homes of employees. This total is larger by 191 cases than was the total for 1922, and larger by 172 cases than was the total for 1921. Nevertheless the Mead Company feels that progress is being made in its Safety First campaign and in its campaign to get employees to report to the First Aid department for all minor or major cases of sickness, injury, etc.

* * *

The Mead Athletic Association reported a surplus in its treasury of approximately $700 at the close of the year 1923. It is the desire of the Association that enough more money can be raised from baseball games and other gatherings of a similar nature during the year 1924 so that with the beginning of 1925 serious thought can be given to the matter of constructing a concrete swimming pool in the Association's park, provided by the company and located only a short distance from the plant. Professionals who have seen and played on the Association's baseball diamond pronounce it one of the best and fastest amateur fields anywhere in the middle-west.

* * *

A question box has recently been started in "Mead Co-operation," the 48 page plant paper. Under the plan, various questions pertaining to operations in different departments, are asked each month in the publication, and a cash prize is offered for the best and nearest correct answer received from any employee to any of the questions. Employees themselves are also requested to submit questions for publication and for which cash prizes will be paid for the best answers. In this manner it is hoped to arouse increased interest among the employees in their work, thus tending to make them more efficient workers. To date the plan has worked to the entire satisfaction of the management and interest in it is increasing among the employees. The Mead Company also solicits and encourages its employees to turn in new ideas and suggestions pertaining to improvements in machinery or processes, safety first, reduction in costs, etc., for which liberal cash awards are made in the case of all suggestions which can be accepted and used. In addition to the individual cash awards for these suggestions, a grand prize of $50 is given at the close of each year for the best suggestion turned in during the year. During the month of January, 1924, a total of more than seventy suggestions were turned in to the Suggestion Committee, out of which number approximately one-fifth were acceptable and worthy of a reward.

A series of articles, entitled "Getting Next to Fakers," has recently been started in the plant publication of the Mead Company, and will continue throughout the year 1924. This series of articles was originally written by Mr. H. J. Kenner, secretary-manager of the Better Business Bureau of New York City, and appeared daily in the *New York Evening Journal*. Each of the articles is short and exceptionally well written, and each attempts to explain in a very brief way some one of the many methods often times employed by promotors and crooked stock salesmen to extract money from a gullible public.

* * *

That the year 1924 should be one of the biggest years, insofar as production goes, was the oustanding thought made clear by President G. H. Mead at the President's annual dinner, held in the Elks' Hall, Chillicothe, Ohio, on the evening of January 13th, for officials, executives, superintendents, foremen, sub-foremen, machine tenders, office workers, members of the Mill Council, members of the Mead Athletic Association, invited guests and their ladies.

* * *

An excellent four-course dinner was served to the assembled guests of President Mead at 6:30, after which Mr. Mead assumed the duty of toastmaster of the evening and introduced the various speakers who reviewed the past year's accomplishments and predicted great things for the year 1924.

* * *

Interspersed between the various talks, Mr. Mead, in his masterly manner, gave his own ideas and opinions regarding the future of business in general for the next year or two, and particularly his views as regards the future prospects for the Mead Company.

* * *

He stated that due to the co-operation manifested on the part of all Mead employees during the past year, the year had proven to be a very successful one from the standpoint of production, quality, and full-time operation throughout the year. He also quieted any feelings of uneasiness which might have existed in the minds of any as regarded the prospects for 1924. He stated that due to this spirit of co-operation and the excellent record made during 1923, it was possible for him to announce that there need be no fears on the part of any that there might be a possibility of slackened business during 1924. On the other hand, he stated, it will be necessary for the Chillicothe mills to turn out more and better paper during 1924 than ever before in the history of the plant, if promises already made are to be lived up to.

Mr. Mead also announced that due to the improved financial standing of the company, made during 1923, it had been possible for the directors of the company to announce the fact that dividends on common stock would be increased from four to six per cent. He voiced his hope that within the next year or two it would become possible to still further increase this figure, which, he stated, would necessarily mean a wage increase for all employees making such a thing possible.

* * *

Other speakers of the evening at the annual dinner were: General Manager, H. P. Carruth; Honorary D. M. Massie, president of the First National of Chillicothe; William H. Herrnstein, Secretary of the Chillicothe Chamber of Commerce; Frank C. Schachtele, Superintendent of the pulp mill of the Mead plant; Mr. Thomas Hendry of the Mead Patton & Company of New York City; Mr. Lawrence Bonner, Elected Representative of the Mead Mills Council; Mr. William H. Kettra, Assistant Treasurer of the Mead Company and Purchasing Agent of the Chillicothe plant; and Reverend Kelley Jenness, pastor of the Walnut Street M. E. Church of Chillicothe, Ohio.

* * *

Offer Stock to Public

The Columbia River Paper Mills are offering $500,000 worth of stock in the company at $100 a share to the public.

Ernest Schweitz, the engineer in charge of the work of installing the machinery in this company's large new mill at Vancouver, Washington, says that he will start the work by March 1, and that before May 1 the mill will be in operation. Most of the papermaking machinery has already been delivered.

The 100 feet addition to be built on the east side of the main paper mill will not delay installing the paper machinery as that will be placed in the building now being completed. Buildings in the way of the 100 foot addition are being wrecked now, and this additional room will be built soon.

* * *

Thinking of Forests

A special committee, headed by Hugo Winkenwerder, dean of the University of Washington College of Forestry, is working out a plan for the re-forestation of Seattle's Cedar River watershed. W. C. Weigle, supervisor of the Snoqualmie national forest, Frank Kellogg, state forest examiner, and Charles W. Sounders, chairman of the forestry committee of the house during the last session of the Washington state legislature are associated with Mr. Winkenwerder on this committee.

Re-forestation work is engaging the attention of the Pacific coast states lumber interests as well as the cities which desire to preserve the sources of their pure water supplies.

* * *

Cameron Good Advertisers

We have received from the Cameron Machine Company, an illustrated piece of direct mail matter with which they are circularizing the trade. This we understand is the first of a series which will continue over a number of months with the object of giving every potential user information concerning what the proper Cameron Slitting and Roll-Winding Machine will accomplish for him. Cameron Machine Company wants every one connected with the paper industry to receive these circulars as they are issued. If yours has not yet arrived, drop them a line at 61 Poplar Street, and you will receive the complete series.

EXPLAIN JUST WHAT THE McNARY BILL IS

Summation of Pending Bill is Given for Paper Industry

MUCH interest is manifested in this section in the McNary bill which is now before congress and which is the result of the investigations into the forest needs of the country made last summer and fall by a special committee of the United States Senate, one of the meetings of which was held in Bangor.

The bill aims to provide for much greater cooperation in forestry matters between the federal and state governments than has been possible under previous laws and to extend the enabling act under which the eastern national forests are being purchased, and also federal cooperation in fire protection, the previous law limiting this to land necessary for regulation of the flow of navigable streams.

A brief summary of the bill which has been reported out of the special committee and referred to the Senate committee on Agriculture and Forestry, follows:

Summary

Section 1: provides for cooperation with the various states in determining proper methods of forest fire protection and prevention.

Section 2: provides for cooperation with the various states in actual protection of timbered and forest producing lands from fire to an amount not exceeding the amount spent by the states themselves; and that this cooperation be "extended to any timbered or forest producing lands within the cooperating states."

Section 3: provides for federal "study of the effects of tax laws, methods, and practices upon forest perpetuation; to cooperate —with—states in such investigations, in devising tax laws to encourage growing of timber; and to promote practical methods of insuring standing timber on growing forests from losses by fire and other cause"; appropriates $2,500,000 annually for Sections 1, 2 and 3.

Section 4: provides for cooperation with states in forest seed and plant production and distribution, to a cost not to exceed the amount expended by the states themselves, and appropriates $100,000 annually.

Section 5: provides for cooperation with states in advise to timberland owners, to a cost not exceeding the amount expended by the states themselves, and appropriates $100,000 annually.

Section 6: extends the provisions of the act of March 1, 1911, under which the eastern national forests are being purchased, to allow of the purchase of "such forested, cut on, or demanded lands" as in the judgment of the Secretary of Agriculture may be necessary for either the regulation of stream flow "or for the production of timber"; (the original bill limiting purchases to land necessary for the regulation of flow of navigable streams).

Section 7: provides for accepting by the U. S. Government of forest land donated to it, to become part of national forests.

Section 8: provides for inclusion in national forests of public lands which may be valuable for either stream flow regulation or timber production.

Section 9: provides for inclusion in national forests of land now in other government reservations (except national parks, national monuments, and Indian reservations) as are suitable for production of timber.

New York Trade Notes

A. J. Pagel, of Pagel, Horton & Company, Inc., was elected president of the Association of American Wood Pulp Importers at the annual meeting and election of that organization at the Uptown Club on West Forty-second Street on February 7. Other officers chosen include J. F. Patton, of J. F. Patton & Company, vice president; Orval A. Wales, of Johaneson, Wales & Sparre, Inc., secretary, and Orvar Hylin, of the Lagerloef Trading Company, Inc., treasurer. These officers, together with William H. Anders, of the Perkins-Goodwin Company, comprise the Board of Directors of the association. H. E. Atterbury, of Atterbury Bros., Inc., was elected National Councillor, and J. A. Millar, of the Scandinavian Pulp Agency, Inc., was selected as substitute National Councillor. The association numbers among its membership practically every importer of wood pulp in New York, and has been in existence for quite a few years. Mr. Pagel, the new president, is widely and favorably known among paper manufacturers and pulp men, being one of the prominent members of the wood pulp trade.

* * *

Daniel M. Hicks, Inc., dealers in and importers of papermaking supplies of 200 Fifth Avenue, New York, have announced that Fred H. Chase, formerly of Chase & Norton, Inc., waste paper packers of 275 Water Street, New York, which firm has wound up its affairs, is now associated with them in a buying and selling capacity in their waste paper department. Mr. Chase is one of oldest and best known members of the paper stock trade in New York, having been identified with the industry for more than a quarter of a century. In his new connection with the Hicks firm he will retain the New York City packing house formerly conducted by Chase & Norton, Inc., which will enable Daniel M. Hicks, Inc., to supply larger amounts of their high grade packing of waste paper to consuming mills.

* * *

The Select Paper Company, of New York City, was incorporated under New York State laws at Albany, N. Y., several days ago with a capital of $10,000 to deal in paper as merchants. The incorporators were O. Salk, I. Gershman and I. E. Schlesinger, and the attorney was H. J. Krinsky, of 299 Broadway, New York.

* * *

Cards have been issued announcing the formation of the Hartig Pulp Company, Inc., with offices at 248 Park Avenue, New York, which has been organized as a branch of Hugo Hartig, Inc., of Stockholm, Sweden, and Hugo Hartig, of Hamburg, Germany, to represent in the United States a part of the agencies intrusted to the parent companies abroad. Hugo Hartig is president of the New York firm, Marvin Preston is vice president, and Kenyon Harris is secretary. Mr. Harris heretofore has been with the American Woodpulp Corporation, of New York. The new company will import wood pulp of all kinds.

* * *

John H. Engelke has severed his connection with Salomon Bros. & Company, importers of papermaking materials of 200 Fifth Avenue, and is now associated with the Whaling Waste Products Company, Inc., of 290 Broadway, New York, for whom he will open a foreign papermaking rag department.

FORESTRY in the PAPER INDUSTRY

Conducted by J. R. Simmons, Secretary Forester, the New York State Forestry Association

Papermen Speak at Washington

"Grow More Trees" Is Slogan of Busy Meeting in Washington with Prominent Paper Men Present

GROW MORE TREES" for the paper industry of the United States was the policy enunciated by the Advisory Committee from the Paper Industry before the Department of Agriculture, in the first meeting of that committee in Washington, February 7, when some of the best known paper manufacturers of the country discussed forestry and forest products with Secretary Wallace, and other officials of the department, including representatives of the Forest Service.

The need for the perpetuation of the nation's forests, the importance of reforestation, forest management, the work of the department's laboratories and experiment stations were the focal points upon which the discussions of the day were centered.

The conference with the Secretary of Agriculture, a meeting with the President, and a luncheon with Secretary Hoover of the Department of Commerce as the guest were other special features of the all-day meeting. It was a representative gathering of manufacturers, the membership of the committee including: George W. Sisson, Jr., Racquette River Paper Company, Potsdam, N. Y.; Col. W. E. Haskell, International Paper Company, New York; Stanley C. Bayless, Bayless Mfg. Corp., Austin, Pa.; L. M. Alexander, Nekoosa-Edwards Paper Company, Port Edwards, Wis.; D. C. Everest, Marathon Paper Mills Company, Rothschild, Wis.; C. A. Gordon, Oxford Paper Company, New York; Norman W. Wilson, Hammermill Paper Company, Erie, Pa.; George N. Ostrander, Finch, Pruyn & Co., Glens Falls, N. Y.; H. E. Fletcher, Fletcher Paper Company, Alpena, Mich.; F. R. Bragg, Orono Pulp & Paper Co., Orono, Me.; F. C. Clark, Pejepscot Paper Co., Brunswick, Me.; Charles W. Luke, West Virginia Pulp & Paper Co., New York; A. C. Goodyear, Bogalusa Paper Co., Bogalusa, La.; Louis Bloch, Crown Willamette Paper Co., San Francisco, Cal.; Grelett Collins, Dill & Collins, Philadelphia, Pa.; O. Bache-Wiig, Wausau Sulphate Fiber Company, Mosiness, Wis.; Henry W. Stokes, York Haven Paper Co., Philadelphia, president American Paper & Pulp Association; Milton E. Marcuse, Bedford Pulp & Paper Co., Richmond, Va.; Charles Upson, Upson Co., Lockport, N. Y.; Dr. Hugh P. Baker, executive secretary American Paper and Pulp Association.

Secretary Henry C. Wallace, of the Department of Agriculture, opened the day's program with the discussion of "The Paper Industry and Forest Policy," and was followed by George W. Sisson, Jr., former president of the American Paper and Pulp Association on the subject "Co-operation Between the Industry and the Department of Agriculture." Norman W. Wilson followed with an outline of "Future Developments of the Paper Industry," and the balance of the forenoon was devoted to discussions of work being done by the Forest Service. Samuel T. Dana told of the work of the Northeastern Forest Experiment Station, which will devote much of its attention to forestry problems in their relation to the pulpwood supply of the country. Raphael Zon told of the work of the Lake States experiment station, and Carlile P. Winslow, director of the Forest Products Laboratory at Madison, Wis., discussed technical work of the laboratory in the study of the paper making properties of various woods, and similar problems undertaken by the laboratory. Charles W. Boyce in charge of pulp and paper statistics of the Forest Service took for his subject "Economics of Pulp and Paper."

After the luncheon, the program was devoted to discussion of the various points brought out by the Forest Service speakers, Mr. Ostrander and Mr. Everest speaking on the two experiment stations as paper manufacturers in the districts covered by these stations. W. G. McNaughton commented for the Technical Association on the work of the laboratory, while Dr. Baker discussed the paper of Mr. Boyce.

Mr. Dana pointed out that more than half the pulp mills of the country are located in the New England-New York district, and said the problem there was to build up the forests to the point where they would be capable of supplying indefinitely the raw material needed by the paper industry. Investigations to this end, he said, will be an important function of the station's program.

Mr. Zon specified as the five year program of the lake states station various studies of rate of growth, more effective fire prevention, forest management to improve the growth of timber and similar problems.

Co-operation of the mills with the laboratory was urged by Mr. Winslow, and the reduction of waste caused by pulpwood decay was given as a particular problem. The suggested use of southern pine for sulphite pulp was mentioned as a particularly important problem for study in the next five years.

Mr. Boyce urged more detailed studies of existing stands of pulpwood forests, cost of growing timber, forest taxation and similar problems.

In discussing Mr. Boyce's recommendations, Dr. Baker pointed out that the development of plans for the future of the paper industry are dependent upon accurate knowledge of available timber resources, and said:

"Forestry is the foundation upon which the industry is to build for the future, and must be co-ordinated closely with the development of the agricultural industry. Forestry and agriculture must be developed together in the wood producing sections of the country. The great areas on the border line between agriculture and forestry can only be satisfactorily developed as co-ordinated industries, where the farmer can earn money with which to develop his farm on agricultural soil by working in the winter in the timber producing regions adjacent thereto whose soil is not such as to be suited for the growing of farm crops."

In his talk on "The Future of the Paper Industry," Norman W. Wilson, Hammermill Paper Company, said:

In 1899 this country produced approximately 2,100,000 tons of paper while in 1923 we produced 7,200,000 tons. The increase was quite uniform from year to year until 1920—since then we are just about holding even.

You are familiar with the classification—News, Book, Board, Wrapping, Fine, Tissue, Hanging, Felts and Building Specialties.

Production of each has grown not only consistent with the increase of population but also consistent with the advance of civilization and the standard of living so that the total production of paper per capita is now nearly three times as great as that of 1899.

This increase has brought us from a relative minor position to a point where we are now the leading manufacturers of pulp and paper throughout the world.

To advertise business grandpa hung out a shingle, and reached everyone's attention who happened by—grandson gets printed letterheads, and advertises in newspapers and magazines. He doesn't stop at our shores but uses these implements in foreign publications, where necessary in a foreign language and reaches the entire civilized world.

The future of the paper industry in this country depends upon our ability to compete with other nations for our own markets and for foreign markets and we believe our ability to compete depends upon our ability to acquire or produce our principal raw materials.

While the manufacture of paper involves the consumption of large quantities of coal, dyestuffs, sulphur, alum, chlorine, rosin, clay, glue, lime, etc., the raw material which is the big problem is the fibre from which the sheet is formed.

This fibre is now obtained from linen and cotton rags, from trees and other plant life.

The production of rags and their ultimate use in paper has increased to some extent. There has been some progress made in the commercial development of grasses, shrubs, etc.

However, from a standpoint of cost and of efficiency the Industry has come to depend more and more upon pulp produced from the tree until it is now estimated that 90 per cent of the fibre used is from the tree.

In the first place cheaper wood, second cheaper labor; and third, depreciated currencies.

The combination permits them to sell at prices almost unbelievably low.

This was forseen by our Pulp and Paper producers, when the Fordney-McCumber

Tariff Bill was being shaped and reasonable protection was sought in that tariff. Shortly before the Bill was passed, we understood that we were assured of protection on both pulp and paper but at the last moment all protection for pulp was withdrawn.

Eventually this Continent, both Canada and the United States, may be forced to apply tariff protection against European pulp as it has done against European papers and so many other products.

Their big advantage, therefore, is cheaper wood. On this Continent we have been consuming our forests more rapidly than they have been reproducing. The fact that our forests have been pushed further and further back from our railroads, rivers and lakes, has, of course, increased the cost of production and transportation. Finally, the increased ratio of demand to diminishing supply, has of late years put a premium upon the cost of this necessary raw material.

More progress must be made if the Paper Industry is to be perpetuated on this Continent. Our principal competitors abroad are further advanced with this project. Norway, Sweden, Finland and Germany have all seen the value of their forests and have adopted methods of protection and of replenishment that have permitted them to increase their output of pulp and paper without diminishing their available supply of pulpwood. So long as the supply on this Continent continues to decrease the cost of wood will increase and eventually make it entirely impossible for us to compete no matter how efficient we may be in our mills or in our methods of merchandising.

It is felt by the broader minded U. S. manufacturers that Canada will surely not apply an embargo or restrictive export duty but we refer to the matter at some length for the purpose of emphasizing the need of preserving our depleted forests and of growing new ones.

Just a word with respect to the marketing of paper. A study of the price trend must convince us of the need to produce at lower cost. While untimely reductions in price are ruinous to any Industry, nevertheless it is axiomatic that a low cost of production with an accompanying low price to the consumer, has a decided tendency to expand the amount consumed. In proportion to the cost of production, paper of all descriptions is being sold at such close prices that very little money is being made at the present time. To protect ourselves and to get back onto a reasonable earning basis, we must reduce our costs and to help expand the market we must prevent our prices from getting out of line with the cost of other commodities.

Cheaper wood and rags are of prime importance.

A higher yield of pulp from each cord of wood must be accomplished.

We must find commercial usage of the bark which constitutes 12 per cent of the pulpwood now consumed.

We must develop extensive by-products from the waste liquor; for instance sulphite waste liquor contains more than 50 per cent of the weight of each cord of wood now used.

More technical men of a high type must be available than we now have.

More support should be lent to existing research of organizations and new research work in pulp and papermaking problems should be encouraged in Universities and in industrial laboratories.

Men of inventive genius should be brought into the Industry to speed up what is now being accomplished toward labor saving devices.

We realize that the Department of Agriculture has our problems well in hand. We have tried to be thorough with respect to those problems upon which we know you can help us and have touched upon just a few upon which you can help us perhaps only indirectly.

"The Economics of Pulp and Paper" was the subject of a discussion of Paper by Charles W. Boyce, in charge of Pulp and Paper Statistics, United States Forest Service, led by Hugh P. Baker, Secretary of America Paper and Pulp Association.

Dr. Baker said:

In 1923 it is estimated that we used just a little over 6,000,000 cords of wood, valued at something over $90,000,000. During the year we imported, entirely from Canada, 1,400,000 cords of wood. For the same year it is estimated that we used 5,019,000 tons of wood pulp, though we produced but 3,613,660 tons, importing the remaining amount consumed. This use of pulpwood and pulp resulted in an estimated production of 7,198,000 tons of paper of all grades. It is safe to estimate that of the 7,000,000 tons of paper produced in the United States in 1923 that more than 95 per cent was made wholly or in part from wood pulp.

The paper industry has become indeed a wood using industry, more and more dependent upon a steady supply of wood from the forests of this country. While the paper industry uses but 4%, approximately, of the total annual wood cut out of the country, yet it must have this wood moving to the mills in a steady stream through the year.

In the necessary economic survey, upon which we must depend for accurate information as to available timber, there should be thorough study made of the cost of producing timber under varying forest conditions in the United States. In this same connection, a knowledge of costs of producing wood and pulp abroad would be exceedingly helpful.

The fact that the paper industry is a wood using industry is of such recent acceptance in the industry itself, generally speaking, that the average paper manufacturer has not yet come to think of himself as a timber owner and as a lumberman to the extent to which he harvests and uses timber.

The most natural procedure in the development of forest lands on the part of pulp and paper manufacturing organizations will be the production, first, of wood of character and size of greatest value to the paper industry, next, a certain amount of timber will be allowed to grow on into sizes larger than needed for pulpwood. It may be that in the development of forest lands by paper mills that the paper mill may find it can easily produce wood for lumber, in connection with wood for pulp, and that in a profitable way.

It is entirely possible that paper mills located in the neighborhood of other plants using wood for the manufacture of furniture or for other purposes may come to depend upon these plants for a certain amount of wood, which may now be wasted. Little effort has been made so far in this country to coordinate the activities of various wood using industries to the point where the waste of one plant may be raw material for another. There are large possibilities in this direction.

As has been pointed out in this paper (upon the economics of pulp and paper) accurate and complete statistics covering the forest resources of the country, the production and use of wood and pulp, and the production of paper, and fundamental to the satisfactory continuance of the industry. The industry was forced last year to take over certain phases of statistical work carried on previously by the government. Some of this statistical work can be carried on more effectively by associations within the industry than in any other way. We need, however, more accurate statistics as to wood production generally, and we urge that the Forest Service be given the facilities to carry forward the statistical work which they have already under way.

Great help could be given the industry by making careful studies in two or three representative states of available timber supply and of forest soils and their relation to the wood-using industries. Such a study should be both an economic and social study, and should be applied not on a theoretical basis but on the practical foundation of the operation of industry within those states.

It is exceedingly important that the paper industry should have accurate information as to the pulp and paper industry in foreign countries, including Canada. Such information should indicate the relation of the depletion of forests in those countries to the development of industry and how the introduction of modern methods of forest practice have benefited industry. Furthermore, the paper industry of this country should have constant and accurate statistics as to production, marketing, and use of pulp and paper in foreign countries.

George W. Sisson, Jr., of the Rocquette River Paper Company, said in brief:

The greatest cooperative effort of the paper industry with the Department of Agriculture should be along forestry lines. The absolute dependence of the industry in the United States upon wood fibres, their rapid depletion in this country and the probable increasing difficulty of securing outside supplies makes this the major problem of the industry today.

As owners of timberland, paper manufacturers are ready to cooperate with the forest service in such research and experimentation as will lead to definite knowledge of the best methods in the various localities to reach the desired result of adequate protection, economic management and assured reproduction. In other words, we are ready to make our forest lands working laboratories in connection with the broad campaign of the United States Forest Service.

The *second* great field for cooperative effort is in the line of utilization of our raw material, and this brings us directly to the splendid contribution to our industry that is being made by the Forest Products Laboratory. You will doubtless hear of the many projects which Director Winslow has in mind. None of these projects can be translated to the practical benefit of the industry without the sympathetic and intelligent cooperation of the mills. It is not likely that the full import of the wonderful results of the research work at the Laboratory is realized by the industry. Any one of the several important problems for which they have found solution in recent years would more than warrant all that its support has cost. Recognition by the industry is due to these men of research whose painstaking work finds ultimate usefulness to the people only when adopted and put into practical commercial use in the arts and industries. First, a sympathetic and helpful attitude toward its work and every possible assistance in securing adequate financial support for it. Second, a readiness to apply in our mills the results of laboratory research and demonstrate their commercial possibilities. Third, to make our mills, so to speak, *extension laboratories* in which under the guidance of the laboratory, we can assist in carrying on investigations, which being made under commercial conditions may have added value.

McBAIN'S PAGE

A FEW PUNGENT POINTS ON PERTINENT TOPICS

If You Could Only Help

THERE is an old saying that "Since the beginning of time, men have looked to Leaders." If you could only help as a Leader and the Laws would only allow, and I think the Laws should be such that it had to be, and if you would provide the Industries of the Country in every line with Leaders who would say what you and I should make the minimum price of our product and if we did not comply with these instructions, we would be defying the Law, under penalty.

If it is not the acceptable thing to have a Leader or a Dictator of this type, it would seem even more desirable than for the baseball industry or for the picture business to be under such rule, that some of our industries now dying from dry rot or from starvation, be forced to make a product they can make economically and then given a minimum price at which this product can be sold.

It would be better for the industry's stockholders and for the labor interested; it would be better for the market, for the jobber and final consumer, because a mill would then be standardized for certain grades and not be cutting in on a legitimate plant with an offer of "something just as good" for less money.

No consumer wants something just as good. He wants what he wants—usually asks for what he wants and knows when he gets what he wants.

The mill built for making one grade is not so likely to be able to produce a match for the product of another mill built for making another particular grade, and is not so likely to be able to produce that grade in as economical a way, yet when he cuts in and offers a cut price, he very seldom gets the business but forces the legitimate mill to cut his price to retain what is rightfully his.

A clearing house for any industry would be a good thing, and probably it would be better if the laws of our country would be changed so all business for one industry could go through one central clearing house.

In any event, something is needed and something must be done soon to regulate industry, like the Interstate Commerce Commission governs the building of new railroads, and not allow new plants to be built when the production in any line already exceeds the demand, for the investor should be protected as well as the worker and the consumer while at present there is no protection for anyone.

However, law is law. If you could only help?

B. T. McBAIN.

Whose Market?

Is this my market because my mill is the closest to it?

Is this my market because the freight rate I enjoy gives me the inside on price?

Is this my market because I can deliver my product to it at a cost less than any other producer?

Is this my market because I produce something I think the people should want?

Is this my market because I think my product better than anything else being offered?

Is this my market?

Let me answer what I think:

This is my market only when I produce something the market wants and deliver it to the consumer at a price he can afford to pay.

The consumer knows what he wants and knows when he gets what he wants.

The consumer knows what he can afford to pay for what he wants and if he can get what he wants from my competitor at the price he knows he can afford to pay, it is my competitor's market.

That is the way of the world. That is the way of America. That is the way of each separate State of the U. S. A. and it has been my experience that that is the way of each separate consumer of the products I help produce and market.

There are too many people harping about "my market" and expecting to get the business because of geographical conditions while quality and price are the all controlling factors and always will be.

If I cannot produce the goods wanted, it is not my market. If I cannot name the price others, with the desired goods can name, it is not my market.

And no Salesman's Association or Manufacturers' Association or any other kind of an Association can do anything legitimate or otherwise to make it my market, even if I should have an idea that such a thing were possible, or such Associations were willing to do business in that manner.

The laws of America are such that I must work alone, selfish, to be sure; but I must not forget that all my competitors are in like boats and working under like laws.

If it must be the survival of the fittest, lets fit and go to it. Then and then alone, will it be my market.

B. T. McBAIN.

A. Krug

Cameron Machine Company,
Brooklyn, N. Y.

Says:

GENTLEMEN:

Permit us to add our voice to the chorus of praise which you are doubtless hearing on the improved make-up of your magazine. You have started off very auspiciously, and we wish you every success.

Yours very truly,
Cameron Machine Company
A. Krug.

CONSTRUCTION NEWS

A Summary of Vital Facts Regarding Construction, Finances and Operation of Paper Mills

Kingsport, Tenn.—The Mead Fibre Co., has tentative plans under advisement for enlargements in its plants, to include the installation of a new papermaking machine, providing for an increase of about 30 tons capacity per day. It is also proposed to advance the output in the pulp plant, and additional equipment will be installed.

Philadelphia, Pa.—The plans for the proposed addition to the plant of George A. Bisler, Jr., 245 North Sixth Street, manufacturer of paper boxes and containers, are practically completed, and erection will be commenced at an early date, to be in charge of the William Steele & Sons Co., 219 North Broad Street, engineer and contractor. It will be four-story, reinforced-concrete, located on North Fifth and Brown Streets.

Quebec, Que.—Price Brothers have plans under way for the construction of a new pulp mill in the vicinity of Lake St. John, and plan to call for bids at an early date. The new plant is reported to cost in excess of $300,000, with machinery.

Marinette, Wis.—The Victory Bag & Paper Co., has plans in progress for the construction of a new addition, to be used for warehouse and distributing service. It will approximate 7,000 sq. ft. of floor area.

Salem, Ore.—The Oregon Pulp & Paper Co., has awarded a general contract to A. C. Van Patton & Son, Salem, for the erection of a new two-story addition, 40x70 ft., estimated to cost $25,000. Electric power equipment will be installed. Knighton & Howell, United States National Bank Building, are architects.

Little Falls, Minn.—The Itasca Paper Co., Grand Rapids, Minn., has acquired a local site and has preliminary plans under way for the construction of a new mill, to consist of a number of units with power house, machine shop and other auxiliary structures, with reported cost estimated at $400,000, including equipment. It is proposed to commence work in the near future.

Dayton, Ohio—The Elam Paper Co., Marion, Ind., manufacturer of stationery, etc., has taken over the former local plant of the Bahmann Iron Works, and will remodel and equip for a new mill. Machinery will be installed at an early date. At a later date, it is expected to build an addition. The Marion works will be removed to Dayton.

New York, N. Y.—Charles Sonn & Brothers, 202 East Twenty-ninth Street, manufacturers of paper boxes and containers, have leased the second floor in the building at 322-26 East Twenty-third Street, for extensions in their works.

Cambridge, Mass.—The plant and business of the Northeastern Paper Co., East Cambridge, have been acquired by the D. De Stefano Co., Inc., 83 Damrell Street, Boston, Mass., dealer in paper stocks. The new owner proposes to operate the East Cambridge works and expects to develop maximum capacity.

Rumford, Me.—The Continental Paper & Bag Mills Corporation has been organized under Delaware laws to take over and expand the company of the same name with headquarters at 16 East Fortieth Street, New York. The company will assume control of the Rumford mill, as well as other plants at an early date, and proposes to develop to maximum output. To provide for the transfer, a bond issue of $6,000,000, is being sold, a portion of the proceeds to be used for general expansion. The new company will be affiliated with the International Paper Co., New York. Herman Elsas is president.

Montreal, Que.—The St. Regis Paper Co., Watertown, N. Y., has plans in progress for the erection of its proposed mill on site acquired near Montreal. It is expected to ask for bids early in the sping. It is estimated to cost close to $1,000-000, including equipment. A. P. McKinnon, 11 Place D'Armes Square, Montreal, local representative for the St. Regis company, will be actively identified with the new project.

Eau Claire, Wis.—The Dells Paper Co., is perfecting plans for the early installation of equipment at its local plant, used for the production of machine glazed and finished wrapping papers. It is proposed to have the expansion completed by the spring, including new buildings which have been in course of erection for some months past.

Chillicothe, Ohio—The Mead Paper Co., has preliminary plans under way for the erection of a new addition to its plant, and proposes to break ground early in the spring. Considerable additional equipment will be installed. George H. Mead heads the company.

New Companies

New York, N. Y.—The Tioga Paper Goods Co., has been incorporated with a capital of $60,000, to manufacture and deal in paper products. The incorporators are S. Stutz, S. Friedman and S. Siegel. The company is represented by Myron Krieger, 220 Broadway, New York.

Chicago, Ill.—The Paramount Protected Paper Co., Room 1650, 10 South La Salle Street, has been incorporated with a nominal capital, not stated, to manufacture and deal in paper products. The incorporators are A. C. Jung, Harry D. Harkness and L. Dahllof.

New York, N. Y.—The Hartig Pulp Co., has been incorporated with a capital of $100,000, to manufacture pulp and paper products. The incorporators are F. J. Welsh, E. J. Mullaney and W. J. Bloom. The company is represented by Tanzer & Lane, 261 Broadway, New York.

San Antonio, Tex.—The Crown Paper Box & Label Co., has been incorporated with a nominal capital of $9,000, to manufacture paper boxes and containers, etc. The incorporators are Leo Singer and M. J. Arnold, all of San Antonio.

Waterford, N. Y.—The Waterford Art Papers, Inc., has been incorporated with a capital of $10,000, to manufacture and deal in fine papers. The incorporators are R. F. Hammond and H. I. Prankard. The company is represented by T. O'Connor, attorney, Waterford.

New York, N. Y.—The Select Paper Co., has been incorporated with a capital of $10,000, to deal in paper products. The incorporators are I. Gershman and I. E. Schlesinger. The company is represented by H. J. Krinsky, 299 Broadway, New York.

Corning, N. Y.—The Corning Fibre Box Corporation has been incorporated with a capital of $125,000, to manufacture fiber and paper boxes and containers. The incorporators are J. L. Thomas, W. H. Curtis and C. Boehm. The company is represented by Stanchfield, Cotton, Lovell & Sayles, Elmira, N. Y., attorneys.

Pittsburgh, Pa.—The Pittsburgh Card Board Co., has been incorporated with a nominal capital and has made application for a state charter, to deal in cardboard, paper goods and affiliated products, as well as boxes, containers, etc. The company is headed by Stanley M. and Ivan Bielek. It is represented by James M. Wakefield, 314 Bakewell Building, Pittsburgh.

Financial

Lincoln, N. H.—The Parker-Young Co., operating a local paper mill, with pulp mill at Livermore Falls, N. H., is disposing of a bond issue of $2,500,000, a portion of the proceeds to be used for extensions.

New York, N. Y.—An involuntary petition in bankruptcy has been filed against the United States Paper Mfg. Croporation, 17 East Forty-second Street, and Charles A. Marshall has been appointed receiver under bond of $10,000.

Philadelphia, Pa.—Edward F. Hoffman has been appointed referee in bankruptcy for the Bridge Paper Co., 141 North Sixth Street, against which an involuntary petition in bankruptcy has been filed.

Paper Industry Provides Textbooks

ANNOUNCEMENT of the election of George Carruthers as president of the Canadian Pulp and Paper Association on Friday, January 25, followed shortly after the appearance of Volume IV of the series of textbooks on *The Manufacture of Pulp and Paper,* which have been in course of preparation, under the direction of a committee on vocational education, representing the pulp and paper industry of the United States and Canada, for five years past.

The honor that has come to Mr. Carruthers may be fortuitous, but it looks like a coincidence and should be regarded as recognition of merit. For no member of the joint committee which has been working so earnestly and so unselfishly since February, 1919, to put the paper industry on a firm educational basis, has given so unstintedly of his time and resources to the furtherance of a great undertaking than Mr. Carruthers.

The educational needs of the industry were impressed on Mr. Carruthers when he first made up his mind, in 1911, to identify himself with papermaking in Canada and organize the Interstate Tissue Mills, Ltd., of Toronto, which materialized two years afterwards with the construction of a plant at Merritton, Ontario. Some time previous to this he had charge of the field work of the International Correspondence Schools and the excellent training and the splendid results he got in this line of work fitted him admirably for an exhaustive study of the educational needs of the paper industry to which he subsequently gave his time and talents. His career in papermaking has been marked by a consistent devotion to the best interests of the industry such as has been exhibited by few of his confreres, all of whom will testify to his enthusiasm for educational work and the solid character of his accomplishments. Coupled with an extraordinary capacity for hard work and concentration on the problems before him, Mr. Carruthers possesses a faculty of relaxing in congenial society, and at banquets and social gatherings he is always a welcome guest when not the presiding spirit. He is able to tell a good story with zest and usually has a new one for the occasion. He is as well and favorably known among papermakers in the United States as in Canada, and among the younger men engaged in technical work, who are identified with the Technical Association of the Pulp and Paper Industry, he is a prime favorite, being seldom absent from the annual meetings.

This is a long preamble to a review of the latest issued volume of the vocational textbooks, but the opportunity to link Mr. Carruther's election to the presidency of the Canadian Pulp and Paper Association with the progress of educational work in the pulp and paper industry could not be resisted.

In studying Volume IV of the series of textbooks on *The Manufacture of Pulp and Paper* it is difficult to avoid comparisons with Volume III, extended criticisms of which were published in the issues of PAPER for April 26, May 3, and May 10, 1922, respectively.

The sectional divisions of the new volume are fewer than those in the volume that preceded it—six as against nine—and, with two or three exceptions, the matter is not so interestingly or so logically presented. In Volume IV papermaking operations are assumed to begin with the preparation of rags and rag fibers. Section 1, by E. C. Tucker, is accordingly given over to a consideration of the treatment of rags and rag fibers. An altogether too "Brief History of the Use of Rags in Papermaking" forms the first lesson. The traditional conservatism is perceived in the spelling of "paper making" as two words. It is many years since papermaking, shoemaking, and bookkeeping passed out of the evolutionary stages of two words and compound words joined by a hyphen. The rule in this volume is to hyphenate the word only when it is used in the adjectival sense.

Sixty pages are allotted to the section on "Preparation of Rags and Rag Fibers" and the treatment is rather cursory, though useful details are given of commercial practice and trade customs. The machinery used for the dusting (threshing) and cutting of rags is fully described and illustrated by figures in the text, as are also the boilers used in cooking and washing the rags. In the discussion of washing processes emphasis is placed on the need of clear, colorless water, but something might have been said regarding the sources of contaminating substances in water. In a modern book one expects some mention of the iron bacteria which have been recently found to be the cause of iron discolorations in finished papers. But some things have been sacrificed in this chapter to brevity, a few details of manipulations such as would be useful to students and beginners being lacking.

There is a chapter on "Fibers Other Than Rags," which includes mention of hemp, jute, cottonseed hulls, bagasse and esparto. By hemp is meant the so-called Manila hemp, which is in reality a variety of banana, the wild or inedible banana, known as *Musa textilis.* The true hemp, *Cannabis sativa,* is used only in the preparation of Bible, cigarette and certain other special papers. The chapter on jute is well presented and the treatment of the sacking, burlap and string which are the sources of the jute fiber used in the manufacture of high grade drawing papers as well as wrapping papers is adequately described with a good practical insight into manufacturing conditions. The same may be said of the chapter on Esparto, which was contributed by James Beveridge, a most competent writer and veteran papermaker, who is widely known in technical circles as the author of the *Papermakers' Pocketbook.*

There is an obvious typographical error at the outset of the chapter on esparto in attributing the introduction of the grass as a papermaking material to the "late Mr. Thos. Routtcop." The name should read *Thomas Routledge.* Esparto paper was first produced at Routledge's Eynsham mills in England in 1856. The new paper was used in printing an issue of the *Journal of the Society of Arts* in November of that year. Routledge was granted a patent on the use of esparto in 1861. The English papermakers were slow to appreciate the value of the grass as a source of paper fiber. Samples of esparto were shown at the first great International Exhibition organized in London in 1851, and it is stated that one patent was taken out ten years earlier.

American papermakers can not be induced to turn to esparto as a substitute for wood, any more than they can be interested in the new chlorine process of pulping and largely for the same reason, though other factors also prevail. For one thing it would necessitate a complete change of equipment in American pulp and paper mills, the types of digesters used for the cooking of esparto being different from any of the boilers used either for rags or wood. Another consideration is the cost of transportation from Algerian and other ports on the Mediterranean Sea, which is prohibitive for American manufacturers. The esparto fiber is one of the choicest fibers used in papermaking, having certain peculiarities of fibrillage which make it superior in some respects to linen. But of this Beveridge says nothing in the chapter of this volume which bears his name.

To a later issue will be left a detailed criticism of the other five sections of Volume IV. These include a good practical account of the treatment of waste papers for the production of various kinds of new paper and of board, and a valuable chapter on Beating and Refining which is marked by a scholarly and scientific handling of the theme that contrasts favorably with some of the other chapters. This chapter is enhanced in value by a good bibliography of beating and related topics that extends over seven pages. The chapter as a whole is a highly creditable contribution to our knowledge of the beating process, and one calculated to be of great service in pointing beginners and even practical papermakers toward a correct understanding of the functions of a beating engine and of the changes which are effected in the fiber as the beating proceeds.

The operations of loading, engine sizing and coloring are excellently treated in subsequent chapters and the volume closes with a most comprehensive section on "Papermaking Machines," which is divided into four parts treating respectively, of the paper machine and its equipment in general, the press part, the dryer part, and the calenders, slitters and winders.

This series of textbooks reflects the utmost credit on all who are concerned in its production. A word of praise is due even the printers and binders for furnishing so presentable a volume as to typography and one that is in form and manufacture so convenient and durable.

An Open Letter to the Paper Manufacturer

Dear Mr. Paper Manufacturer:

There is a story going the rounds about the Deacon's horse which although fed vast quantities of sawdust gradually weakened nigh unto death. He had not been getting the proper food.

The papermaker contends that the Printer is none other than the Deacon of the paper business but what is the poor horse going to do about it! He wants food—the Deacon gives him what he thinks he wants. If some horse food manufacturer could educate the horse to some higher grade of food, we'll bet the horse wouldn't eat the Deacon's fodder. (The cheapest in the line).

Just for a little "horse sense"! Isn't the general public;—the consuming public, we mean, just like the horse? It doesn't appear to us like the printer's job to sell the consumer paper. The printer will sell the public along the line he is organized for—printing! Once-in-a-while you'll meet up with a printer who has personality and brains and he begins to talk about kinds of paper; but right there his prospect is all at sea. He knows no more about using that paper than an inlander would a single oar in a dory in the ocean; and he ends by putting the job on the printer. That doesn't always mean satisfaction. Perhaps only one in four is ever satisfied with the finished job, but if they knew more about paper and what they would really like the completed job to be, they could be truly helpful to the printer. They would understand that certain papers "won't do" and why, and also why other papers should be used.

As we see it, it is the manufacturer-of-paper's job to sell paper to the consumer;—your job as well as of all other papermakers.

The clearly defined policy of the Exposition is to educate the consumer and create in him a desire and a demand for finer and better paper.

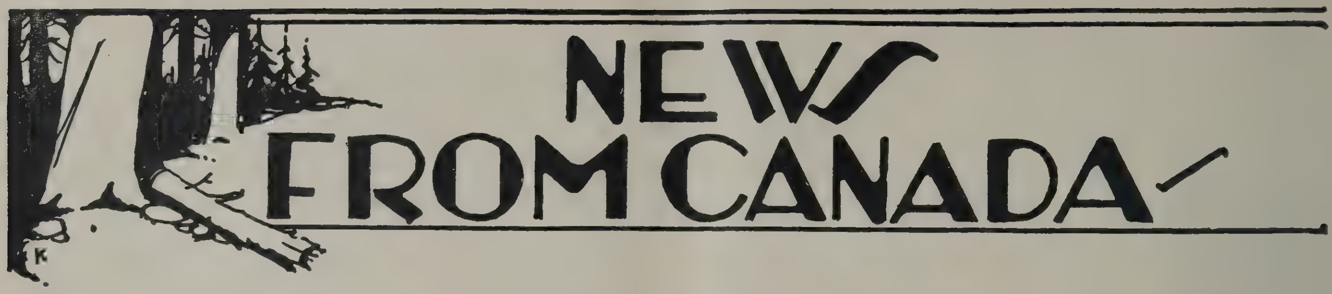
You have a pretty good idea as to what type of customers the meetings which will be held the same week as the Exposition will bring to an exhibit here, but do you realize the numbers of advertising men, direct mail men, printers, publishers, and—just consumers, shall we say, who attend the show? We are quite certain you don't! If you did there would be only one decision to make.

Watch some of the advertisements as they appear in the trade papers like "Printing," "Printer's Ink," "Postage," "American Printer," "American Paper Merchant," "Advertising & Selling," and you'll be convinced that there is a real selling opportunity for you. The Exposition company is advertising to these people because you and your fellow manufacturers have something to sell in the way of good papers. They are advertising in such papers as "Paper Industry," "Paper Trade Journal," "Paper Mill," "Paper," and others which more frequently come to your hand so that you won't forget to come to the Exposition to see the equipment, supplies and materials which will help you make your paper better and increase your profits.

This has been sticking in the back of many heads and preventing joining with a movement which was organized entirely for their ultimate benefit.

If the Deacon is working for you, don't look on while he lets the poor horse die; educate the horse to better food.

The machinery companies have responded well and will be largely represented at the Exposition. The paper mills themselves should not neglect this opportunity of reaching the public.



NEWS FROM CANADA

NO ACTION EXPECTED IN EMBARGO

Expectations Now Are That Nothing Whatever Will Be Done About It

THERE is nothing now in the Canadian situation with respect to the proposed embargo in exports of pulpwood to the United States. It may be taken for granted that, in spite of the demand of a number of manufacturers for the imposition of such an embargo, nothing will be done during the coming session of parliament to put it into effect. The King Government is very dependent on the good will of the settlers, all of whom practically oppose the embargo, and it may be taken for granted that nothing will be done that might in any way alienate them.

In some circles of the Canadian pulp and paper industry the impression has existed that production is being so rapidly increased that the saturation point has actually been reached. That is to say in some lines the manufacturers are right up against over-production. In this connection the following interesting contribution was made at the recent pulp and paper convention in Montreal;

"New machines brought into operation during the year have enlarged our producing capacity to 75,000 tons annually of book, bond and fine papers. This far exceeds the domestic demand and world-wide conditions at present militate against us in the foreign markets. Our difficulties have been further increased by the additional tariff preference accorded the United Kingdom by our government and which has been taken advantage of, in some instances, by British paper manufacturers to undersell us in our own market."

F. W. Clarke, chairman of the groundwood pulp section, prophesied a demoralized market for the product of 1924, unless cooperative marketing were arranged.

C. Howard Smith said respecting the sulphite outlook:

"Prospects for the coming year are difficult to outline, but general opinion appears to point to quiet, steady business. The presidential election will have its effect on business in the United States and will probably not be conducive to activity in general. There will undoubtedly be keen competition from Europe, possibly greater than during the past year, so that it will be necessary for the Canadian manufacturers to pay strict attention to the costs of manufacture and other factors that will assist them in meeting this competition."

* * *

Wants Concessions

J. D. McArthur, who is the chief promoter behind the Manitoba Pulp and Paper Co., is spending some time in Ottawa, with a view to securing wider concessions in the pulp wood lands controlled by him in Manitoba, and which belong to the Canadian Government. Upon the success of these negotiations depends very largely the future of this corporation, in so far as early developments are concerned.

CANADA ANNOYED AT BECKER'S WORDS

Said That Company's Troubles Were Due to Bad Faith by Canadians

CANADIAN pulp and paper circles are rather annoyed at the bitter criticism of Sir Frederick Becker, the English paper magnate, who has been declaring before meetings of his company's shareholders that his troubles have been due largely to the bad faith of certain Canadian pulp and paper men. Senator Beique, president of the Saguenay Pulp and Power Co. has replied in the following:

1. Sir Frederick Becker was a party to my being given for ten years the nomination of five out of nine members of the board of the Saguenay Pulp and Power Co., and its subsidiaries, a condition of my accepting the presidency in 1919;

2. I agreed to accept the presidency at the reqnest of the syndicate who underwrote the $5,500,000 worth of bonds which were then issued and for the protection of the bondholders;

3. When I accepted the presidency it was understood that I would take no personal interest in the companies, except one share as qualification. I never bought a share since;

4. Sir Frederick has had to this date the nomination of four members of the board of the several companies, and throughout my actions have received the unqualified and unanimous approval of the board;

5. The form of the Ludgate Syndicate contracts agreed upon between the parties, under which the pulp was sold f.o.b. Port Alfred, contains the following: "Terms of payment; cash before delivery if required." Becker & Co., Ltd., were apparently unable to comply with this reasonable and usual clause and in connection Chicoutimi is losing heavily with them;

6. The $400,000 referred to by Sir Frederick was paid when Chandler mill was transferred to Bay Sulphite Co., Ltd., and the amount was repaid to Sir Frederick and Mr. Dubuc;

7. Since July, 1922, Becker & Co., have always been indebted to Chicoutimi Pulp Co., and their indebtedness exceeds a million dollars;

8. The collateral trust bonds were issued by Saguenay Pulp and Power Co. at the initiative of Becker & Co., Ltd., and on the expectation that same would place Chicoutimi in an easy financial position, which would have been the case had they carried out their undertaking with regard to the Ludgate Syndicate and other contracts;

9. I was at all times ready to discuss terms of settlement with Becker & Co., Ltd., or their representatives, but got no response from them. In December, I issued a printed letter addressed to the European customers of Chicoutimi, giving detailed information on the relations of the company with Becker & Co., Ltd.

DIVIDE COMMISSION IN TWO PARTS

One Section Will Handle West and the Other the East

THE Canadian Pulp Wood Commission has been divided into two sections, one for the hearing of evidence in Western Canada, and the other for the completing of this work in the eastern provinces. This has been found necessary, if a report is to be made ready for submittal and made a basis for legislative action during the approaching session of parliament.

Testifying before the western section, settlers from the northeastern portion of Manitoba said that they would starve, if an embargo were placed on exports of pulpwood. Their protests were of a very vigorous nature. One witness presented a petition signed by several hundred of settlers who declared that the sale of pulpwood was their one means of livelihood while clearing their land.

At the Sherbrook, Quebec, session of the Commission, F. J. Campbell, general manager of the Canada Paper Co., refused to commit himself on the question of the proposed embargo on exports of pulpwood; but he did think that if it were allowed to be exported to the United States, book and other miscellaneous papers made in Canada should be permitted to enter the Republic duty free. He admitted that probably American mills would object strongly to this, but thought that the magazine publishers would just as strongly favor it. Respecting timber limits he said that his company was a much larger owner than most others, having 35,000 acres of freehold and 125,000 acres of Government lands. He added that it was not true that Canadian mills did not buy large quantities of pulp wood from settlers, and in proof of his statement instanced the Brompton Pulp & Paper Co., which bought 50,000 cords outside. His company also had bought all its wood. If the Canadian mills had free access to the American market there would be a much stronger demand for poplar. In conclusion he contended that if the Americans wanted Canadian wood, that privilege should be accompanied by the free entry of Canadian paper into the United States.

* * *

'Talking Trade

An Australian trade mission is now in Canada, and in the negotiations over trade between the two countries, the question of the admittance of Canadian paper into the Commonwealth on the same preferential trade basis as that granted to Great Britain is sure to receive much consideration. How hard the existing Australian tariff regulations hit Canada is to be seen in the fact that whereas during the eight months ending November, 1922, exports of newsprint to the Commonwealth were 458,552 cwts., during the same months in 1923 they fell to 27,243 cwts. In November there were no shipments, whereas in November, 1922, they amounted to 51,000 cwts.

PAPER MILL BUILDING THROUGH CANADA

New Brunswick Government May Allow International to Proceed

REPORTS are current that the New Brunswick government which took from the International Paper Company the leases of the water power privileges at Grand Falls, may allow the company to develop the hydro-electric possibilities there. A year ago the government revoked the lease of the company on the ground of inaction, it having been charged that the company made no effort to develop the water powers there. The government planned on doing the work, but after spending $25,000 in preliminary investigation, there is apparently a hitch in the plans, and the report has been spread that the paper company will be allowed to control the development work under the supervision of the government if the company will agree to start construction on the proposed Grand Falls paper mill project this year or next year. This mill was to have been built some years ago, but owing to unforseen difficulties, the mill was not built.

Another paper mill in the Grand Falls area that was to have been constructed some years ago, but has not yet been started, was one scheduled for the mouth of the Tobique River by Fraser Companies. The Fraser Companies now operate pulp mills at Edmunston, also in the Grand Falls area and in Chatham which is near the mouth of the Miramichi River. The site of the proposed new Fraser mill was at the junction of the Tobique and St. John Rivers. Some objection has been made by salmon and trout fishermen on the Tobique on the ground that the building of the dam will impair the salmon and trout fishing on the river. However, these objections are not looked upon as very formidable. At present indications are that this deferred project may be initiated this year.

The record for speed in building paper mills in the world is claimed for the Bathurst Company's new paper mill at Bathurst. This mill was built in five months. A Walmsley newsprint machine has been installed in this mill and it is likely that another newsprint machine will be added. The executives of the company are well satisfied with the newsprint production. Much of the newsprint thus far produced has been sold to Canadian newspapers. There are two flies in the Bathurst Company ointment—Scandinavian competition and the Compensation Board. The latter body is again suing the company for non-payment of compensation rates.

* * *

A New Receivership

W. A. Black, president of the Dryden Paper Company, Dryden, Ont., in a letter to shareholders covering the annual statement, says that the finances of the company got into such an acute state that application was made to the Ontario courts for a receivership. Hope of improvement after eighteen months depression was entertained but this hope proved unattainable. Mr. Black points out that after three years of continued losses the working capital was diminished by $780,774, which left the company unable to continue. With its record it was useless to expect further financing, and the outlook for the moment, he declared, was uncertain. The balance sheet shows that the company has no net working capital. On the contrary current liabilities are $263,458 in excess of current assets.

THIS WEEK'S WINNER

J. B. DILLON

Denver, Colorado

Making of "Boy" Paper

It was out at the Meyer Pulp and Paper Mill, Denver, Colorado. A gentleman stepping out of the office escorted three ladies into the mill. One of the ladies seeing a huge pile of scrap paper, remarked:

"And is that what they make here? I thought you said they make 'boy paper' here!"

The man smiled and said:

"I repeat they do, so come this way."

At the mixing vat they saw many men engaged in assorting the scraps of paper and then dropping it into the vat, and after a time they reached the finished card board. The man said:

"Well, Lois, here's the boy paper!"

"Why boy?"

"Rags and tags and paper bags that's what little boys are made of."

New Plant Operating

The new Jones beaters and other equipment changing over part of the news mill of Consolidated Water Power & Pa. Co. Wisconsin Rapids, Wisconsin, to manufacturing 20 bleached papers for bread wraps, is in operation and one of the 132" Beloit machines is now turning out this new grade for these mills, of a good quality at a very satisfactory rate of speed.

Lyman Beeman for so many years an expert of the Kimberly-Clark Company, has been associated with the Consolidated Company for the past six months and is aiding in keeping this new grade up to the standard required.

The Consolidated Mills get their bleached pulp from their own slow cook sulphite mills at Appleton, known as Interlake Pulp & Paper Co.

* * *

IT SURE DID

In Boston a man was showing a British visitor the sights of the Hub. They were driving past Bunker Hill Monument. Not wishing to make any pointed reference to the fact that at one time we had been fighting with our cousins, the Boston gentleman merely indicated the monument with his thumb and said: "Bunker Hill."

The Englishman looked at the hill intently and asked: "Who was Mr. Bunker, and what did he do to the hill?"

"You don't understand," said the Bostonian. "This is where Warren fell."

The Englishman screwed his monocle into his eye, leaned back, and, looking at the top of the towering shaft, remarked inquiringly, "Killed him, of course?"

* * *

A healthful tip for the winter months—sleep with your window open and your mouth shut.

NEW MILL TO BE READY SOON

Work of Construction Will be Rushed to Complete it This Year

THE pulp mill and paper mill to be built on the Manicouguan River, by English newspaper interests, will be ready for operation late in 1924, according to existing indications. The work of construction will be rushed. The amount to be spent in the construction will exceed ten millions.

Factors in the building of the mills are a number of newspaper publishers of England who recently effected a combine, under which a group of important newspapers, dailies and weeklies, are being directed by one syndicate, headed by Lord Rothermere. Not long ago, a son of Lord Rothermore, and a nephew of the late Lord Northcliffe, toured Canada seeking a site for the pulp and paper mills, and chose the Manicouguan River territory.

The St. George Pulp and Paper Company, maintaining a mill at St. George, N. B., and another at Norwalk, Conn., may enlarge the St. George mill and increase the capacity. The St. George mill is one of the oldest pulp mills in Canada. It was founded by United States interests, and operated in conjunction with Canadian capital for more than forty years. Later the property changed hands, the New York World Publishing Company being interested in the new organization. Shipment of the pulp to the Norwalk mill from the St. George mill has been mostly by water, St. George being on the Bay of Fundy near the mouth of the bay.

With the prospect of cheap power from the proposed harnessing of the Bay of Fundy, there are indications that the St. George mill will be enlarged, and the extension may result in the doubling of production. Besides the proposed harnessing development, the mill is also within a short distance of the new hydro-electric station at Musquash River. The St. George mill is located amid a fertile pulpwood growing section. In this territory there has been much replanting, and thinning during the past few years and in a few years, the pulpwood supply is expected to be more extensive than ever. This section has not suffered heavily from the forest fires. In addition, there is much available pulpwood in the company's lands surrounding the mill site.

* * *

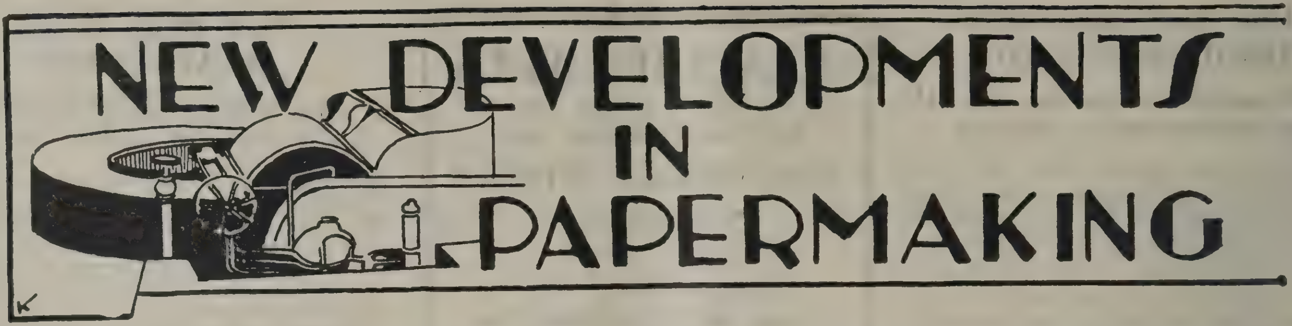
The debenture and noteholders of the Becker Wood Pulp Co., were told at a meeting in London, England, the other day, that their main chance of recovering anything was in the continuance of the Chicoutimi Company. It was admitted that the position of the company as respects working capital is critical, but it was also explained that the management, in spite of grave difficulties, was doing everything possible to prevent liquidation and was prepared to assume a reasonable attitude towards the Becker claims. The official receiver said: "The amount you will eventually receive is highly problematical. The Becker failure is largely due to over-trading, followed by the usual consequences."

* * *

A school nurse was telling a health story to a first-grade class. "Now what," she asked in review of the story, "was the name of the good fairy that was dressed all in white?" For a moment the class was silent, then a little colored bay answered hopefully, "Ku Klux?"

* * *

We used to shudder at the speed of express trains; now man travels 200 miles an hour, and faster, and lives to tell of it.

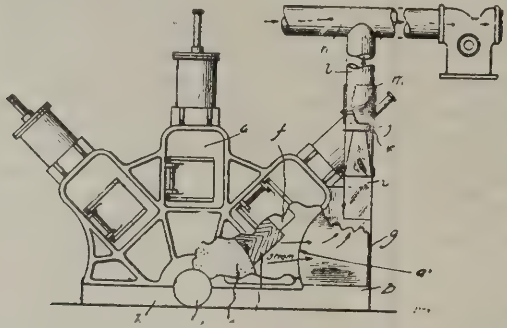


NEW DEVELOPMENTS IN PAPERMAKING

Removing Steam in Pulp Grinders

The accompanying figure shows the device which is patented in United States Patent No. 1,481,584 and which is designed for the purpose of removing the steam in a paper pulp grinder.

The housing of the grinder is provided with crevices in its walls and a relatively large opening at one side. There is also a supplementary housing section which is also open at one side in correspondence with the side opening of the main housing and this supplementary housing is made in such a manner that its walls are adapted to be placed in abutment with the walls of the main housing and in this manner there is formed a chamber of substantial dimensions. Means are provided for producing a draft from this chamber to the atmosphere, which results in the creation of a region of negative pressure in the chamber. The net result of this is that air is tended to be drawn into this chamber from the outside through the openings in the main housing. Arrangements are also provided so that the two sections of the housing may be easily taken apart.

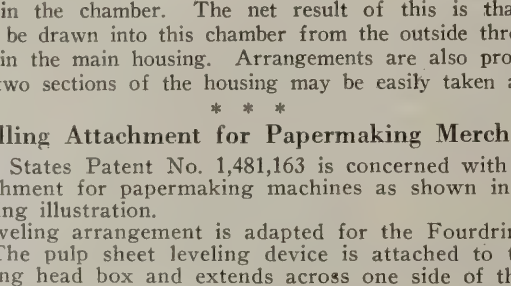


* * *

Levelling Attachment for Papermaking Merchants

United States Patent No. 1,481,163 is concerned with a leveling attachment for papermaking machines as shown in the accompanying illustration.

The leveling arrangement is adapted for the Fourdrinier machine. The pulp sheet leveling device is attached to the pulp distributing head box and extends across one side of the same.



The plate which is an essential part of the leveling device is just wide enough to extend across the width of the head box and has its lower end spaced from the wire to form a pulp feeding orifice. Brackets are used to support the plate and an arrangement is provided whereby it is possible to raise or lower the plate at will, so that the distance between the wire and its lower end is increased or decreased and thereby the thickness of the paper web. There is also provided an arrangement for warping the plate so that the thickness of the pulp sheet at different points on the wire may be increased or decreased.

* * *

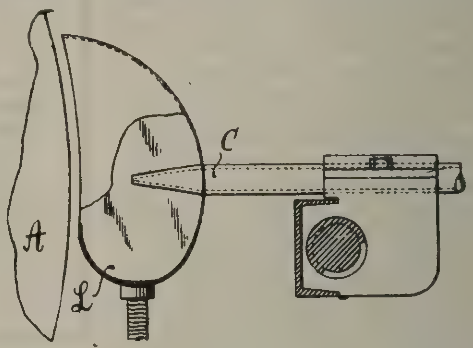
Removal of Organic Matter from Waste Liquors

Norwegian Patent No. 34,836 is concerned with a process of removing the organic matter from waste cellulose liquors by means of the gases that are obtained from the roasting process. This gas is derived from the roasting of sulphide minerals or sulphur and is exposed to the action of electric sparks which convert the oxygen into ozone. This compound then oxidizes the sulphur dioxide in the gas to sulphur trioxide. This gas is then lead into the waste liquors which absorb it. The liquors are then brought up to the proper temperature and pressure required for precipitation, that is decomposition, of the organic matters that are contained in it.

Sharpening Grinder Stones

German Patent No. 386,500 is concerned with a method and apparatus for sharpening grinder stones, particularly those employed in the manufacture of mechanical wood pulp. The accompanying figure shows the arrangement of the apparatus.

A fine stream of water or other liquid is caused to impinge upon the surface of the grinder stone. This stream of water or weak acid issues forth from the nozzle C. The grinder stone is seen at A. The stream of water is under considerable pressure. This effects the removal of all foreign bodies and impurities from the surface of the stone. The strong spray also washes away small particles of the stone which have been partly broken off during the grinding operations or which is actually eaten away by the strength of the spray of water. In this way a rather rough surface is attained on the stone A.



The spraying of the stone may be intermittent or else continuous and the nozzle is moved back and forth across the width of the stone so that every part of it is subjected to the action of the spray. The pressure at which the stream of water is directed against the surface of the grinder stone depends on the hardness of the stone itself and it may also be regulated so that any desirable surface may be given to the stone. It is also possible to direct streams of water from more than one nozzle against the stone surface. All these nozzles are provided with arrangements which permit their moving back and forth across the width of the stone.

In order to avoid that the particles of sand and stone, which are loosened up by the action of the stream of water, mixing with the mechanical wood pulp that is produced by the stone, the water which is bound back from the stone is made to flow through a certain channel and is thereby lead away from the grinder and does not mix with the pulp. The channel is seen at L.

* * *

German Patent No. 383,862

In a previous patent the inventor describes an arrangement consisting of a drying chamber, partially exhausted of air, in which the wet paper web is given a certain degree of tension by means of guide rollers which are placed between the drying cylinders without actually coming in contact with them.

The device which is patented in the present patent, German Patent No. 386,503 is an improvement over the aforedescribed apparatus. In the new drying arrangement the cylinders over which the wet paper web passes is dried and heated by electricity. The advantage of the use of electricity for this purpose lies in the ease with which the heating is regulated. This is particularly important in this case for the low air pressure within the drying chamber makes it necessary to employ a comparatively low temperature for drying purposes. This naturally requires fine regulation which can be accomplished by using the electric current as the heating agent.

Another important advantage of the use of electricity for this purpose is the comparatively small amount of space taken up by heating and drying cylinders with the result that the chamber may be made in small size and heat losses are correspondingly reduced. The radiant heat effect of electricity is also very well suited for drying the paper web in the partially evacuated chamber.

The Editorial Page

More Attention to Power

NOT sufficient attention is being paid in the paper mill to the power plant, the cost, efficiency and modernity of it. It is the old, old tale. There is absolutely nothing new in it.

As long as the old machine is turning out the goods, up to standard, without stops, as fast as it is supposed to turn it out according to records already established, who cares a hoot about how the power plant is working? To say nobody is interested is in error, but the number is very few.

The money men in the paper mill scarcely think about the power plant and the various ways it could be improved, oftentimes at small cost. The papermakers themselves give only a passing thought to power and its supplementary part in the mill, because their prime business is to make paper. As long as the wheels go around, drying is being properly done and nothing squeaks, everything must be all right. The engineers in the mill have a multiplicity of problems. Hence power is frequently neglected.

Are electricity, water and steam doing for you everything they can do and in the best way possible? Is everything being shouldered off on steam when its brother electricity might lend a helping hand? Or vice versa? Can you use water and how? Are all of those little needs in the mill for steam or current being filled adequately? These are pertinent questions. To solve them satisfactorily will save many dollars in a plant and will be just that much more velvet—for the Lord knows the velvet in the paper mill is minute and infinitesimal enough now.

Stop a moment and consider if your mill cannot be improved in its power plant, and by that we do not mean just the motor or force that turns the big wheels of the machinery. For there are a myriad minor uses of power in every angle of the mill that are worth considering. When a wrong goes on year after year, even though it be only a tiny wrong, time makes it a big wrong.

Of course, there is sanity in everything. Just because one system doesn't seem to be giving quite as fine and as pretty a service as a whole new plant, it is not always a reason to spend thousands of dollars in renewing or changing the entire outfit. The initial cost would sometimes eat up more than the small loss that is being sustained. But there is a sane, middle ground, and what must be done must be determined by the individual cases.

But at any rate thorough investigation into power and power plants, down to the last end of an exhaust steam pipe is worth while. If it doesn't reveal glaring errors it may at least satisfy your mind there is no leak in that department anyway.

Give a thought or two to the power plant. It may save you money.

On The Job

IF a business is successful, I know that somewhere in the organization is a man who is eating and sleeping with his job.

Men are always trying to get their income-producing enterprises into such shape that they can go off and leave them.

If they are successful in selecting and developing assistants this plan sometimes works out well, but assistants who are employed under these circumstances must be paid so much that usually little profit is left for the absentee owners.

No law seems to be as sure as this: That the price of success is hard work.

I recall once a member of the board of directors of an association which employed an executive secretary. This secretary seemed to be the most efficient man I had ever known. The board met only about once a year to vote an increase in the secretary's salary and to exchange stories.

This went on for three or four years. Apparently the association was thriving. I congratulated myself, feeling that for once in my life I held a position of honor and distinction which involved no work or worry, says Mr. Feather.

We eventually discovered, of course, that instead of matters being all right they were all rotten. To the membership, the directors looked like a lot of boobs —which we were.

We had to pitch in, work overtime, and correct our mistakes.

Yet, all of us keep trying to get our affairs on an automatic basis.

We seek investments that are safe without watching, helpers that will work without prodding, secretaries that will act without instructions.

Usually, however, when the showdown comes we find we have paid a long price for our temporary freedom from worry and responsibility. We return to a state of affairs like that which greets a housewife when she comes home from her vacation—a kitchen full of dirty dishes, a living room littered with newspapers and cigar ashes, bedrooms that look as though burglars had raided and slept in them.

PAPER PRODUCTS

Conducted by J. E. Willert

Just a Sample

St. Valentines,
February 14, 1924.

Dear Everybody:

Don't you like to get letters? I do. The first thing I look for in the morning at the office are letters, some are fine, like beautiful valentines, others are comics.

Letters are like people, formal, serious, gabby and humorous.

Sales letters are my favorites, they are so full of human nature, some of the writers try to be so different that they cease to be human beings, others are just like folks; chock full of good stuff.

After all, we are just folks and should talk to one another on paper just the same as face to face, that's just what I do in my Twiller Sales letters. Just believing in the goods all I know how I tell my prospect my belief and the power of my letter is my ability to impress my belief on others.

The power of my belief is this. That there is no commodity made that has not in it the qualifications to take care of the situation for which it was made and that I have the ability to present a word picture so vivid that any person can see the desirability of a commodity and be willing to buy.

There is a genuine pleasure in selling, gotten out of seeing others buy something of value and profit to them. That's why I write Twiller Sales letters.

I can do for you the very thing I would like somebody to do for me were I manufacturing, that is, popularize and sell your goods.

The advertisement in PAPER introduces you to the Jobber's business family. The Twiller Sales letter that goes with the advertisement develops a family intimacy, it becomes the welcome touch, the letter from a friend.

I have been asked, "why call yourself Twiller?" Well, it's easy to say and easy to remember, I just twisted the letters in my regular name which is

Salesfully yours
J. E. WILLERT

P. S. Twiller Sales letters go with advertisements in PAPER. Paper specialties have a definite and distinctive place and need definite and distinctive advertising.

* * *

At the Exposition

Last year at the Paper Industries Exposition a man rushed in and up to the booth of an exhibitor and breathlessly said, "Just got a minute, want to see you, got a lot of letters from you, fine line you have, no time to look around, hurrying for train, haven't been here before but had to see you, you'll hear from me. I'm a customer from now on." Throwing down his card he rushed away.

That exhibitor had used Twiller Sales Letters. They caused a prospect to nearly lose his train just to see the exhibitor's merchandise and made a customer. They can work for you. They go with advertising in PAPER. Send for information.

The Development of An Idea

By J. E. WILLERT

The development of the idea of an organization that may be known as "The American Association of Paper Specialty Maufacturers" is now in process. The important value of such an association with a definite purpose unhampered by a heavy expense is obvious. It is full of potential possibilities.

Foremost in the activities of real associational work is that cooperation which contributes a real benefit to its members, a reciprocal relation that increases distribution and a jealous oversight of the dignity of the Association.

The plans of the Association as far as formed comprehend a wide scope of operation, an adoption of a high order of method and practice and an economy of maintenance consistent with the perfect service that will be rendered.

All manufacturers of Paper Specialties, which includes special branded wrappings, toilet paper, napkins, paper towels, ice cream boxes, paper plates, paper cans, oyster pails, paper cups, paper spoons, parchment paper wrappings, paper bags of all kinds and the ever increasing line of specialty manufacturers, should be banded together in an Association that would bring about a mutuality of interest and protection, a resultant economy of distribution and the removing of dangers that impede the industry.

Such an Association with such a code of principles will appeal strongly to the distributor, generating confidence in Association goods and guaranteeing to the distributor a perfect service.

The American Association of Paper Specialty Manufacturers offers to the manufacturer a channel through which stabilization, understanding, economy and enlargement of distribution can be reached.

Full information on this subject can be obtained by addressing J. E. Willert, 152 West 42nd Street, New York City.

TWILLER SALES TALKS

Success likes company. Tell your customer the successful selling plans others are using.

* * *

Neighborhoods reflect the storekeeper's needs. Know the neighborhood.

* * *

Rest is just a change of thought. Give your customer a rest. Be versatile.

* * *

Remember your style reflects your ability, so have a good style.

* * *

Everybody knows some one thing better than you do. Learn what it is and use it.

Tell Them

The things you are most familiar with are those you see and hear about the most often.

So, if you want the trade to be familiar with your product you must let them hear from you often.

No matter how fine a production you have you must advertise it to popularize it.

All jobbers want to handle the best product they can get hold of so it is up to you to tell them about yours.

A trade paper is one channel, a sales letter another, together they are a mighty rush — the combination cannot be withstood. Try this way to tell them.

It's the every week repetition that makes them familiar with your name, it's your importunity that makes them order, it's the quality of your goods and service that makes them your permanent customers.

To start them you must tell them, to make them order you must tell them, to make continuous customers you must tell them. ADVERTISE and TELL THEM.

* * *

Wright Is Right

John Howie Wright, Manufacturer, Publisher, Editor and Direct Mail Expert says: "For every man who knows how to sell there are a hundred who know how to make. It takes more to sell a product than it takes to make a product."

John Howie Wright is right. We live in a critical, skeptical time, you've got to do some convincing nowadays. Constant advertising is convincing and the manufacturer who keeps at it will sell when others stand wonderingly by.

You have in your employ the best skilled help making your product, and you must have superskilled help in manufacturing a demand for it.

If you do not keep your machines in perfect running order and continually at it your product degenerates.

So must you keep your advertising, your sales manufacturing machinery, continually at work.

PAPER'S PLAN PRODUCES PATRONAGE.

* * *

Occupy New Plant

Warren Webster & Company of Camden, New Jersey, manufacturers of steam heating systems, feed-water heaters and steam specialties, have moved into their new plant at Federal and Seventeenth Streets, Camden.

While the move was made necessary by the fact that the former plant is on the site taken for the new Camden-Philadelphia bridge, now under construction, improved facilities have been provided and allowance made for extension.

Warren Webster & Company are known as pioneers in the development of steam heating systems. The company started business in Philadelphia in 1888 and moved to the plant just vacated five years later, extending it at four different times to provide increased manufacturing facilities.

Short News Briefs

Purity Paper Vessels Co., of Baltimore, have opened an office in the Canadian Pacific Building in New York City. Mr. W. A. Palmer is the Supervisor of Sales for the Metropolitan District.

* * *

Mr. A. E. MacAdam, Sr., of A. E. MacAdam & Co., Inc., Brooklyn, N. Y., has returned to his business after having recuperated from a severe cold.

* * *

The Metropolitan Bag & Paper Jobbers Association of N. Y. City will hold their annual dinner on March 13th at St. George's Hotel, Brooklyn.

* * *

MacAdam & Foster Co., Inc., Brooklyn are enjoying a good demand on their line of Ice Cream Pails and Candy Boxes.

* * *

There is a very optimistic feeling among the woodpulp board makers. Orders are now coming along for good quantities.

* * *

Mark Twain's spider looking for a place to build his web where he would not be disturbed scanning the newspaper discovered that one storekeeper did not advertise, the spider built his web across this storekeeper's door and lived happily ever after.

* * *

A certain concern prided themselves on their conservatism stating, "we just have a perfunctory advertisement in one trade paper." They did a short lived perfunctory business and made a perfunctory failure. The unusual advertisement means an unusual business with unusual success. Hitch on the Twiller Sales Service.

NEW GENERATOR FOR UNION BAG

General Electric Company Installs a Steam Generator in Hudson Falls Plant

A RECENT application of an electric steam generator is the installation of one of these units in the Hudson Falls, N. Y., plant of the Union Bag & Paper Company. This plant is devoted to the manufacture of paper, paper bags and other paper products, and the steam generator recently installed will furnish steam for heating purposes and process work throughout the plant.

The generator was built by the General Electric Company, is rated 5,000 Kilowatt, 6,600 volt, 500 boiler horsepower, and is designed to generate steam at 100 pounds' pressure. The generator operates in parallel with other fuel-fired boilers, but its operation is mostly confined to periods of high water and non-working days, when an excess of water is available for operating the power plant generators. In normal times, the fuel-fired boilers carry the steam load.

In the Hudson plant the operating conditions are such that the steam demand is very constant and the generator, for this reason, is equipped only with hand control. This consists of a valve in the discharge side of the hot water circulating pump. This valve regulates the water level in the electrode chamber of the generator to such a height as to convert into steam whatever power is available up to the capacity of the generator.

The generator is located in the same room as the fuel-fired boilers and takes up a floor space of approximately six by ten feet, with a 24-foot headroom for the pump, shell and primary switchboard panel. The unit is operated by the same crew operating the fuel-fired boilers, no increase in boiler room force being necessary.

* * *

SAFETY PAPER COMPANY BUILDING ADDITION

Perfect Safety Paper Company to Soon Put New Plant in Operation

THE Perfect Safety Paper Company, of Holyoke, Mass., has now under construction an addition to their mill. The new addition is of brick construction, 60x70 feet in dimensions. It has a saw-tooth roof machine room to give more light and ventilation.

Part of the machinery that will eventually be located there is already installed, with the rest scheduled to be soon there. The Casper Ranger Construction Company has the job of constructing the new building, while Fletcher-Thompson, Inc., of Bridgeport, Conn., was the engineering company.

It will be some months before it is ready for actual operation, but the work is being pushed with all rapidity. The company specializes in safety paper for bank checks and other negotiable documents. J. B. Weiss is the president of the company which has during the last few years been making steady progressive strides.

* * *

New Paper Jobbers

To take over the business formerly conducted by Turner Brothers in Peterboro, Ont., Card and Paper Works, Limited, has been formed in that city and has been granted an Ontario charter. The authorized capital of the new concern is $75,000. They will operate as paper jobbers.

IF YOU SAW , , ,

2000 potential buying jobbers all reading your Advertising and the story of your product in PAPER and then handing it over to 8000 of their salesmen to read, wouldn't that be a grand sight?

Well, that's just what's going to happen. Our issue of February 21st will be read by 2000 potential buyers and then by 8000 or more salesmen.

Your advertisement can be in it! !

It is not too late! !

Telegraph, Night Letter or Telephone in your copy.

PAPER will tell how, when and where to sell the product of our Advertisers. Big, economical, effective advertising for you.

You'll want to be in it and want every issue of PAPER.

Through the Middle West

New Pulp Unit For Nepco

At the last meeting of the Board of Directors of Nepco, it was learned today, a new pulp unit was authorized for the Port Edwards mill. Orders have already been placed for the necessary machinery, grinders, pulp refiners and it is hoped that the new machinery will be in operation by April 1st at the latest.

E. P. Gleason, engineer in charge, and John Walley, superintendent of construction, have the work in hand and everything arranged for.

This new unit will not greatly increase the product, but will cause greater economies and will greatly reduce the cost at certain times of the year.

Some machinery will be moved up from the Nekoosa mill and be added to the Port Edwards equipment and before the year 1924 is over, it is hoped that the manufacture of groundwood will be entirely removed from the Nekoosa mill.

* * *

New Paper Machine Screens

The machine at Port Edwards, known as No. 6, a 116" Beloit newsprint machine operating at speeds up to 650 feet per minute, is to be equipped with new screens of the Bird type universally used on new installations. Delivery will be made early in April and it is hoped that the transfer from the large number of flat screens to the two new screens of the Revolving type, can be made without any loss of time.

DISCUSSES ELECTRICITY IN PAPER MILL

Kimberly-Clark Official Gives Practical Address on Electrical Part of Mill

JOSEPH DOERFLER, chief electrician for the Kimberly-Clark Company, at Appleton, Wis., addressing the Y. M. C. A. Industrial forum, discussed "Electrical Drives." He illustrated his talk with charts showing how electrical drives are applied to paper mill machinery. Many paper mill men attended.

Mr. Doerfler explained that motors on paper mill machinery are so arranged that they automatically take up the slack in the paper, whereas with the steam drive the change of speed depends on the governors which do not operate until the actual change in speed takes place in the machine itself.

With electrical drives Mr. Doerfler said a paper machine will turn out a greater amount of paper than with the old form of drive. Electrical drives do away with shafting, he said, and their installation is more expensive than the old style steam driven machinery.

The Niagara Mill of the Kimberly-Clark Company was the second paper mill in the country, according to the speaker, to install the electrical drive. The first was a California mill, Mr. Doerfler said. The electrical drive is comparatively new and is being constantly improved, it was said.

"Printing and Its Relation to Paper" will be the subject of the next forum address to be delivered by Eugene Colvin.

Nepco Bleach Plant

The new bleach plant at Port Edwards Mill of Nekoosa Edwards Paper Company has started and is making a fine grade of bleached sulphite pulp.

Equipment for the use of liquid chlorine has been installed and the Company now produce its bleach liquor at the minimum of cost.

The Bellmer Bleachers, the Rogers wet machine and all other equipment is of the latest design and the arrangement is of the best approved type.

The new Yankee machine at Port Edwards is now producing bleached M. G. papers in 20, 23, 25 and 30 and with the already large line of M. G. papers in sulphite Kraft with the present large demand, things are very busy around Nepco mills, both in Nekoosa and Port Edwards.

January shipments were the largest ever heard of in the business of the Nekoosa Edwards Paper Company and orders for February looks like it will be a repetition.

It keeps some shipping crew to handle 200 tons per day of counter rolls, averaging around 35 to the roll, some 12,000 rolls per day being made and shipped.

Profits and Costs

THOSE significant sheets which tell the story of your business—what trifling items will sometimes affect them—to your benefit or otherwise. Every executive in the paper industry who is thoroughly alive to the importance of keeping in close touch with the elements which affect profits and costs to any degree, will be an interested visitor at the

SECOND ANNUAL
PAPER
INDUSTRIES EXPOSITION

Week of
April 7th
1924

Grand
Central
Palace
New York

On the main floor this year

You'll see and hear something new and helpful every time you turn around. Exhibits of manufacturers will show how others have met the same problems you have encountered. You will see how machinery, supplies, methods, ideas of management, etc., can lower your production costs, increase the efficiency and the quality of your products.

Paper merchants, printers, advertising men and those who buy and use your products will be there in countless numbers, to learn more about paper.

An exhibit of your own will be a material factor in making those profit and cost sheets look more attractive to you. All those paper buyers will be greatly influenced by the knowledge of your paper which you can give graphically through your exhibit.

Get your sales department in action—write for diagram and cost of spaces.

Paper Industries Exposition, Grand Central Palace, New York

Paper and Board

New York, February 12—While reports continue to tell of a comparatively slow movement of several kinds of paper, the markets as a whole is fairly active and characterized by considerable firmness. Consumers are still proceeding cautiously in purchasing paper. There are few users who show interest in other than supplies directly required, and while it is true that the needs of some consumers are on the increase, thus bringing them into the market for larger amounts of paper, the process of improvement is so gradual that the effect on the market is scarcely observable

There is keen competition between paper manufacturers for business. This especially applies to book and wrapping paper producers. The demand for book paper, although decidedly improved over a few weeks ago, does not begin to approximate a volume ample to keep all mills fully occupied, and there is consequently a drive on by the various members of this branch of the trade to corral all the orders it is possible for each to secure, thereby making for some easiness in prices. Book paper mills are not hesitating to shade asked prices to obtain business. Some are cutting pretty deep in certain instances and low prices are mentioned now and then in different parts of the market. It is stated for example, that machine finished book paper has sold at as low as 5.75 cents per pound f. o b. New York, though it is acknowledged that book paper bought at this price was not of No. 1 quality. The average price quoted on a good grade of machine finished book is about 6.25c a pound f. o. b. New York, with quotations ranging from a low of 5.75c up to 7c. Coated book paper is quoted at from 8c a pound upward f. o. b. New York, with 9c about an average figure on such paper of the usual run of quality.

Wrapping paper is in limited demand. Importers continue to undersell domestic manufacturers, and are said to be securing the bulk of current business. Domestic producers of No. 1 kraft wrapping quote about 6c a pound New York, against a price of 5.50c or slightly higher for the imported product of similar grade. European manufacturers are reported quoting No. 1 kraft wrapping at approximately 4c a pound f. o. b. ports of shipment on the other side of the Atlantic, which with duty of one-third and frieght, brings the cost to importers up to around 5.25c, the freight, it is said, being a negligible matter since it amounts to something like 15 cents a hundred pounds.

Newsprint is firm and in a stable market position. Publishers are consuming print paper in heavy tonnage, and are steadily absorbing supplies from mills. Manufacturers with few exceptions are well booked on orders for shipment for several months ahead, and there is not much newsprint available in the spot market.

Fine papers are showing consistent improvement. Demand is slowly though surely expanding, and prices are stiffening. Increasing cost of raw materials, notably rag stock, is one of the main factors in the market, and manufacturers assert there will necessarily have to be further advances in fine paper prices to catch up with the sharp rise in production costs due chiefly to the high price of raw material.

The board market is quiet. Mills in the East are competing with one another and there is some price cutting indulged in. Latest quotations range around $42.50 a ton f. o. b. New York on plain chip board, and $45 upward on news board, with one of the large Eastern mills reported quoting $42.50 on both news and chip. Paper box manufacturers are buying board in small amounts, as a rule, and mills in general are operating on a curtailed schedule.

Mechanical Pulp

Prices of mechanical pulp are holding at about stationary levels. Most producers in the United States and Canada quote from $35 upward f. o. b. pulp mills for spruce ground wood for spot shipment, prices depending on the air dry test and the freight to consuming points and in some cases quotations ranging up to around $40 Indications point to a fair movement of ground wood. There is no unusual demand originating in any one consuming quarter, yet buyers in general are absorbing supplies in a There is no unusual demand originating in any one consuming quarter, yet buyers in general are absorbing supplies in a steady manner. Reports assert that there are good-sized quantities of Scandinavian ground wood on the spot in this country, for which importers ask around $32 a ton ex dock New York or other American Atlantic ports.

Foreign and Domestic Chemical Pulp

There is not much worthwhile improvement in chemical wood pulp. The market is at best quiet, and such demand as is developing is of very spotty character and mostly coming from consumers who are bent on purchasing pulp at price concessions. Moreover, indications are that available supplies are of such size as to make it necessary for sellers to be on the defensive, so to speak, at all times, and to grant the price reductions asked by buyers to accomplish sales.

Bleached sulphite is quoted at around 4 cents a pound f. o. b. pulp mills for No. 1 domestic sulphite, and at a range of 3.75 to 4 cents per pound ex dock New York for No. 1 foreign bleached sulphite. Unbleached sulphite of strong foreign quality is quoted at 2.60 to 2.75 cents per pound, with an occasional sale down to 2.50 cents ex dock New York reported. Kraft pulp is quotably easy and importers admit having difficulty including paper or board manufacturers to pay above 2.50 cents per pound for No. 1 Swedish kraft on the dock at New York, and some sales at lower prices have been reported. Stress is placed on the higher quotations from abroad, and the fact that sales are being made in the United States at below the cost of replacement in Europe, and members of the trade aver the prevailing market situation cannot continue indefinitely. Quotations ex dock New York and f. o. b. pulp mills are:

Sulphite foreign—

Domestic Rags

All grades of papermaking rags are very firm in price; in fact, the tone is strong, and higher market levels prevail on some kinds of rags. Demand is active, particularly for the low qualities used by roofing paper manufacturers. No. 1 roofing stock has sold at 2.50 cents a pound f. o. b. New York, and No. 2 packing has brought 2.30 cents and higher f. o. b. this city. Old thirds and blues are advancing, and replaced blues are quoted at 3.25 to 3.50 cents per pound at shipping points and miscellaneous packing at close to 3 cents. Old white rags are in demand and gradually moving upward in price. New cuttings of all kinds show an advancing price trend, with most grades freely inquired for by consumers. A feature in the market is that consumers other than papermakers are active buyers at present. The high price of raw cotton is causing manufacturers of cotton substitutes, such as shoddy and shredded materials, to purchase rags in abnormally large amounts, thus accounting in a measure for the strong prices prevailing. Prices on a f. o. b. New York basis follow:

New Shirt Cuttings,

Imported Rags

Foreign papermaking rags also are in a strong market position and are gradually advancing in price. Dark colored cottons have sold to roofing paper mills at 2.15 to 2.25 cents a pound dock New York, while blue cottons are fetching 3.50 cents and higher, depending on grade and tonnage. Linen rags are in good demand and are offered by importers in rather small amounts. Quotations ex dock New York are:

The Pickles Drying Regulator

Reasons why you should have it on your machine are: First, it regulates the drying of paper automatically, irregularities are eliminated; second, higher machine finished papers are attainable, because it is possible to maintain the proper quantity of moisture in sheet, as it passes to calenders; third, mills having tried it on one machine have ordered it for all their machines. Full particulars upon application to

FITCHBURG - MASSACHUSETTS

Bagging, Rope, Etc.

A steady demand emanates from paper mills for old rope and prices hold firm. No. 1 domestic manila rope is selling at 6.50 to 6.75 cents a pound f. o. b. New York, and foreign manila rope is quoted by importers at 6.25 to 6.50 cents ex dock. Old bagging is in spotty demand. Roofing bagging is moving in fair quantities at prices of around 1.20 cents a pound f. o. b. New York, and No. 1 scrap bagging is quoted at 1.25 to 1.50 cents New York, prices depending on the quality of packing. F. o. b. New York quotations are as follows:

Gunny No. 1	1.50 @ 1.60	Wool Tares, heavy	1.50 @ 1.60
Foreign	1.40 @ 1.50	For. Manila Rope	6.25 @ 6.50
Wool Tares, light	1.40 @ 1.50	Domestic Rope	6.50 @ 6.75
Scrap Bagging, No. 1	1.25 @ 1.55	Mixed Strings	1.00 @ 1.25
Roofing Bagging	1.15 @ 1.25		

Old Paper

A good demand of increasing dimensions exists for the low grades of old paper, whereas most of the better qualities are noticeably neglected by consumers, No. 1 hard white shavings, for example, are almost a drug on the market, with dealers in New York offering this stock to mills at 3.75 cents a pound f. o. b. this city and failing to secure orders. Soft white shavings also are quiet though some few sales at about 3 cents a pound New York are reported. Old folded newspapers are selling at 95 cents to $1 a hundred pounds f. o. b. New York, and No. 1 mixed papers have advanced to 75 to 80 cents a hundred pounds New York. Old kraft paper is a firm item and is bringing 2.25 cents a pound at shipping points, while white blank news is quoted at the same figure. Magazines are in fair demand but buyers seem to be filling their wants through purchases at about a price basis of 1.60 cents f. o. b. this city. Quotations f. o. b. New York are:

No. 1 Hard White Shavings	3.70 @ 3.90	Ledger Stock	1.90 @ 2.10
No. 2 Hard White Shavings	3.15 @ 3.40	Kraft No. 1	2.20 @ 2.30
No. 1 Soft White Shavings	2.90 @ 3.10	New Manila Cuttings	2.00 @ 2.25

Solid Ledger Books	2.00 @ 2.15	No. 1 Mixed Papers	.75 @ .80
		White Blank News	2.25 @ 2.35
		Common Paper	.50 @ .55

Twines

Twine prices display a hardening tendency. Raw material has been advancing in a consistent manner for some time and is commencing to have influence on values of the finished product. Demand is nothing more than routine, however, and the market is at best limited in compass. Quotations are as follows:

Sisal Hay, pure	14.25 @ 15.25	Jute Wrapping twine, A grade	20.00 @
Manila Hay, pure	16.25 @ 17.25	Papermakers Twine	11.50 @

Jute rope, ¼ diam. and over, coils	13.00 @ 15.00	America Light India— No. 6	14.50 @
Sail twine, A grade	20.00 @	No. 7	13.50 @

Chemicals

There is a fairly steady movement of papermaking chemicals, and prices are marked by firmness. Bleaching powder is quoted at from 1.50 cents a pound upward f. o. b. works, depending on the shipment desired. Casein is steady at 13 to 15 cents per pound, duty paid on the foreign product. Caustic soda is quoted at around 3.15 cents per pound at works for spot shipment, and soda ash at 1.40 to 1.50 cents a pound f. o. b. shipping points

Coating and Drying

A process for coating and drying a paper web has been patented in ngland. The apparatus that is employed in this process is seen rom the accompanying figure.

The web of paper, designated by 1 in the figure, passes through mercury seal 4, passing around the rollers 29 which are im- nersed in the mercury. The mercury is kept hot by suitable means. Then the web passes through a bath 7 which contains the liquid with which the paper is to be impregnated and round other rollers 29 which exert a drying action and then out of the evacuated chamber 5 by way of the second liquid seal 4 to a winding spool 19. The bath 7 may be alternately located at the entrance or exit of the chamber and the drying means may take the other forms such as heated cylinders or electric heaters between suspended loops of the material.

Recovery of Products in Waste Liquors

French Patent No. 558,183 is concerned with a new process of recovering the values in waste liquors derived from paper manufacturing processes and the heat that is contained in the organic materials that are dissolved in these liquors. The process consists in mixing the waste liquors with a liquid combustible, such as fuel oil, anthracine oil or crude low grade petroleum (mazout) and then the entire mixture is burnt. The inventor claims that the burning process when carried out in this way is complete and all the heat that is contained in these liquors in the form of dissolved organic substances is recovered and can be used to good advantage in heating steam boilers. The residual matter is inorganic in nature and can be recovered almost completely and in a rather pure condition after the organic matter has been burnt off.

ORR FELTS and JACKETS

Lowest Cost per Ton

If you judge felt values, not by what you put into the equipment, but what you get out of it—then you will specify ORR 3 stripe Endless Felts for ORR felts will produce the lowest cost per ton. They "stand up" under severe usage. Orr durability is acknowledged everywhere. Their strength and long life are as dependable as their reliability and quality.

In the 32 grades of Felts and Jackets we can match your most exacting demands. Tell us the kind of paper you desire to make, and we will send you samples of felts that will economically serve you and help you to produce paper at lowest cost per ton.

GREEN-BAY WIRE WORKS

Use
Green Bay
Wires
FOR
Larger Tonnage

With over 20 years of practical experience in the wire business, we started our present plant six years ago and in spite of the adverse conditions of the paper industry, we have brought our production up to over half million sq. ft. per year. We are constantly adding to our list of satisfied customers. We are making special weaves, seams and edges for all paper making purposes.

you should advertise in

PAPER

the trade journal devoted exclusively to the manufacture, sale and use of pulp and paper Published by

Hughes Publishing Co., Inc.,
1478 Broadway, New York

Paper Testing Methods (1922)

A large edition of this handbook for paper mill laboratories was exhausted shortly after the type had been distributed. In view of the insistent demand the Technical Association has arranged for a republication and *Paper Testing Methods* is again available at $3 per copy.

The work covers detailed procedure for microscopical analysis, physical testing and chemical analysis of the paper with descriptions of the apparatus employed.

It is the only complete and up-to-date handbook on paper testing published in the English language.

It should be in the hands of every paper manufacturer and paper dealer as well as concerns who are large users of paper.

Hamilton Board Felts

OUR style No. 82 top felt and style No. 87 bottom felt have the bulk of the filling threads on the face of the fabric. This style of weave causes the felts to give a smoother finish and longer service than can be secured from plain weave board felts, besides shedding the water better. They do not "roll on the edge" and are billed at the same list and pound prices as are our plain board felts.

PAPER

February 21, 1924

The Magazine of the Paper Industry

THOMAS J. KEENAN, F.C.S., Technical Editor
RUSSELL C. HUGHES, Publisher
ISMAR GINSBERG, B.S., Contributing Editor

A Few Stray Thoughts

FRANKLY stated opinions expressed to PAPER have disclosed that the paper industry wants more than a stereotyped presentation of just news. So PAPER will institute next week a Finance Page. What it will amount to depends upon how it is received.

It will be a page that will interest those heavy browed men who stand back of the paper mill and the industry, those chaps whose word is law and before whom everybody and everything quails. Not that PAPER is going to turn into a financial magazine. Far from it. But it will try to have something to interest another group of paper men.

Stewart Tuttle & Company, 120 Broadway, New York, a newly formed firm which will specialize in paper securities, will furnish the late market quotations. The principals of this company have long been identified with the manufacturing end of paper.

This is just another step ahead for PAPER.

* * *

The *Pulp and Paper Magazine* of Canada takes a definite and emphatic stand on the Canadian embargo matter.

This Canadian publication looks at the matter this way:

> "If you look at the matter from the point of view of a Canadian citizen, and that is the only way that Canadians should look at the question, there is but one answer; there should be an embargo. A study of the economic situation of the Dominion of Canada shows a very serious condition. The country needs population and the population must be supported primarily by home markets. Everyone must purchase some share of what every other Canadian produces. The larger this share the more prosperous the Community. Foreign goods are brought into Canada at a higher rate than Canadian-made goods are exported in exchange. To increase the tariff against imports will go only part way in solving the problem. A higher duty will shut out a proportionate amount of imported materials, but this can only increase the home market for domestic production to the extent that foreign goods are excluded and will not materially increase the employment in the production of the increase in domestic commodities thus absorbed.
>
> "On the other hand any measure which will definitely increase Canada's manufacturing population will definitely increase the home market for domestic production in every other line. There is no field so rich in promise of success toward this end as the more complete manufacture in Canada of Canadian produced raw materials to the condition of a finished product for which there is practically an insatiable demand in the export market."

And that is arguing bluntly and plainly.

* * *

The technical man will find much of humor in the article by Louis Wise in this issue. He discusses nomenclature with an acumen that touches the soul of the man who wants and likes correctness. But not only is there humor, but there also is wisdom. We advise you to read it by all means.

* * *

Last week we promised a review of R. S. Kellogg's new book. It is here. Mr. Keenan has gone into it with a searching, comprehensive view.

* * *

There is also much wisdom in the other articles in this issue. Read them.

* * *

Have you signed that contract for space at the Paper Industries Exposition? Eventually you will, why not now?

Have you planned to be present at the convention? It is less than two months until the convention and exposition. It is high time to be laying plans for the biggest week the paper industry ever had.

* * *

The yielding of bad times before the onslaught of good times as mentioned last week, continues. As yet this yielding isn't tremendous, but it is noticeable. The tide has turned and that is something. It won't be long before this same tide will be creeping up and up to high water mark.

The chap who is ready will gain the most.

The Power of an Obsolete Nomenclature

Authority Makes a Plain Statement Regarding Frequent Errors in Technical Terms

By LOUIS E. WISE

New York State College of Forestry at Syracuse University, Syracuse, N. Y.

In this discussion of what he terms an "obsolete nomenclature," Professor Wise pokes fun at some of the notions entertained by paper technologists and other workers in paper pulp or cellulose concerning the nature of the changes which take place in cellulose under different treatments. The paper was originally read before the Cellulose Division of the American Chemical Society at the New Haven meeting in 1923, and has been contributed by the author for publication in PAPER.

THE triumvirate of terms, cellulose hydrate, hydrocellulose and oxycellulose, has always held a strange fascination for the technologist of the cellulose industries. The pulp and paper mill chemist thinks in terms of sufficiently or insufficiently "hydrated" stock. The manufacturer of textiles, and the paper technologist, as well as the laundryman (and the victimized consumer) have had to guard against the formation of "oxycellulose," whether this oxycellulose be formed as a result of over-bleaching, ing, rust-stains, or the use of chromates in printing calico. The term "hydrocellulose" for years has been a convenient pigeonhole, in which to file numberless products formed by the hydrolyzing action of weak and strong acids on the cellulose of cotton and wood. Not infrequently "hydrated" and "hydrocellulose" have been confused, and oxy and hydrocellulose have been confounded. All of these terms have their element of respectability and apparently all of them insist on remaining in our chemical vocabulary, in spite of the haze which surrounds them. All of them form a very convenient fog behind which the cellulose chemist is able to hide his gross ignorance of fundamental data; a fog which is being very slowly and painfully dissipated.

"Hydrated" Cellulose

It is common knowledge that cellulose, no matter what its source, behaves characteristically under certain treatments. In concentrated solutions of alkalies, it swells and shrinks, and after the alkali has been washed out, it no longer enjoys its original properties. In the parlance of the chemist it has been "hydrated." If the technologist has taken pains to prevent shrinkage during the process, the chemist modifies his term and says that the cellulose has been "mercerized." If the cellulose is mechanically beaten in a "beater" or tumbled about in a ball-mill in the presence of water—it also becomes "hydrated." If it is treated with certain peptizing agents like cuprammonium, or alkali followed by carbon bisulfide, or potassium thiocyanate, a hydrosol is formed, and when by the use of suitable reagents this hydrosol is converted into a hydrogel, "hydrated" cellulose again results. If the cellulose is treated with certain acids, and is "swollen" by them, the product after removal of acid is once more "hydrated" cellulose. If the acids peptize the cellulose, and the latter is immediately precipitated out of solution, again we have "hydrated" cellulose. (In this latter case, however, we tread on controversial ground. Cellulose chemists may contend that the term hydrated-hydrocellulose should have been used. So be it!) The tremendous industrial significance of "swollen" (hydrated) cellulose has recently been ably discussed by Schwalbe (1).

The wide use of the term "hydrated cellulose" forces us to examine it critically. All "hydrated celluloses," no matter whether they have been beaten or mercerized into existence have certain traits in common.

1. When air dry they retain more water than did the cellulose from which they were obtained. There is no real experimental evidence, however, that a definite relation exists between the cellulose and the water.
2. They are all less resistant to hydrolysis than was the original cellulose from which they emanated. Interpreted quantitively this means that their rate of hydrolysis under standard conditions is higher than that of cellulose.
3. In general they are less resistant to chemical attack or to the action of peptizing agents, than is the original cellulose.
4. They are more adsorptive of dyestuffs than are the celluloses from which they were obtained, and they give different and more permanent colorations with staining solutions (like iodine solutions) from those given by cellulose itself.
5. When anhydrous, they have (very nearly) the same percentage composition (C, H, and O) as had the original cellulose, and they often show no greater reducing action towards Fehling solution than did the cellulose from which they are derived.

If we assume that the cellulose fiber is made up of an aggregate of cellulose units (2) and that the units are held together through the agency of residual valence, then all the properties of "hydrated" cellulose point to one direction, namely, that these cellulose *units* remain intact but are more widely separated from one another than in the original cellulose. They, therefore, present a greater surface area and are more adsorptive and more easily attacked by those reagents which destroy or dissolve cellulose. [Figs. 1 (A and B)].

The term cellulose hydrate is apparently a misnomer. Various substitutions in name might be proposed: "Dispersed" cellulose, cellulose hydrogel, "swollen cellulose," gelatinized cellulose, are all possibilities, but the term "hydrate" will probably persist, just as our obsolete term carbohydrate persists. There is really no harm in an obsolete term if we have a stranglehold on its true meaning and when we are not ensnared by its deceptions and take it too literally. "Cellulose hydrate" then, refers to no definite compound between cellulose and water. It refers to no product of hydrolysis. It involves a colloidal phenomenon and should be put in its place.

Hydrocellulose

If cellulose, from any source in any industrial operation has been treated with an acid (or a salt readily hydrolyed to yield a strong acid) and this acid is adsorbed on the cellulose fiber, and the fiber dried, we have what is termed in the vernacular, "hydrocellulose." The substance thus obtained is brittle and easily pulverized, has decided reducing action (Fehling solution), is more or less soluble in alkali, is much less hygroscopic than the original cellulose, and is evidently the result of a more or less extensive hydrolysis. Besides the properties mentioned above, hydrocellulose yields acetic acid when heated with alkali under pressure and forms saccharic and oxalic acids on oxidation. Since, however, cellulose itself under similar treatments yields acetic acid and oxalic acid, and since saccharic acid is a product of glucose oxidation, and glucose is formed by hydrolysis of cellulose, these chemical properties of "hydrocellulose" are not very noteworthy or characteristic.

The claim has frequently been made that hydrocellulose contains one molecule of water *more* than does cellulose and that this water is chemically combined with the cellulose. Analysis of the "hydrocellulose" obtained by various investigation hardly supports this viewpoint.

Thus Girard (3) finds a hydrocellulose $(C_6H_{10}O_5)_2H_2O$; Ost (4) and his coworkers a hydrocellulose $(C_6H_{10}O_5)_6$

H_2O; Buettner and Neumann (5) a hydrocellulose $(C_6H_{10}O_5)_8H_2O$. Perhaps there are still other hydrocelluloses. The composition of hydrocellulose varies with the technic of preparation. A definite homogeneous compound that we can term "hydrocellulose" after applying even the roughest criteria for homogeneity, still remains to be made.

Nearly all of the so-called hydrocelluloses can be readily separated into at least two fractions—one, alkali soluble, and the other insoluble. The insoluble material appears to be nothing more or less than mercerized cellulose (hydrated, dispersed, swollen.) The alkali appears to have removed the "reducing substances of the crude hydrocellulose.

Nettœfel (6) suggests that in hydrocellulose formation from the seed hair of the cotton plant, the surface of the cellulose wall is partly hydrolyzed and that the hydrolyzed material is retained by adsorption on the cellulose. Since such material is retained by adsorption on the cellulose. Since such material is alkali soluble, the residue after treatment with alkali is unchanged (or at most physically changed) cellulose. Heuser's *Cellulosechemie*, p. 117, indicates this diagrammatically. A similar picture is obtained by using the "cellulose unit" hypothesis. (Fig. II). Here the partly hydrolyzed units are still vicimal to the unchanged units (being held in the aggregate by secondary valence, but are themselves mechanically weaker, and cause weakening of the entire cellulose aggregate (wall).

Just prior to the death of Knoevenagel (7) he and Busch reinvestigated the hydrocellulose question. They found that if viscose (itself a cellulose hydrogel) were subjected to the action of HCl gas, a substance was obtained which was completely soluble in 10% NaOH and which according to Heuser and von Neuenstein (8) *may* be a homogeneous derivative of cellulose; the pure "hydrocellulose" so eagerly sought by the chemists. Their criteria for purity and their analytical data, however, leave much to be desired, and "hydrocellulose" still remains the conveniently indefinite expression of the industrialist.

Products which result in part from hydrolysis and in part from the swelling of cellulose and which some wags have jocularly termed "hydrohydrated" celluloses are legion. Hydrated celluloses have low copper numbers and high hydrolysis differences. Hydrocelluloses have high copper numbers and low hydrolysis differences. Between these extremes lie the half-breeds referred to above. The most important ones are the so-called "cellodextrins." They are formed in the production of parchment paper by the partial peptization and hydrolysis of cellulose by H_2SO_4. In the case of *parchmentized celluloses,* the swollen or gelatinized surface character, coupled with an appreciable copper number and a high hydrolysis difference indicate that they are both hydrated and hydrolyzed. Copper numbers: 4.9 to 7.1. Hydrolysis differences:—10.5 to 10.8; (9).

Fleschigs Amyloid represents a much farther stage of hydrolysis since it has a copper number of 18.3, and a hydrolysis difference of 8.3. *Guignet cellulose* (10) still remains an unexplained phenomenon. It is prepared by treatment of cotton with H_2SO_4 (50 Be) and subsequently with water. The mass is washed with water by decantation or dialysis and the final product is readily peptized by water even after drying. Guignet claimed that this material had no copper number, but this is disputed by Schulz (10), who showed that the copper number of *his* preparation was 10.7 and *3.5 higher than the hydrolysis difference.* This indicated a *negative* hydrolysis difference. Guignet cellulose solutions represent typical emsulsoid sols, precipitated by salts, acids and by alcohol. The hydrogel thus

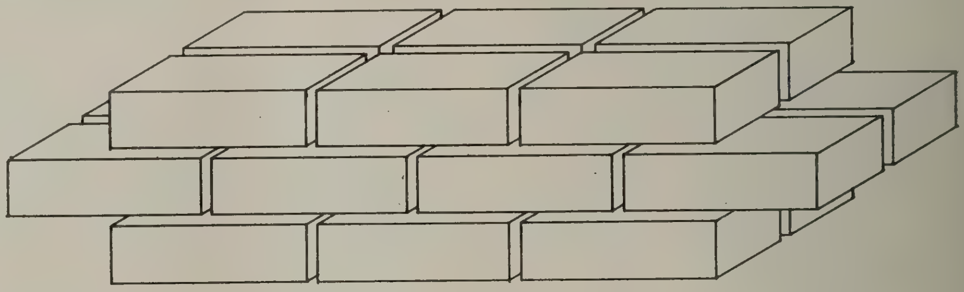

Figure 1 (A)

Original cellulose aggregate. Secondary valences undisturbed

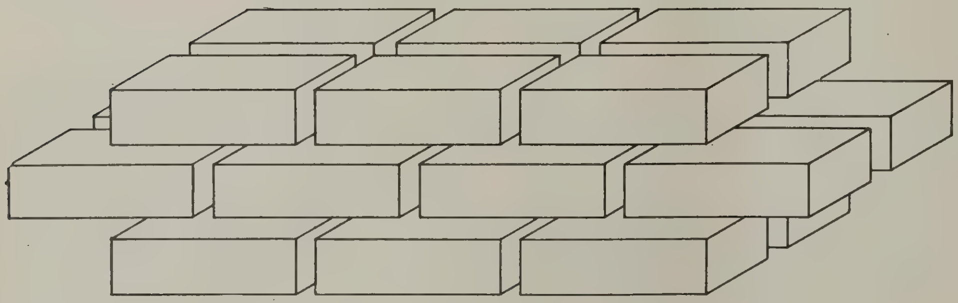

Figure 1 (B)

"Hydrated" or swollen cellulose. Secondary valences disturbed. Cellulose units apart, exposing greater surface and favoring adsorption

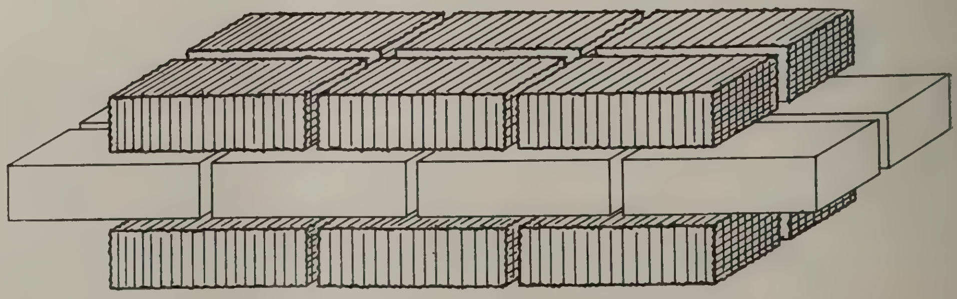

Figure 2

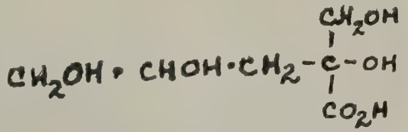
Diagrammatic picture of "hydrocellulose" (or oxycellulose). The shaded cellulose units have been partly hydrolyzed (or oxidized) but are still held to unchanged cellulose units through the medium of partial valence. The entire aggregate is thus weakened formed is converted readily to hydrosol, even after long drying. When Guignet cellulose is treated further with concentrated sulphuric acid it changes materially. Both copper numbers and hydrolysis differences increase and a positive hydrolysis difference is manifested (10).

Oxycellulose

Perhaps the most attenuated term of the hazy triumvirate is that of *oxycellulose.* In general oxycellulose results from the partial oxidation of any cellulosic material. Since many of the oxidizing substances are acid, not only oxidation but partial hydrolysis may take place. Needless to say "hydration" may also take place prior to oxidation. How anyone can assume oxycellulse to be a homogeneous substance remains a mystery. Fortunately modern textbooks (11) and all recent articles on oxycellulose indicate that few investigators hold to this old view.

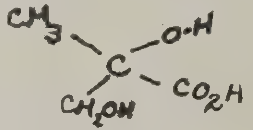
Superficially the "oxycelluloses" resemble the hydrocelluloses. They are brittle substances having a very appreciable reducing action, (Heuser reports copper numbers ranging from 7 to 22) partly soluble in alkali (often with a canary yellow color). However the oxidized celluloses appear to adsorb the *basic dyestuffs.* This coupled with certain other reactions make it appear that the oxycelluloses have acidic properties.

Another reaction of the oxycelluloses that has caused much speculation is the formation of isosaccharinic acid (12): when the oxycellulose is treated with lime. Hitherto isosaccharinic acid has been obtained only from milk-sugar (hydrolysis of which yields galactose and glucose) and the formation of products from oxycellulse remains to be explained. At all events the work should be repeated and the acid reidentified, since Tollen's work is not entirely conclusive, as the identity of isosaccharinic acid has not been fully proved.



$CH_2OH\cdot CHOH\cdot CH_2-\overset{CH_2OH}{\underset{CO_2H}{C}}-OH$

Isosaccharinic Acid



Dihydroxybutyria Acid

Certain characteristics of oxidized cellulose are quite different from those of hydrocellulose. Most oxycelluloses yield furfural when treated with dilute HCl. This reaction so characteristic of the pentosans is not given by cellulose itself (except to a very slight extent.) It has been found that those oxycelluloses which have been prepared by the use of *acid* oxidizing agents yield appreciable quantities of furfural (2 to 8%). This phenomenon may depend upon the formation of an *acid* (by oxidation of a primary alcoholic OH group) and the subsequent hydrolysis of the cellulose units to glucuronic acid. (13)

Taking Irvine's grouping as characteristic of a part of the cellulose molecule; the reaction may be as follows:—

This hypothesis, outlined by Heuser has been further strengthened by his recent work with Stockigt (14) who found that by treating oxycellulose with HCl, CO_2 as well as furfural was formed. Under similar conditions purified cellulose yielded only traces of CO_2. Cotton cellulose, unbleached pulp and hydrocellulose yielded no more than CO_2 than was obtained in the blank determination. Oxycellulose indicated from 0.8 to 2.0% CO_2.

Evidently the furfural reaction coupled with CO_2 generation serves to distinguish partly oxidized from merely partly hydrolyzed cellulose. The latter (like glucose) when treated with HCl may yield *hydroxymethyl furfural* and finally levulinic and formic acids, but would not yield furfural, or CO_2.

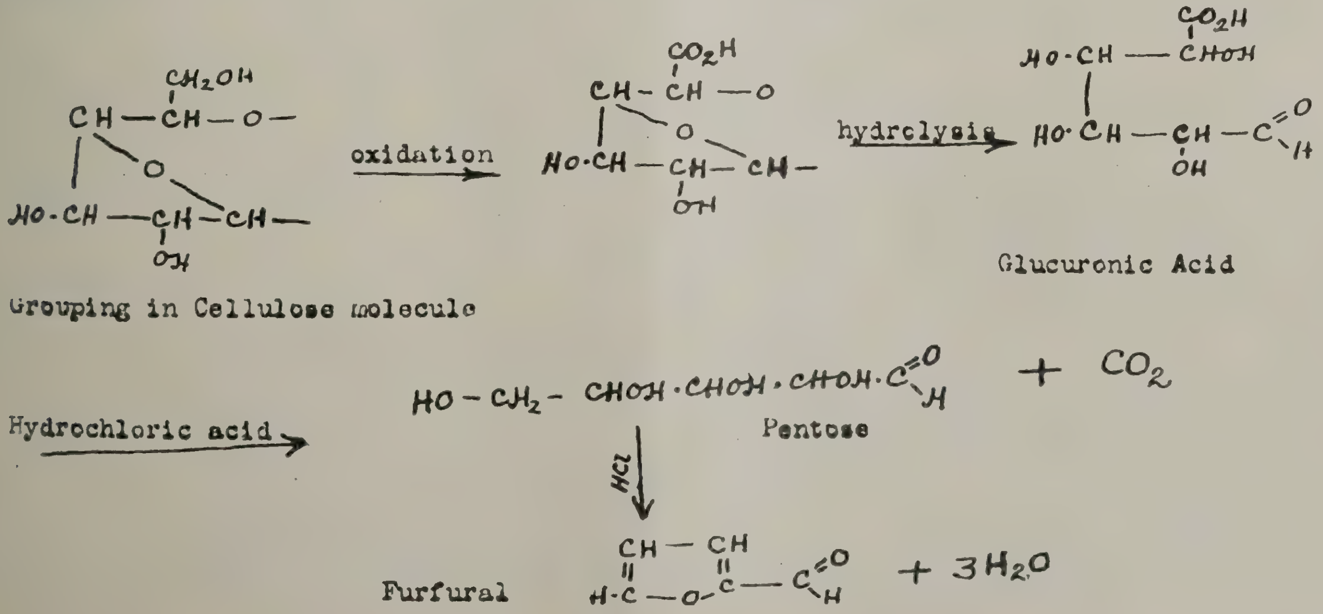
The hydroxymethyl furfural phloroglucide is alcohol soluble and can thus be separated and distinguished from the true furfural phloroglucide, obtained from the oxidized cellulose (or the pentosans).

It is evident then that by quantitative determinations (CO_2 and furfural) we are able to gain some knowledge of the history of the cellulose derivative.

If oxycellulose is treated with dilute acid the residue which remains is partly hydrolyzed cellulose which when subjected to further hydrolysis give yields of glucose practically identical with those obtained from cellulose itself, treated similarly (over 10% higher than the glucose yields obtained from the original oxycellulose).

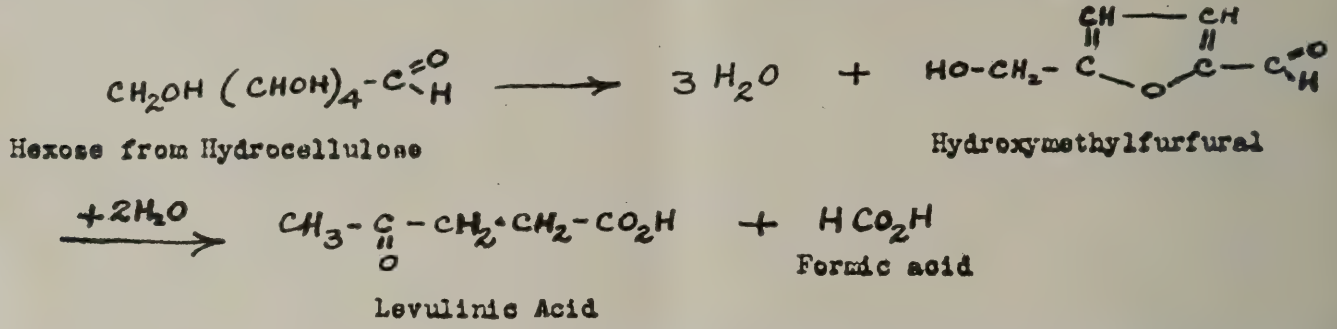
One word more. So called total cellulose determinations instituted by the Cross and Bevan method are usually used in the estimation of cellulose. The longer chlorinations are continued in this method the less alpha and the more beta and gamma cellulose we obtain.

Is it not reasonable to assume that we may be obtaining oxidized and hydrolyzed celluloses in this process, and that beta-cellulose is in fact a partly oxidized product, and gramma-cellulose perhaps a completely hydrolyzed or oxidized product. Here again we have a collection of derelicts in nomenclature—the alpha, beta, and gamma aggre-



gation being old, respectable and thoroughly decrepit. The sooner we recognize that beta and gamma cellulose are convenient terms but that they do not represent chemical entities or have a bearing on the constitution of cellulose, the better. In fact all of the terms: hydrate, hydrocellulose and oxycellulose refer to the past history of the cellulose involved. They are broadly description terms, which become meaningless when stretched to cover actual properties of mixtures deliberately or inadvertantly obtained in the varied industries utilizing cellulose.

(Continued on page 11)



Notes of the New York Trade

Harold Svenson, of 120 Broadway, New York, has issued an announcement that the Holmens Bruk Paper Mills at Norrkoping, Sweden, having terminated its agency agreement with the Newsprint Paper Corporation, of New York, he will henceforth represent this print paper manufacturing organization as agent in the United States. Mr. Svenson has handled Holmens Bruk newsprint in this country for the past three years, the last part as representative of the Newsprint Paper Corporation, and some of the largest newspapers in the United States have used this newsprint and found its quality fully equal to the best American and Canadian print paper. The present capacity of the Holmens Bruk mill is about 70,000 tons per annum. The mill is equipped with all the latest improvements in newsprint manufacturing and has studied the requirements of the American market closely. The mill is situated on tidewater, making it possible to load on ships from its own wharves, thus eliminating all handling on the other side.

* * *

The Sutphin Paper Company, Inc., of which Herman Wunderlich is treasurer, paper jobbers of 439 Lafayette street, New York, has been elected to membership in the Merchants' Association of New York.

* * *

The Canadian Export Paper Company, Ltd., of Montreal, has leased offices in the Park-Lexington Building for its New York executive headquarters.

* * *

Frank Branscombe has severed his connection with Gosling & Farr, Inc., box board dealers of 141 Wooster street, New York, of which concern he was secretary, and is now associated with Charles M. Mead in the New York office of the Philadelphia Paper Manufacturing Company, of Manayunk, Pa., at 110 East Forty-Second Street. Mr. Branscombe will assist Mr. Mead in marketing the Philadelphia Company's box board in New York and New Jersey.

* * *

William F. Farren, hitherto connected with several prominent paper stock concern in New York and Brooklyn and well known in the trade, is now with William Steck & Company, of 13 Park Row, New York, dealers in papermakers' supplies of all kinds.

* * *

Don A. Fisher, son of Samuel J. Fisher and associated with his father in the firm of S. J. Fisher, Inc., dealers in paper manufacturers' supplies of 309 Water street, New York, has returned from a honeymoon trip to the South. Mr. Fisher was married recently to Miss Betty Palmer, the wedding taking place in the home of the bride's parents in Brooklyn.

* * *

The domestic and export machinery and paper mill supply business conducted by the late H. B. Wadsworth at 51 East Forty-second street, New York, will continue to be operated by his widow, Mrs. Jessie B. Wadsworth, under the firm name of H. B. Wadsworth, Inc. Mrs. Wadsworth is thoroughly familiar with the paper and pulp trade as for over seven years she handled all the office details of her husband's business and traveled considerably among the mills during this period. Associated with Mrs. Wadsworth in conducting the business is C. W. Quinn, who is well known in the industry through his former connections with the Craig-Becker Company, Inc., and R. F. Hammond, Inc.

* * *

Edgar Rickard, president of the Pejepscot Paper Company, has returned to New York after spending a few days at the company's mills in Brunswick, Me. Regarding changes which have taken place in the local management, Mr. Rickard stated that, having completed the first unit in a plan for rebuilding the equipment, F. C. Clark has retired as resident manager, and that the regular staff will carry on the operations. Charles Dickinson, general superintendent for the last 30 years, will have charge of the operating department, and E. S. Catlin, for the last three years chief assistant in the administrative branch, will act as direct administrative representative of the president and the board of directors. The R. B. Wolf Company will confine its connection with the company to such work as it may be called on to perform as consulting engineers, but will not perform any service in the adminstrative functions of the company.

* * *

Elysee Arie, a specialist with a broad knowledge of imported fancy papers and formerly with the fancy paper manufacturing firm of Keller, Dorrian-Silvian, of Lyons, France, is now a member of the sales staff of the Whiting-Patterson Paper Company, of 265 Canal street, New York. Mr. Arie will act as road representative of the company under the direction of William B. Pitts, manager of the imported paper department of the concern.

* * *

Charles B. Foster, for the last year and a half in the sales department of the Pejepscot Paper Company, of Brunswick, Me., has severed his connection with that concern and is now associated with the Carpenter Container Corporation, of 1 Broadway, New York. Mr. Foster is widely known in the paper industry, partly through the excellent work he performed for the period he served as assistant general sales manager of the American Writing Paper Company, of Holyoke, Mass., and also through his connection with the Pejepscot Paper Company, for which firm he was in charge of sales in the New England territory. In his new connection Mr. Foster will have an active part in the development of the Carpenter Container Corporation.

* * *

The Beekman Paper and Card Company, of New York, has been appointed agents in this territory for the Relyon line of proofing papers manufactured by the McLaurin-Jones Company at its coating mill in Ware, Mass. This paper is coated on one side for the especial purpose of engravers in proving up their plates. Miss Ruth E. Bracker has been put in charge by the Beekman Paper and Card Company of this new line.

* * *

The Canfield Paper Company, paper jobbers and mill agents of 62 Duane Street, New York, announces that it has opened a paper testing laboratory and is now prepared to furnish accurate information regarding the ream weight of any paper from a sample as small as an inch square, and, from larger samples, the bursting strength and tensile strength, amount of loading, amount of coating, nature of contents, and similar information. The service is provided free to the firm's customers.

Lindenmeyr's Get Estate

The will of Gustave Lindenmeyr, for thirty years President of Henry Lindenmeyr & Sons, 32 Bleecker Street, New York City, leaves 1,000 shares of the capital stock in the paper firm, all personal effects and $100,000 to his to his wife, Elsa J. Henry Lindenmeyr, a nephew, and Mary A. Lindenmeyr, a niece, receive $10,000 and $5,000 respectively.

The will, filed for probate in the Surrogate's Court recently by Bean, Callender & Cullen, 45 Wall Street, bears the date February. 14, 1922. Howard W. Charles, 325 West End Avenue, and the United States Trust Company are executors. Mr. Lindenmeyr died December 27, 1923.

Processes of Coloring Coated Paper

Varieties of Coated Papers, Their Uses and Forms of Coloring Employed in their Manufacture—An Expert Account of the Pigments and Dyes Used

By NORMAN CLARK
*A. M. Collins Manufacturing Company,
Philadelphia, Pa.*

MOST OF US are familiar with coated paper as it appears in magazine covers, box covers and the illustrated pages of books. But there are many other uses to which coated paper is put, some of which are probably not so well known as those cited. The more important varieties of coated papers are enumerated below, together with an indication of their uses.

1—*Friction* and *Flint*. High glazed papers taking their names from the machine on which finished.

2—*Plate*. A flat finished, stack-calendered paper, harder sized than a friction surface, used for labels, signs, kindergarten supplies and box coverings.

3—*Book*. A dull semi-gloss, soft sized paper, used for printing of various kinds.

4—*Litho*. A very hard sized, flat finished paper, used to take the impressions from a lithographic press.

5—*Dial*. A hard sized, well made sheet, used for clock and watch faces.

6—*Playing Card*. The cards as we get them are pasted two to five ply. The outside or liner carries a hard sized coating and is pasted to the usually softer middle, with a flour or starch paste colored black, or red, to render the card opaque.

7—*Brush Enamel*. A very important velvet finish paper, used largely for illustration and box coverings. It is so named because the coating contains a large proportion of satin white and the sheet is subjected to a brushing operation before calendering.

8—*Translucent*. A heavily coated, good quality sheet used principally for embossed work.

9—*Label*. A hard sized clay-coated sheet used for printed labels.

10—*Metal*. This paper is coated with various metals in the powdered form, including bronze, copper, tin, zinc and aluminum. It is stack-calendered or frictioned, plain or embossed and is used principally for embossed labels and box coverings.

11—*Mica*. Fancy box coverings, coated with mica, tinted with aniline dyes, usually printed with a design on an intaglio press and embossed.

12—*Waterproof*. The better grades are double-coated with a hard-sized ground coat and a top coat of shellac, or casein, or a mixture of the two waterproof coatings are usually embossed and are used for high grade box coverings, imitation leathers for suitcases, note book covers, and similar purposes.

13—*Cover Papers*. Consist of fancy coatings combined with embossed effects, used for book and magazine covers, menus, programs, catalogues, etc.

14—*Photo Mounts*. Varied effects produced in minor colors for use by photographers, usually made on a board stock.

Other grades might be mentioned but enough has been said to make the reader acquainted with the great variety of raw stock used and the consequent troubles of the color man. Mills making many grades of fancy papers may use nearly every variety of raw stock from tissue to board.

Theory of Coloring

The coloring of coated paper is different from the coloring of almost any other material, in that the material to which the color is given, namely the paper, is not the material colored. What is done is to color the coating which covers the paper. This coating consists essentially of pigment, size and color. The pigment forms the body of the coating; the size holds it to the sheet and the color gives it the desired appearance. The pigment and the color may consist of several different constituents but the size is nearly always casein, sometimes glue or starch being used.

It can readily be seen that the action of many materials upon the coloring matter must be taken into consideration. For example, basic dyes mix well with clay and are in fact, largely adsorbed up to about 3 per cent concentration, but it is impossible to mix basic dyes with casein, owing to the precipitating action of the size.

There are three principal forms of coloring used in the manufacture of coated paper. They are given in the order of their use:

1. Lake colors or "pulps."
2. Aniline dyes.
3. Colored pigments.

Coloring With Lake Colors

Lake colors or pulps are the products produced by the precipitation of aniline dyes on suitable mediums by metallic salts or bases. The medium or carrier varies with the use for which the lake is intended. The precipitating agent varies with the nature of the particular dyestuffs used, two or more dyestuffs being usually present. The dyestuff varies, of course, with the color desired and the special characteristics which the finished lake must possess. The dyes used most extensively are those of the acid class, barium chloride being used as a precipitant for these dyes. There are acid salts to wash out of the lakes and the color man should know something of lake preparation to understand the changes that take place. For instance, on mixing casein with a lake or pulp, the casein will often coagulate. This may result from a reaction with the salts that are present, which have a decomposing effect on the casein solution. The remedy is to mix the lake with a little ammonia before adding the casein, thus neutralizing any free acid that may be present.

Among the lakes in common use, the following may be noted:

Red—Turkey red, magenta, Persian red, Arabian red, red lake, rose lake, maroon.

Orange—Orange lake, chrome orange.

Yellow—The chromes used are lemon yellow and medium yellow.

Green—Emerald green, silk green, chrome green.

Blue—Blue lake, marine blue.

Violet—Violet lake.

Blacks—Satin black, black lake, friction black.

The reason lakes are preferred to dyestuffs are to be found in their wide applicability and greater ease of handling and use, in addition to the fact that they are dyestuffs not pushed by dye manufacturers in coating mills.

Lake colors may be used alone for deep tones, which is indeed the only way to produce a deep shade, or they may be mixed with clay or other white pigments. Pulps, being insoluble, are all mixible one with the other. Care must be taken, however, to see that they form a homogeneous mixture. For example, the chrome yellows are among the heaviest of the pulps while the blacks, as a class, have the lowest specific gravity. Considerable difficulty would be experienced by combining these two colors in a mix owing to the fact that the black would tend to rise to the surface and the yellow to seek the bottom. This would spoil the uniformity of the coating. The same holds true of many other colors. The color man should have a list before him showing the specific gravity of his colors and indicating what colors may be safely mixed.

Chemically prepared and natural pigments in a pulp form are usually classified with the lakes. The most common are:

Chrome yellows, oranges and greens
Sienna and umber pulps
Ultramarine pulp
Prussian blues.

They are treated in every way as lake colors, though subject to the same objections as noted under pigments, with the exception of the chromes. These are the finest of coating colors of any class.

Coloring With Aniline Dyes

Aniline dyes afford the simplest, and in many cases, the most satisfactory method of coloring the coating. There are certain conditions which must, however, be borne in mind if one desires the best results with this method.

In the first place, the density of the color to be matched must be taken into consideration. Dyes are suitable for light and some medium shades; not for dark shades. The reason is that most dyes, for over a 2 per cent concentration of dyestuff, contain too much free dye, difficult to render fast. To make a dyestuff color fast it is necessary to do one of two things, either form a lake or harden the size so as to make it waterproof. For the first method consult a standard work on lake colors. For the second, with casein size use hexamethyl enamine, and with glue, chrome alum is the most suitable hardening agent.

Secondly, the nature of the mix must be considered. If casein and wax are used both solutions are alkaline. Also if ammonia is used to free out the coating color, the total alkalinity of the mix is comparatively high. Hence, it is impossible to use basic dyes and recourse must be had to the acid or direct dyes. Here again a choice must be made depending on the brightness of the color. If bright, the acid dyes must be used. If flat and rather dull, then direct dyes may be used. Clay seems to have the property of dulling down direct dyes. If it is desired to use basic dyes, one must then use glue as a sizing agent.

Dyestuffs find splendid application in the line of specialties. One of the most useful fields is in tinting the shellac solution used for the top coat of a waterproof: Also in tinting mica coats and in the spatter method of coating where the raw stock or coated sheet is subjected to the spattering of dyestuff solution. Another appreciated application is the blotch method of printing—which is really a coating operation—where cloud effects and fancy designs are produced.

Coloring With Pigments

Because pigments possess the highest fastness properties of any of the coloring matters, they are still used. The most commonly used pigments are those enumerated below, as follows:

Raw and burnt sienna
Raw and burnt umber
Several grades of ocher
Several grades of carbon black
Red and yellow oxide
Ultramarine
Prussian blue
(The chromes have been mentioned under lakes)

With the exception of the chromes, the factor which limits their usefulness is the coarseness and hardness of the individual particles. These particles are not softened in the mixing operation and when subjected to the action of the friction calender, they break up and present a dull surface instead of the high glaze which is usually produced. Some mills successfully grind the pigments in a water suspension with an ink grinder and hold the pigments in a pulp form. In this way the objection to their use is obviated.

Coloring With Natural Organic Colors

Although these colors were much used at one time, they find very little application at present except indirectly. They are still used by the lakemaker and in this way find their use in coloring coated paper. The kinds still used in quantity consist of quercitro, querbracho, logwood, hypernic.

Matching Colors

Much has been written on the matching of colors, especially for textiles, that can be read with profit by the coating color man. Three points are often forgotten which it may be well to emphasize. The first two may be corrected by a single remedy—keep the mix simple.

(1). The color man must bear in mind that it is extremely difficult to mix colors without introducing a graying effect. For instance, take such a simple mixture as green and yellow. If the green needs yellowing, then presumably it is a bluish green. There are very few yellows which have not a touch of red in their make-up. Then we have two graying combinations, the red and green, the blue and yellow. Thus in any combination, we should consider the purity of the colors and if a few moments are taken with a pencil and paper to set down the subsidary tones of the colors we intend mixing, the graying effect will be easily noted and avoided.

(2). Where a medley of colors are used, the likelihood of changes in the final color are greatly enhanced. These changes may be caused by a number of things, but they usually result from chemical reactions taking place between the dyestuffs themselves or between the dyestuffs and some other ingredient of the mix, or to effects from heat used in drying, or to unequal fading. To illustrate this, I recall making a bright green out of patent blue and chinoline yellow. The mixture coated beautifully but when the paper reached the reel, blue stick marks were apparent. To make a long story short, it was found that too great a heat at the beginning of the line affected the yellow, driving it into the sheet at the places the sticks touched, leaving the blue. This trouble showed at the stick because the heat transference from the sticks to the paper was greater than from the air to the paper.

(3). Although all color men may not agree with me, I feel that we should have the mill sheet the same size as the sample to be matched. Seventy-five percent of the samples of paper the color man gets for matching vary from half the size of a postage stamp to a piece about 2 x 2 inches. The color man too often takes a large mill sheet and tries to compare it with the smaller sample. Owing to the large amount of light reflection from the mill sheets and, very often, a different surface, this is obviously bad practice. What should be done is to reduce the mill sheet to an equal size with that of the sample to be matched. A method recommended is to cut a frame out of white flat finished paper having two apertures the size of the sample. Insert the sample and a piece from the mill sheet and compare them. Precaution must be taken about the light used for matching. It should be a north light and contain no colored reflections, as red from a brick wall or green from trees, etc.

Many coating men are now making use of so called hand matching. This is simply preparing the color run in a small way before making up the larger quantity for the tank with hand brushes making a brushout of the weight and on the raw stock required. It is then finished as the order specifies. This method turns out satisfactorily if it is not carried to excess and, a needless amount of time is wasted in getting an absolute match. The hand brushout very seldom agrees with the machine sample. It is useful to carry the method to a point where only minor changes need to be made when the larger quantities of color are mixed.

Standardization of Lake Colors

Anyone who has had much experience with lake colors knows that they vary a great deal in water content. The only square way to deal with this variation is to buy them on a quaranteed solid content. If we take a ton of pulp that is supposed to contain 35 percent solids, amounting to 700 lbs. and the shipment arrives 30 percent solids, there then should be 2333 lbs. in order to fulfil the order. If it is 38 percent then 1842 lbs. will be sufficient. The shipment should be tested both by the manufacturer and the coating mill and adjustments made accordingly.

Standardization of pulps is necessary on account of the gradual drying out of the lake; the effect being that 100 lbs. of pulp this week means 35 lbs. of dry pigment, while next week it may mean 40 lbs. An average barrel of 600 lbs. of pulp when freshly made and barrelled will lose 10 to 30 lbs. after standing two weeks. There are many ways in which standardization may be effected, but one will suffice for an example.

Determine the percentage solids at which a particular pulp is to be maintained (always lower than the percentage at which it is received), empty the contents of a barrel into a mixer. Agitate and determine dry contents, add the necessary water to lower the solids to the standard and empty the contents, after agitation, again into a covered metal container.

Agitate with a paddle each time any of the pulp is used. If the lid is fairly tight the pulp will remain constant for at least two weeks. It is convenient to use the nearest even 5 per cent to the average per cent at which the pulp is received. As an example, suppose the average for Turkey red as received is 33 per cent and the barrel of color weighs 600 lbs. net. Then the dry contents is 198 lbs. If the standard is set at the nearest even 5 per cent then it will be 30 per cent. The final color will weigh 660 lbs. or 60 lbs. of water will have to be added. This method, although somewhat laborious, will be found to repay the pains taken.

BUREAU OF STANDARDS IS BUYING NEW PLANS

Government Department Has Notes of Interest for the Paper Industry

THE following notes of the activities of Bureau of Standards, Department of Commerce, have been compiled in relation to the paper industry.

A new type of tester for determining the bursting strength of paper has been received by the Bureau of Standards, Department of Commerce, and a comparison is being made between this device and the ordinary type in commercial use. In connection with machines of this kind, which employ a pressure gauge to indicate the results, a study is under way of the effect of the weight of the needle on the indications.

Tests of Paper Towels

Various methods of testing folded paper towels have been investigated. Fourteen samples representing the products of nine different manufacturers were used. An attempt was made to develop a method of determining the tensile strength when wet, as it was believed that such a test would approximate service conditions. However, satisfactory results could not be obtained because of the weakness and poor formation of most of the samples. Apparently the bursting strength of the dry paper is the most satisfactory indication of its strength. Its absorbency is satifactorily determined by applying one drop (0.2 cc.) of water to the surface and noting the time for complete absorption. The various samples differed considerably in strength and absorbency.

Studying Window Envelopes

The Bureau is conducting a study of the papers used for the outlook aperture of window envelopes, from the point of view of properties and methods of testing.

The transparency and glaze of these papers are of great importance since both low transparency and high glaze are objectionable. In fact mail clerks handling large numbers of window envelopes have complained of the eye strain produced by certain types.

An attempt is being made to find the most suitable paper for this purpose and to develop test methods which will insure securing this kind of paper in the future.

Compiling Data

The Bureau is making a compilation of data relating to the size of plant fibers suitable for the manufacture of paper. There is a great deal of information of this nature to be found scattered through the literature, and it is believed that if gathered together in convenient form it will be of considerable value to those carrying out fiber investigations.

Demand Relief

Demanding relief for what they regard as unreasonable and discriminatory incerase in freight rates for hauling pulpwood between Maine points a number of pulp and paper concerns have joined in an appeal to the Public Utiilties commission and a hearing on the complaint has been ordered to be held Feb. 28.

The concerns joining in the complaint are the Oxford Paper Co., Rumford; the S. D. Warren Co., Cumberland Mills; Eastern Manufacturing Co., South Brewer; Orono Pulp and Paper Co., Basin Mills; Penobscot Chemical Fibre Co., Great Works; Advance Bag and Paper Co., Howland; Poland Paper Co., Mechanic Falls; Coated Paper Co., Rumford; Nekonegan Paper Co., Old Town; Pine Tree Paper Co., Inc., South Gardiner; Keyes Fibre Co., Shawmut; Skowhegan Paper Co., Skowhegan; Androscoggin Pulp Co., South Windham and Steep Falls; Gilman Paper Co., Gilman, Vt.; and E. M. Frye, Walter S. Wyman and F. D. True, trustees in bankruptcy of the Cushnoc Paper Co. and the Kennebec Co., Augusta.

The complaint is made in connection with the new mileage scale, effective February 4, 1924, and the complainants point out that this rate makes heavy increases and that since April, 1918 there have hitherto been increases of 80 per cent offset only by one ten per cent reduction.

* * *

Going Good Again

All paper machines in the three mills of the Pejepscot Paper Co. are again operating on full time except for Machine No. 1 in Bowdoin mill. This plant and the mills at Lisbon Falls have been closed for several weeks but it is said that the prospect for regular production is now excellent for some time to come.

C. B. Thorne Says:

Riordon Pulp Corporation, Ltd.,
Hawkesbury, Ontario

MY DEAR MR. KEENAN:

I wish to congratulate "PAPER" in having persuaded you to accept the position as Technical Editor.

I also received the copy of PAPER which you forwarded me which I may say looked very well indeed. May I wish you all success.

Whenever I have anything that may be of interest to your paper I certainly shall take advantage and send it to you.

Very truly yours,
RIORDON PULP CORPORATION, Ltd.
C. B. Thorne.

Decayed Wood for Sulphite Pulp

Wood Used in Experimental Work at Forest Products Laboratory to Determine Availability of Rotted Wood for Pulping—Fungi and Insects that Attack Wood

By JOHN D. RUE, R. N. MILLER
and C. J. HUMPHREY
Forest Products Laboratory, Madison, Wis.

At the annual meeting of the Canadian Pulp and Paper Association held in Montreal, January 24, the Technical Section and the Woodlands Section met in joint session for the discussion of this important paper on the utilization of infected wood in the manufacture of news grade of sulphite pulp. The conclusion of the authors is that most rotted woods can be cooked with good results as regards colors and strength. The exceptions are woods that have been softened too greatly or that have been infected by the fungus called Trametes pini, though pulp from wood so infected is not materially weaker than pulp from sound wood. The subject is one of vital importance to all pulp manufacturers and the paper is accordingly one that should be studied carefully.

THE most vital problem confronting the paper industry of this continent is the provision of an adequate and continuous supply of pulpwood. One of the most important factors in this problem is the loss caused by decay, which is on a par with fire in its destruction of wood. The recent devastation by the spruce budworm in Eastern Canada and North-Eastern United States and the Lake States has added to the gravity of the situation because it has been followed by serious decay. The attention of the industry throughout the country is, therefore, very rightly focused on the relation of decay to a supply of wood. Too much emphasis cannot be laid upon the necessity of utilizing even the rotted wood, provided this can be done economically. Equal emphasis should be laid upon the need for every precaution in handling and storing pulpwood to protect it from unnecessary further decay after it leaves the stump. Decay is caused by wood-destroying fungi which feed upon the wood, rendering a portion of it volatile, another portion water soluble, and other portions less resistant to the action of chemicals. Some of these organisms cause destruction chiefly of the cellulose; some, in addition to their action upon the cellulose, also attack the lignin to a greater or less degree; some initiate their attack in the sapwood and others in the heartwood. All of these effects have a vital bearing upon the use of the wood for pulp manufacture. Faull, Schierbeck, and Hawkings have called attention to various diseases and decays in spruce and balsam as found in the forest. The types of decay which these authors have discussed are characteristic and readily distinguishable.

The logging superintendent who is supplying his sulphite mill with wood is confronted with the very practical problem of determining how to select wood which will produce sufficient pulp of a commercial grade to warrant sending it to the mill. He needs to know whether the mill can use wood which is decayed. More than that, he needs to know how badly it may be decayed before it has lost economic value. He should have some method, therefore, of measuring or determining the degree of decay. He should know how the various prevalent types of decay vary in their destruction of the pulping value of the wood. He should know, further, how rapidly the wood will continue to decay under the conditions of transportation and storage to which the wood is subjected before it actually enters the manufacturing processes.

This report deals with some of the results obtained at the U. S. Forest Products Laboratory in a study of a very limited phase of this problem. A preliminary survey has been made of the utility for sulphite pulp of spruce and balsam infected with a few of the most important types of wood-destroying fungi. The study has so far been limited to the determination of the utility of the wood as found. The effect of transportation and storage on utility is a matter of vital importance which must receive attention as opportunity permits.

Through the courtesy of Price Brothers, Ltd., and the Laurentide Company, Ltd., the wood studied was supplied gratuitously from the limits of Price Brothers near Lake Kenogami, Quebec. The wood was selected by a forest pathologist representing the Laurentide Company, Ltd., and Price Brothers, Ltd., working in conjunction with a pathologist from the U. S. Forest Products Laboratory.

The wood selected, represented (1) sound balsam, (2) balsam infected with the fungi, *Fomes pinicola Polystictus abietinus,* a mixture of several species of fungi referred to as mixed feather rots, and a particular type of fungus resulting in a decay which has heretofore gone under the name of "hemlock heart rot," and (3) spruce infected with *Trametes pini.* A sample of sound spruce from Minnesota, was also included in the investigation for purposes of comparison.

The name "hemlock heart rot" is inappropriate, and a more suitable one should be selected. So far as known, it is not an important decay of hemlock. Studies of the organisms producing this type of decay and the feather rots are under way by Dr. Faull of the University of Toronto.

Areas of balsam and spruce killed by the budworm, or other agencies, are particularly subject to infection from several of the fungi represented, particularly *Fomes pinicola* and *Polystictus abietinus.* The fungus of "hemlock heart rot," besides producing a heart rot in living trees, also causes an important sap rot in dead balsam timber. When developing in a living tree it may occur at any point on the trunk, although but rarely in the butt. *Trametes pini,* while primarily a heart rot in living spruce, can also rot the sap-wood of dead timber. The feather rots are principally confined to the heartwood and usually start at the center of the trunk, enlarging the area of infection as they develop. They usually enter the trees through the roots and cause butt rots.

The rots due to *Fomes pinicola* and *Polystictus abietinus* are somewhat darker than the normal wood and in advanced stages make the wood soft and easily crumbled. The "hemlock heart rot" is accompanied by a decided reddening or browning of the affected wood and a progressive softening of its structure until in the last stages the wood becomes very soft, and stringy rather than crumbly. The feather rots in an advanced stage cause a disintegration of the center of the log into flattened strips and slivers of softened wood, which gradually fall away, leaving a hollow in the log. Around the slivered center a darkened area is found; in the earlier stages of infection this darkened area may be the only easily discernable characteristic.

Trametes pini is easily recognized by a brown and white speckled appearance of the cut end of the log, caused by the presence of pockets which are lined with the bleached wood fiber. With this fungus the softening of the wood structure in the living tree is not so apparent in advanced stages as in the case of the other species studied.

All the fungi represented are prevalent in the balsam and spruce forests of Eastern Canada. The percentage of infection of any given fungus may vary widely for different localities, but they can all be found to some extent in any of the regions investigated. On any large operation in living timber the feather rots and "hemlock heart rot" are bound to be well represented and of great economic importance. If the forests contain a considerable proportion of unthrifty spruce, *Trametes pini* may prevail, while in forests with much timber dead for two to three years or more such fungi as *Fomes pinicola* and *Polystictus abietinus* become common and very destructive.

There are several other important rots in the region investigated, the physical characteristics of which do not differ essentially from the types above indicated. They may therefore be expected to have similar effects upon the pulping value of wood infected with them.

So far as is known, "hemlock heart rot" is not prevalent in the United States. The other species will probably all be found extensively represented in northern forests in the United States as well as in Canada, and will probably be equally destructive in both countries.

All the material taken from the woods for experiment was graded by the pathologists before shipment. Based on the apparent degree of firmness the different samples would rank as follows, beginning with the least softened: sound wood, "hemlock heart rot" grade 1, "hemlock heart rot" grade 2, *Trametes pini* rot in spruce, mixed feather rots, sap rot due to *Polystictus abietinus* "hemlock heart rot" grade 3, and friable sap and heart rot of *Fomes pinicola.*

With the exception of "hemlock heart rot" grade 1, the experimental logs would, under present logging practices in this region be considered unsuitable for pulp and probably would be culled by the scaler and left in the woods.

Preparation of the Wood for Pulping

The wood was received at the Laboratory in the form of 4-foot bolts. Representative portions of each type or grade of rot were selected for cooking and were barked by hand with draw knives. In the case of the sap-rotted specimens, care was taken to remove only the bark. A cross-sectional disc was removed from the middle of each barked bolt, and the discs were photographed.

Table 1.—PHYSICAL PROPERTIES OF WOODS AND YIELDS OF PULP

Samples for each species listed in order of decreasing firmness of the wood. Yield figures are averages for two cooks.

BALSAM

Sample No.	Fungus	Volume of discolored wood Percent	Weight per cubic foot of wood Pounds	Yield of oven dry screened pulp Percent	Yield of oven dry screenings Percent	Total of pulp yield per 100 cubic foot of wood Pounds
975-0	None	None	20.8	49.6	0.8	1048
975-3	"Hemlock heart rot" grade 1	55	21.0	51.0	0.9	1085
975-4	"Hemlock heart rot" grade 2	74	21.1	48.9	1.2	1057
975-1	Mixed feather rots	31	21.0	50.6	0.9	1082
975-6	Polystictus abietinus	66	17.8	49.1	1.5	900
975-5	"Hemlock heart rot" grade 3	100	16.6	45.6	1.3	785
975-2	Fomes pinicola	69	18.0	40.0	0.6	733
			SPRUCE			
963	None	None	26.2	45.7	1.7	1240
975-7	Trametes pini	96	22.3	51.1	0.7	1153

The measurement of the amount of rot was based upon the outline of discoloration visible to the unaided eye on the freshly exposed cross sections. Tracings of the discolored and the total areas of the freshly cut center sections were made on tissue paper. The volume of the sound and the infected wood in each bolt was calculated from these areas, measured with a planimeter, and from the length of the bolt. This calculation is based upon the assumption that the discolored portion was uniformly disposed through the bolt, an assumption justified by an examination of several of the bolts after splitting. The error in these volume measurements is perhaps + 5 per cent.

The various portions of wood were weighed and chipped, the thoroughly mixed chips were sampled for moisture, and the weight of the dry wood per cubic foot was calculated on the basis of the volume obtained as indicated above. A portion of chips was taken from each sample for chemical analysis.

The chips were not screened before cooking but the knots were picked out by hand. The yields obtained in this way, therefore, show the losses that take place in the cooking operation when the wood is cooked in its entirety.

Conditions of Pulping

The same volume of chips was used in each cook. The variation in the weight of the chips together with the need for keeping the digester filled with liquor, prevented the maintenance of a fixed ration of acid to wood. In all cases 50 gallons of acid were used and the digester was filled with chips.

The acid used was made up from high grade calcium lime and liquid sulphur dioxide to a strength of 5.00 per cent total—3.80 per cent free and 1.20 per cent combined sulphur dioxide.

Discussions of Pulping Data

The yields obtained from the various samples of infected wood, together with those obtained by way of comparison from sound spruce and balsam, are shown in Table 1.

The sample of wood infected with *Polystictus abietinus* gave a normal yield on the weight basis, but, owing to a marked decrease in the density of the wood, the yield on a volume basis is somewhat below normal. These samples infected with "hemlock heart rot" and *Fomes pinicola* gave yields which on both the weight and the volume bases are below normal. The yield from the wood infected with *Trametes pini* was higher, on the weight basis, than that from sound wood. This fact is in accord with observations made by Johnsen and Lee and is not surprising in view of the comparatively high cellulose content of the decayed sample. (See Table 3.) The density of the decayed wood was, however, sufficiently lower than that of the sound wood to show a reduction of yield on the volume basis.

When considering the yields obtained it must be remembered that in these cooks all the wood except the knots was cooked. In the usual mill operation, however, some of the weakened portions of the wood will be mechanically disintegrated and lost. Wood containing sap rot will suffer a loss when passing through the barking drums. Wood containing either sap or heart rot or both will suffer a further loss in friable material in chipping and screening. The tendency will be, therefore, to increase the proportion of sound wood that goes into the digesters, and to throw the loss on the wood room operation rather than on the cooking operation. In mill operation, in comparison with the results, obtained in this investigation, the final effect will be lower yields per cord, little or no change in the yields per digester, and better quality of pulp because of the greater proportion of sound wood reaching the digesters.

Strength of Pulps

The strength tests on the pulps, results of which are given in Table 2, are very encouraging. In the unbeaten state (20 minutes in the ball mill to open them up) the pulps from the decayed woods show a strength which, with the exception of that from *Trametes pini,* is not appreciably lower than that of pulp from sound wood. The strength of the pulp from *Trametes pini* was not so far below that of normal commercial pulps as to preclude its satisfactory use for newsprint. The behavior on beating, however, was different, inasmuch as the pulps from the decayed woods hydrated rapidly to a parchment, the strength reached a maximum quickly and fell off rather rapidly.

In the manufacture of newsprint, however, beaters are rapidly being displaced by mixers, consequently, the initial strength of the pulp is of more importance than the strength that can be developed with hydration.

Color of the Pulps

The chief objection to the pulps made from the infected wood is to be found in their poorer color. This darkening was roughly proportional to the degree of discoloration of the wood, but in no case was the color worse than that of hemlock sulphite used regularly in middle western news mills.

The measure of the practical utility of a bolt of pulpwood is the yield and quality of the pulp that can be obtaned from it.

Firmness of the Wood

From a study of Table I, in which the samples are listed in the order of the decreasing firmness of the wood, there is evident some parallelism between decrease in firmness and decrease in yield; the greatest loss in yield is obtained from the wood which shows the greatest loss in firmness. Had the wood been prepared under mill conditions still greater reduction in yield would doubtless have occurred, as already pointed out, because of the mechanical losses incident to wood room operations.

No accurate method is now available to measure and record the degree of firmness of the wood. The parallelism between this property and the yield indicates the need for the development of some simple method of measurement which can be used to aid the scalers and inspectors in their selection and evaluation of pulpwood for sulphite pulping.

Density

There are several factors, however, that render density as a laboratory test a somewhat unreliable indicator of degree of decay. Sound wood varies greatly. These variations may be greater than the differences in density from tree to tree and a large number of determinations are necessary to arrive at a true average, density between sound and decayed wood; variability in volume of the wood with changes in moisture content is also a disturbing factor. Evidence is still lacking furthermore, to prove a direct parallelism between density and degree of decay. The data in Table 1 indicates that insofar as the samples included in this investigation are concerned, such a general parallelism does not exist.

Discoloration of the Wood

The volume of discolored wood, as compared with the total volume, Table 1, is clearly not an indication of the possible yield of pulp and should not be taken as a measure of the degree of rot or of the pulping value of the wood except that the amount and intensity of discoloration may to some degree be reflected in a darkening of the pulp.

Chemical Properties

Some of the chemical properties of the wood are shown in Table 3, in which the samples are arranged in the order of decreasing firmness of the wood. For purposes of comparison this table also includes the yields of pulp obtained from the various samples of wood.

In all cases the solubility in alkali is higher for the decayed than for the sound samples. In the cases of advanced stages of decay, as represented by "hemlock heart rot" grade 3, and *Fomes pinicola,* there is a good parallelism between the increase in solubility in alkali and the degree of rot as indicated by the decreased firmness of the wood and by the decreased yield of pulp. Decrease in cellulose content in these cases reflects the same changes in degree of rot. For the three grades of "hemlock heart rot" the cellulose content of the wood is nearly uniform, otherwise the same relationship holds also for this type of decay.

Spruce rotted by *Trametes pini* shows an increase in solubility in alkali but an increase also in cellulose content and in yield or pulp. The pulp, however, as already pointed out, was the weakest of all those obtained in this investigation. Solubility in alkali does, therefore, give some indication of the reduction in pulping value.

It is doubtful whether a definite relationship between chemical properties and degree of decay in general can be

Table 2.—STRENGTH OF PULPS DETERMINED BY THE BALL MILL BEATING METHOD

established. The relationship must in all probability be considered with reference to the specific type of decay. The data so far obtained and the importance which such relationship would have in furnishing a reliable means of evaluating pulpwood warrant its further and intensive investigation.

Summary

1. The samples of wood investigated, with the exception of "hemlock heart rot" grade 1, were so badly decayed that, at least in the region from which they were obtained, they probably would have been called by the scaler, and left in the woods.

2. The pulps obtained from these woods cooked for news grade sulphite, with the exception of that from *Trametes pini*, are not materially weaker than those from sound wood. The strength of the pulp from *Trametes pini* was not so far below that of normal commercial pulps as to preclude its satisfactory use for newsprint.

3. The color of pulps made from infected wood may be poorer than the color of these made from sound wood, the darkening being roughly proportional to the intensity of the discoloration of the wood.

4. The yields obtained from the infected wood both on the weight and the volume basis were not materially lower than those from sound wood, except in cases in which the wood had become materially softened, or friable.

5. Wood softened or friable to such a degree as to give abnormally low yields of pulp would largely be eliminated in the wood room operations. Commercial yields per cord from decayed wood will therefore probably be lower than those from sound wood in proportion to the amount of wood so badly weakened that the decayed portion will not withstand wood room operations.

6. Some parallelism has been shown between the degree of firmness of the wood and its pulping value, the wood softened to the greatest extent by decay having suffered the greatest loss in pulping value.

7. Density of the wood is not in general a reliable indication of the pulping value.

8. The amount and intensity of discoloration of the wood may indicate lower color of the pulp but does not necessarily indicate other pulping values.

9. The solubility of the wood in 1 percent alkali may prove helpful in evaluating decayed pulpwood. Further investigation is necessary to establish the limitations to its application.

10. The lignin and cellulose contents of the wood are not in themselves reliable indications of pulping values, but may prove valuable aids in connection with alkali solubility and degree of firmness.

Grateful acknowledgement is made of the assistance of the Newsprint Service Bureau which assumed a portion of the expense of this investigation.

Want to Borrow $150,000

A meeting of the creditors of the Cushnoc Paper Company, of Augusta, Maine, is scheduled for this month, at which the referee in bankruptcy will be present. to consider a petition for authority to borrow $150,000 for the purpose of purchasing pulpwood with which to start operations again. It is proposed to issue trustees' certificates as a first lien on all pulpwood now or later owned by the trustees. With this financing, creditors believe that the business will be put on its feet again and all claims paid in full.

* * *

All Going Except One

With the exception of Machine No. 1, of the Bowdoin Mills, all of the machines in the three mills of the Pejopscot Paper Company of Brunswick, Me., are now in full operation again. The plants in Brunswick, Bowdoin and Lisbon Falls, Me., have been closed for several weeks but new orders have resulted in the resumption of all of the mills again. According to officials, the outlook is excellent for full production for several months to come.

* * *

Burned for Second Time

For the second time within a year, the storehouse of the Davis Paper Company at West Hopkinston, N. H., was destroyed by fire Feb. 12 and the loss is placed in excess of $10,000. The first storehouse, on the same site as the one just burned, was destroyed last summer. The building contained about 400 tons of paper and paper stock valued at $6,000 and the wooden building was valued at $4,000. There was partial insurance.

* * *

To Hold Annual Meeting

The Board of Directors of the Canadian Weekly Newspaper Association met in Toronto a few days ago and decided to hold the annual meeting of the Association in Toronto on June 5, 6 and 7. After the sessions 150 newspaper men will leave on a two months' tour of England and Scotland, together with the battle fields. The Empire Press Union and the English Newspaper Society are co-operating in the Old Land to make the visit of the Canadian newspaper men and women a very enjoyable event. The party sails on June 11 from Montreal on the C. P. R. steamship, Melita.

* * *

Vast Cut of Timber

Major J. I. Hartt, Inspector of Crown Timber Agencies at Orillia, states that 408,000,000 feet of timber, 3,176,000 railway ties and 649,700 cords of pulpwood will be the output of the present logging season on Crown lands in Ontario. The money paid out in bringing logs and pulpwoods to the mills will amount to $21,876,000. This does not include the cost of manufacture. Then there is the revenue obtained from the railways for freight and the money made in converting the finished lumber into such products as doors, sashes, etc.

Goes to Hammermill

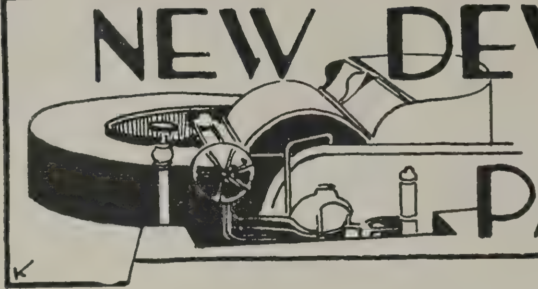
B. E. Claridge, assistant professor of forestry in the University of New Brunswick, has resigned his post and accepted a position as forester with the Hammermill Paper Company. He will be stationed on the Gaspe coast. He will not assume his new duties however, until the first of June. After graduating from Yale, he became instructor in forestry in the University of New Brunswick, later being appointed assistant professor. F. H. Gunter, formerly of the University of New Brunswick school of forestry has lately taken employment as of forestry, has lately taken employment as some months employed as such by the Wayagemack Pulp and Paper Company.

* * *

May Build Hotel

In addition to building a paper mill at St. Stephen, Hollingsworth and Whitney of Boston may build a hotel there. There is need of a new hotel, and it has been proposed that the paper manufacturing concern adopt the initiative in promoting this project. Hollingsworth and Whitney have purchased twelve separate properties at St. Stephen, and will build storage dams as well as the paper mill. This is one of the oldest paper manufacturing concerns in New England. A mill in Waterville, Me., has been operated for many years. The head offices are in Boston. In the control of the firm are valuable pulpwood tracts in Maine and New Brunswick, with the new paper mill located in the midst of the holdings.

NEW DEVELOPMENTS IN PAPERMAKING



Papermaking Process

United States Patent No. 1,482,012 is concerned with a process for manufacturing paper. The particular feature of this process consists in submitting the felt blanket of the papermaking machine to a treatment which comprises passing the blanket through a mixture of clay and water whereby the surface of the blanket is insulated against adhesive substances.

* * *

Effect of Acids and Salts on Hydrolysis of Wood

The effect of several acids and organic and inorganic acids, when used alone and in conjunction with mineral acids, upon the hydrolysis of wood is described in *Industrial Engineering Chemistry,* volume 15, pages 1164-5. Barium chloride and zinc chloride in the presence of hydrochloric acid gave yields of fermentable sugar slightly in excess of that obtained with the acid alone. Of the acids studied the most promising are the naphthalenesulphonic acids. The quantity of sugar produced from white spruce was studied, the concentrations of sulphuric acid being varied from five to thirty percent. The optimum concentration of sulphuric acid was ten per cent. the optimum time of digestion was ten minutes and the optimum pressure was 120 pounds per square inch. The effect of temperature upon mannose indicates that its rate of decomposition under similar conditions is practically the same as that of dextrose.

* * *

Waterproofing Drawing and Writing Paper

German Patent No. 378,849 is concerned with a process for manufacturing a writing and drawing paper which is not affected by moisture. The process consists in scattering over one side of the dry paper web a hard fatty substance, such as stearin, in a finely divided form and causing the particles of the fat to melt and a fatty film to be distributed over the surface of the paper by means of hot, smooth metallic devices, such as polished rollers or irons. In this manner it is possible to cause the fatty matter to penetrate into the structure of writing and drawing papers, provided they are not too thick, so that a surface is obtained which is absolutely resistant to water. The paper which becomes more or less translucent due to the action of the melted fat becomes white under the sharp pressure of the point of a drawing pencil and almost non-translucent, so that it is possible to write on the same by means of a metal pencil which produces white marks against a black background.

* * *

Sales Representative Changes Address

Kent Engineering Company, district representatives of the Conveyors Corporation of America, 326 W. Madison St. Chicago, has changed its address from 504 First National Bank Bldg. to 1110 Farnam Street, Omaha, Nebr. This engineering firm handles the sales of American Steam Jet Ash Conveyors and American Air Tight Doors, as well as other power plant equipment in Nebraska and Western Iowa.

Carbon Paper

The manufacture of carbon paper and colored papers, by a process, which is patented in German Patent No. 378,851, is accomplished in the following manner. A thin web of silk paper is drawn through a color bath. As the paper web leaves the bath it is run between a pair of squeeze rollers which remove the excess color. At the same time a dry paper web is pressed on one side of the wet web and united with the same. If coloring matter which do not posses sufficient adhesive power of their own are employed in this process, then the dry paper web is given a coating of some adhesive preparation before it is combined with the colored web.

* * *

Rapid High Pressure Digestion of Sulphite Wood Pulp

A rapid and satisfactory process, adaptable to the Ritter-Kellner and Mitscherlich methods, for producing sulphite pulp is based on the observation that wood, steeped in a solution of calcium bisulphite at a moderate temperature, absorbs from 70 to 80 per cent of the bisulphite and that this is retained by the wood during the necessary period in which the wood is raised to the highest temperature employed in the digestion. During the digestion process, accordingly, the wood is subjected to the action of calcium bisulphite which is evenly distributed through its mass. On a large scale, wood is saturated with calcium bisulphite at a temperature of 50 degrees C or 100 to 110 degrees C. With lower temperatures open vessels may be employed. Subsequently the temperature of digestion is rapidly raised to 140 degrees C and maintained there until digestion is complete, usually for a period of 1.5 to 2 hours.

For further details see *Papierfabrikant,* 1923, pages 493-5.

* * *

Malden Company Incorporated

The Malden Paper Company of Malden, Mass., has been incorporated with an authorized capital of $5,000, to make and deal in paper pulp. The incorporators are Charles Fine, Louis Werlinsky of 43 Upham Street, Malden and Samuel Werlin.

* * *

New Organization

Book and Coating Papers, Limited, is the name of a new organization which has been formed at Montreal and which will operate as jobbers in book and coated papers. The concern, which has an authorized capital of $50,000 has been granted a Dominion charter which covers a broad line of manufacture, including that of paper and paper products.

* * *

Raise Borrowing Capacity

The borrowing powers of the Whalen Pulp and Paper Company's receiver, W. Mills, have been increased by the British Columbia courts from $500,000 to $800,000. Most of the $600,000 had been used up, the working capital having been reduced to $112,000.

Manufacture of Paper

Vegetable fiber, such as esparto grass, hemp, jute, rags, etc., is boiled for 1.5 hours in an open or closed vessel at 100 degrees C with weak hydrochloric acid, for example five ounces of acid to four gallons of water, and, after separation of the liquor, is boiled at 100 degrees C for one hour with fresh water. The material, after being washed with hot water till free from acid, is then boiled at a temperature of 100 degrees C for two hours with a solution of sodium carbonate containing 455 pounds of soda crystals per ton of fiber. The resulting pulp is washed and made into paper in the usual manner. The process is patented in British Patent No. 206,010.

* * *

New Direct Color

A new direct color, known as Pontamine Brown D3GN, has just been placed on the market by the Dyestuffs Department of E. I. du Pont de Nemours & Company. It is intended for dyeing cotton or for half silk hosiery where the combination of colors used must be fast to the acid employed in scrooping. It can be used on cotton in all stages of manufacture, not only for self shades of tan and yellow browns, but also in combination for producing olives, slate browns and similar shades. It can also be applied on silk, paper, hemp, jute and leather.

* * *

Financing Announced

Financing of the Continental Paper and Bag Mills Corporation is announced. A nw issue of $6,000,000 first and refunding mortgage 6½ per cent 20 year sinking fund gold bonds are offered by a syndicate of bankers. This is part of an authorized issue of $12,000,000. The present issue will be followed, it is said, by $4,000,000 of prior preference 7% preferred stock, $2,500,000 of six per cent cumulative participating preferred stock and $3,750,000 common stock. The entire issue of prior preference stock, 70 per cent of the cumulative preferred and over 50 per cent of the common stock will be acquired by the International Paper Company. The bonds are being offered at 95 and interest yielding over 6.95 per cent.

* * *

Clocking Accidents

To encourage accident prevention, the Faluah Paper Company at Fitchburg, Mass., has erected a mammoth clock under the direction of George E. Ames, safety director of the company. During the past 115 days the clock has remained at zero, there having been no accident of any character during that time, a record which the company believes unequalled in the industry for a plant of their size. During 1923 there were 29 accidents at the plant but since Oct. 1 not an accident has occurred. Of the 29 accidents, 24 took place in the first six months of 1923. The new record established is being made a topic in addresses by industrial engineers throughout New England.

The Editorial Page

Just Going Along

THE recent commotion caused by the announcement of Attorney General Daugherty that trade associations could not legally compile and disseminate statistical information regarding their trades except through Government channels is settling down to—just nothing at all. The Chamber of Commerce has decided to go along in its old methods and the Department of Justice is doing nothing about it.

Likewise the trade associations of the land, including the multifarious organizations of the paper industry, are also proceeding along the same line they previously followed. However, several of them have exhibited considerable nervousness in the past few weeks, wondering what the outcome would be.

That the Chamber of Commerce will continue in the status quo ante, is shown in a letter from the Solicitor of the Department of Commerce, a copy of which has reached the editor of PAPER, which says:

> "The recent correspondence between this Department and the Attorney General relative to the legality of the collection, compilation and distribution by trade associations of statistics or information has caused widespread discussion, and I have been frequently asked for a statement of the attitude of the Department upon the subject. The Department of Commerce will continue to publish its monthly Survey of Current Business, in connection with which it has been receiving information and statistics from various associations. For the purposes of this and other publications and the performance of other duties imposed upon it by law, the Department will, from time to time, request associations to furnish it with such statistics as may be necessary or convenient for its purposes. The information which associations furnish will be used, within the limits of Department appropriations and facilities, in the publications to the extent that it proves suitable.
>
> "The department is not at present in a position to distribute the information received otherwise than through its publications.
>
> "The Department does not express any views as to the legal status of the association from which it receives the information, or any approval of any of its activities."

This seems to be the end of a muddled business in which the trade associations as well as the Department of Commerce wandered as though in a morass.

* * *

Timber Waste

REFORESTATION and economy in utilization of existing resources were stressed by Secretary of Agriculture Wallace in a recent address before leaders in the pulp and paper industry, as necessary to establishment of this resource on a basis independent of the outside world. Statistics make out a case for reforestation and economy in utilization that is not to be gainsaid. In recent years the drain of America's forest resources has greatly exceeded growth and reproduction.

The Government has long realized the need for conservation of forest resources and has broadcast information that warns private owners and users of timber of such need. Waste should be eliminated, growth and reproduction promoted and loss by fire prevented. In stressing these points before the leaders in the pulp and paper industry Secretary Wallace speaks in the nation's interest.

EDITORIAL NOTES

A little oil from the superfluity of the oil scandal at Washington might be used to good advantage to smooth the way of some paper companies bucking foreign competition.

* * *

United States exports of paper increased in value by a million and a half dollars last year. But that doesn't mean a thing, for the quantity of export wasn't commensurate.

* * *

"When you deny the right to a profit you deny the right of a reward to thrift and industry," says President Coolidge, editorially summing up as follows: "There is just one condition on which men can secure employment and a living, nourishing, profitable wage for whatever they contribute to the enterprise, be it labor or capital, and that condition is that someone makes a profit by it. That is the sound basis for the distribution of wealth and the only one. It cannot be done by law, it cannot be done by public ownership, it cannot be done by socialism."

PAPER PRODUCTS

Conducted by J. E. Willert

CONVERTERS ARE NOW PUSHING AHEAD

Developments of the Last 25 Years Have Been Amazing in Their Extent

PAPER manufacturers, and more especially the consuming public, would be astonished if they were aware the extent of developments in the last twenty-five years in the use of paper and the volume of business in products into which paper is converted.

Even mill superintendents who are accustomed to seeing carload orders going out to specialty manufacturing concerns probably would be surprised if they saw the extent of this business.

Concerns engaged in the business of converting paper into finished products used in a thousand or more different ways are scattered throughout the country, but largely centered in the middle west and the East. In the Fox River valley of Wisconsin are a number of plants specializing in converting tissue into napkins, towels and numberless new uses. In an article in PAPER a few months ago it was told how the Hoberg Paper Company of Green Bay had built up an enormous business in wrappers for California oranges.

Milwaukee Lace Paper Co. Milwaukee, Wis. Where Milapaco Lace Papers are made

In Milwaukee there are two concerns engaged in the manufacture of lace paper on an enormous scale. They are the Milwaukee Lace Paper Company and the American Lace Paper Company. Both of these companies make a great many other paper specialties, but lace paper is a big item in their lines.

There was a time when the housewife used newspaper to cover her pantry shelves. Lace paper can now be purchased for that or any of hundreds of other uses. In the last few years paper doilies have become a big seller. Most elaborate patterns are turned out and at a distance of a few feet they cannot be distinguished from real lace. They are cheap and do away with laundry bills, so are popular with hotels and summer resorts, but of late have gained recognition with the housewife. Of course there are tray cloths, too, and some of the sets are such as to cause any hostess to thrill with pride. The doilies are made up round, square and oval and every kind of lace is imitated. It is even possible to duplicate embroidered pieces.

As an indication of the volume of business attained in lace paper and allied specialties it may be mentioned that the Milwaukee Lace Paper Company occupies its own six story building which is some 200x75 feet and during normal operations about 200 persons are employed. There is a printing department to take care of the many special orders received. All of the machinery for turning out the product is made and designed in the plant. This is said to be the only safe method on account of the quickness with which "pirates" seize on a new design of new products and duplicate them.

Some of the other products of the Milwaukee Lace Paper Company are cake laces, strip laces, box top laces, paper specialties for confectioners, wedding box top laces, candy pail laces, paper bon bon cups, paper sundae liners, finger bowl liners, paper souffle cases, pie collars, butter chips, chop holders, paper skewers, oyster doilies, baking cups, etc.

As may easily be imagined, special machinery is required for these products. Practically all the operations are by machinery and the speed with which the completed products are turned out is surprising. It is amazing to the outsider the enormous business done in these specialties. For example take bon bon cups. Some manufacturers have them made up special with their name in the bottom of the cup or perhaps some special printing on the side of the cup. When this is done it is on an initial order of 500 thousand—just a half a million.

Value Received

By J. E. WILLERT

ADVERTISEMENTS are the sincere efforts of the advertisers to make known the active facts concerning their business. They are a true projection of themselves.

To read a magazine or paper of any kind without a thorough examination of the advertisements is a grievious error, a great opportunity is lost, you do not get value received.

Human progress has its milestones in advertisements, things that are vital to success and comfort in existence are found there.

The success of any business is proven by its persistent advertising. The wholeness of its life is founded on its product. In the recommended merit of the product lies its responsibility.

The largest concerns are the largest advertisers.

Read a magazine or newspaper entirely through, all phases of life are found in it. Its advertisements tell of trade and commerce, its stories of comedy, tragedy and love, its poetry of music.

Read a trade paper all through. Among the advertisements you will find all things you need for the proper extension of your business, in the reading matter the information and education for the conduct of your business.

Read all newspapers, all magazines, all periodicals all the way through, read everything. It means much. It is value received.

Show Them

A man came into my office one day and told me how he got an idea for a paper specialty from a moving picture. It was just the awkward way the actor portrayed a use. This specialty has sold in the millions. This man observed and went out and showed them.

There is not a commodity sold that does not have to be wrapped or contained in a package, the majority in paper. In the home, paper is continually in service. What a field for cultivation.

There is not a dealer, not a manufacturer, in the whole country who will not welcome a suggestion or an idea for an improvement in their wrapping and packing. Mr. Paper Salesman you have that opportunity.

By observation you will discover that just a little change in the sheet a storekeeper is using will effect an economy and do a more efficient job. Show him your idea of a sheet of paper.

You may know a paper bag that is better fitted to do the work necessary than the one he is using. Perhaps you can make the package more attractive. Take a bag along, fix up a package. Show him.

Some container is entirely unsuited for the purpose for which the dealer is using it and you, Mr. Paper Salesman, know one or can find one that will be just right. Get one and show him.

For every sheet and quality of wrapping paper, for every paper bag, for every paper container there is, or there can be created, a place where its use will be welcome, where it will be an economy, where it will have an ever increasing use. In the homes of the nation there are new occasions arising which will call for paper in some old form or in some new form easily to be created.

Mr. Paper Salesman, it is up to you to find these uses, to fit the proper paper to the proper use, to suggest new ideas and so increase paper tonnage, making price reductions possible, increasing sales and enlarging employment.

This article may appear idealistic, but to be a pioneer you must be idealistic, what you visualize you must work for and it is only work that brings accomplishment.

There is a great predudice that prevails everywhere against changes, so a salesman must show his customer the new way, and prove the rightness of this way. To know how to show you must be well informed, the trade paper will inform you.

Show them you know paper. It will help them and help you.

Woodpulp and Forestry Problems

ROYAL S. KELLOGG'S volume on *Pulpwood and Wood Pulp in North America* is a book that marks an epoch in the history of the woodpulp industry of this continent. It is a thought-provoking work that will be eagerly studied by economists and foresters no less than by pulp and paper manufacturers. Nine years ago attention was called by the writer of this review to the growing tendency among the important producers of pulp and paper to treat timber tracts as the agriculturist does his farm lands and crops, by careful regulation of cutting, attention to young and growing plants with regard to a proper supply of light and shade, and the subsequent replanting of cutover areas. It had been recognized for some time previously that growing timber crops for use was forestry, just as growing grain and hay in farming. Protection of the forests from fire was particularly emphasized.

The importance of fire protection in any plan for providing continual timber production has impressed students of forestry operations at all times, but never so much as at present. Mr. Kellogg repeatedly states that the cardinal principle, the thing of fundamental importance, in solving the problem of reproducing timber so as to save the paper industry of North America from extinction, is effective fire prevention. Many fires cannot be stopped, but nearly all fires can be prevented through constant and proper precautions during the danger season. When the forest is protected against fire, the work of timber reproduction is called for by nature, a future timber crop being assured. "Forestry aims at continuously productive state forest lands, and the propagation, growth and exploitation of the ripe timber crops in perpetuity." This statement, which is quoted by Mr. Kellogg from the 1922 report of the New Zealand State Forest Service, applies as fully to North America as to the other side of the world.

Just what is meant by forestry? This is answered by the author in the fourteenth chapter of his book where an account is given of forestry methods. Quite rightly he begins with a statement of negative considerations, thus:

> "Forestry is not a law compelling the planting of a new tree for every one cut.
>
> "Forestry is not a law limiting the cut to certain sizes and kinds of trees.
>
> "Forestry is not arbitrary control by any public body over the operations of private enterprise.
>
> "Forestry is not fire prevention, though this is fundamental."

After telling in this way what forestry is not, he gives a concise definition of what forestry is by stating that

> *"Forestry is the application of definite scientific principles to the growing and using of timber crops."*

The methods of forestry provide for a correct diagnosis of conditions, and it is in considering working plans that Mr. Kellogg demonstrates his familiarity with practice as opposed to what is often called theory, but which is really opinion or speculation, theory being a term that is frequently misused. In its true sense, according to J. S. Mill, theory is "the completed result of philosophical induction from experience," so that the "practical" man may be a theorist without being himself aware of it. Mr. Kellogg points out that the "practical" man is prone to make the charge against the forestry profession that foresters are indefinite in their statements as to what must be done in order to secure a continuous timber supply in any particular locality. He counters this with the observation that no reputable physician will prescribe for a patient in advance of a diagnosis, saying that only a quack deals in curealls. Neither will a forester undertake to say what should be done before he has carefully studied a given tract from all angles. After stating that the methods of forestry vary with locality, topography, climate, species, stands and hazards, he names the hazards as fire, storm, insects and fungi in this order. Forestry methods are also subject to the kind of forest product desired and they will differ according to whether the product is saw timber, pulpwood, fuelwood, poles, etc.

In addition to tables showing the properties and pulp yields of the principal American woods, in which the weight of a cubic foot of the bone-dry wood is given, as well as the fiber length, there are statistical data which greatly enhance the value of the book as a work of reference. Thus we find tables of the number and character of mills, with the value of products, number of persons engaged, the wages paid and horsepower consumed. In addition tabulations are given of the variety and quantity of raw materials used in the manufacture of paper, the statistics covering a period of forty years. Other tables show the quantities of woodpulp made, consumed and imported. Similar figures are given for the pulpwoods used, the kinds, quantities and values being fully enumerated.

The book should make attractive reading even for the layman. The two opening chapters dealing with processes of manufacture present a clear picture of the flow of timber from soil to machine-room. It is a picture that can be readily visualized as it is nowhere blurred by wordy digressions, the author having a gift of vigorous and sententious expression that goes straight to the point. In a style that is occasionally colloquial he tells all that is needed to be known by the technical man, technologist or general reader concerning the process by which wood is reduced to pulp fit for the manufacture of paper.

Some figures cited by Mr. Kellogg to show the increasing cost of raw materials will serve a useful purpose in educating the public to a better knowledge of condition in the pulp and paper industry, conditions which warrant higher prices on finished products. In 1899, for example, the 1,986,000 cords of pulpwood transformed into woodpulp cost some $9,838,000 laid down at the mills in the United States, or at an average of $4.95 per cord. By 1917 the cost per cord had doubled, while in 1920, the 6,114,000 cords that went into the wide variety of papers demanded by the public cost, in round numbers, $116,495,000, or an average of a little more than $19 per cord laid down at the mill. The cost of fuel, chemicals, equipment and labor increased in nearly the same proportion.

(Continued on page 36)

Town Hall Forum

For the Open Discussion of Trade Problems

The question before the Forum now is what method of payment for a salesman's services is the strongest incentive for intensive work and largest sales results? There are several methods of payments, among which are the following:

The salary basis.

The salary and commission basis.

The solely commission on sales basis.

The commission on money collected basis.

The co-operative plan, sharing profit basis.

The salary basis is perferred by some employers because they are always certain of their cost of selling.

The salary and commission basis is preferred by a great many of both employers and salesmen because it contains an element of both the assured and the improvable chance.

The solely commission basis on sales is purely chance, the man's entire income is based on his sales, which must be made to absolutely financially responsible houses.

The commission on money collected gives the salesman a free hand on credit and places the entire responsibility for the payment of accounts on him.

The co-operative plan or sharing of profits plan puts the salesman in the position of a partner in the concern, his only investment being his services. This plan necessitates a thorough understanding of what a cost is and how it is arrived at.

Which one of the above plans brings the best results to a large degree is dependent on the kind of salesman it is applied to.

There is the man of the temperament who must be assured of a definite income to instill him with the confidence necessary to make a sale. Then there is he who must have a little income assured but is willing to take a chance on part.

Apart from the foregoing types stand the men who maintain they want the full benfit of their efforts and so prefer the commission on sales, commission on money collected or profit sharing plan.

Entering in the application of any plan also is the manner in which different salesmen work. There is the man who hews right up to the line consistently, never asking for special favors, never complaining, and against him we have the one who is always wanting special concessions in price or selling nothing else but close-outs. The lame duck looms up in this connection, he who is always wanting help.

Territories are a factor in determining this question, some are more prolific than others in order production, the expense of covering some greater than others.

The salesman is a vital part of any onconcern, the position he holds is of the **greatest importance.** He must coordinate perfectly with his concern and to do this he must be financially satisfied, his ambitions must be aroused and his confidence made secure.

How can it be done? By which plan of selling can the largest number of salesmen be made to bring the largest results?

Of course in such a discussion the plan must be equitable. Shall the same salary go on in both dull and prosperous times or shall it be fixed to change the same as a commission or profit sharing basis will change as sales vary?

This question should be be of interest to every manufacturer, every jobber and to every salesman. It is interesting and vital. Already we have opinions which will be printed in the Forum next week. The Forum is open to you, let us hear opinions from manufacturers, jobbers and salesmen, we will quote you as you may direct.

* * *

The Forum solicits any question, which will be printed for open discussion.

* * *

Link-Belt Changes

Mr. C. S. Huntington, Sales Engineer in charge of the Sand and Gravel Washing Division of the Link-Belt Company, Chicago, and perhaps one of the best known plant engineers in that field, has been appointed to look after the interests of the Link-Belt Company in the cement industry, in addition to his regular duties.

In taking over this work, Mr. Huntington will continue to make his headquarters in Chicago, he looking after the cement business through the various plants and branch offices in the Western Division.

* * *

Mr. Howard MacNeal, formely of the Philadelphia plant of the Link-Belt Company, has been transferred to the Chicago works of that organization, where he will bend his efforts in the promotion of portable loaders, portable belt conveyors and electric hoists.

* * *

A Plant for Manila?

Rumors come from Manila that "the government contemplates the establishment of a paper pulp plant for experimental purposes."

In the Far West

Start Construction Work

April 1 is the date announced at the latest board of director meeting of the newly organized Portland Pulp and Paper Company, for the actual beginning of construction work. The first unit of the immense plant that will eventually cover an eight-acre tract will be placed at that date under construction for a 50 ton per day output. Joe Kaster, vice-president of the concern, with twenty-five years' experience in the active lines of the paper manufacturing industry of the Pacific Coast has arranged to manufacture with a special process of eliminating the pitch from fir lumber, and in availing himself of the new sulphite process of reducing wood to paper pulp will cause the Portland Pulp and Paper Mill to be the first on the coast to use this process. With an extended contract for utilization of the entire waste products of the Monarch sawmill, situated near the location for the new paper plant, production will be on a very low cost basis.

* * *

Start Work May 1

Ernest Schweitz, engineer in charge of the construction work of the new Columbia River $1,500,000 paper mill at Vancouver, Washington, announces that on the first of March machinery will be moved into place, so that actual operation will be possible from about May 1. Vegetable paper will be the specialty of the Columbia River Paper Mills.

* * *

New Bleacher Building

A new bleacher building and increased transformer capacity are among the improvements to be effected at the immense plant of the Oregon Pulp and Paper Mill at Salem, Oregon, where wrapping paper, glassine, grease proof, and tissue paper are the principal output. Approximately $20,000 will be expended on a three story reinforced concrete structure 42 x 66 in dimensions to be used as a bleacher building, and a new 4500 kilowatt transformer will replace the present 1500 kilowatt one.

* * *

Norwegian Market Better

The paper and pulp market in Norway has reached its lowest level, and, as a result of the cessation of sales from Sweden, an improvement is noticeable, according to articles appearing from time to time in the Christiania Press. While inquiries are constantly coming in, however, so far transactions which would justify the forming of an opinion as to prices have not been concluded.

The chemical pulp market has been very much disturbed by the recent low quotations from Germany, Sweden, and Finland, but evidences are not lacking that prices have touched bottom, and sales prospects for the year 1924 seem brighter.

* * *

Short Snappy Items

The contract has been awarded to the Morton C. Tuttle Co., for erection of administration building for the Brown Paper Mill Co., Inc., in Monroe, La.

The Union Paper Bag Co., of Bogalusa, La., of which C. B. Sanders is secretary, has plans almost completed for a new paper bag factory to be erected at that point.

The Bogalusa Paper Co., of Bogalusa, La., has increased its capital stock from 2,000,000 to 4,000,000.

The Crown Paper Box & Label Co. has been incorporated in San Antonio, Tex., with a capital stock of $9,000, by Leon Singer, Lillie Singer and M. J. Arnold.

PAPER COMPANY ROBBED OF PAYROLL

Long Island City Paper Company Loses $2,570 to Hold-Up Men

IN a payroll hold-up where three armed men boldly entered the inner offices of the Ravenswood Paper Company, No. 22 Marion Street, Long Island City, and took more than $2,570 from the desk of a girl cashier, featured several crimes committed recently.

As Miss Grace Couch of No. 508 First Avenue, Astoria, sat counting out weekiy wages in the paper company's offices, three men entered. One pointed a revolver at Miss Lena Fruchten, telephone operator.

The second backed the manager, Eugene Boggs, into a corner, while the third swept bills and silver in front of the cashier into his pocket. In his haste, he dropped about $60 in change. The three escaped in an automobile.

* * *

Prices Advance

The Mathieson Alkali Works, Inc., announces a further advance in its prices for Liquid Chlorine and Bleaching Powder, effective February 14th, 1924, to apply on all business for future delivery taken after that date, as follows:

Bleaching Powder for spot sales and contracts for future delivery in carloads.

$1.75 per 100 lbs. in standard (700 lb.) drums f.o.b Niagara Falls

$2.00 per 100 lbs. in small (300 & 400 lb.) drums f.o.b Niagara Falls

Liquid Chlorine for spot sales and contracts for future delivery in tank car lots and in cylinders.

$4.00 per 100 lbs. (Single Units or Multi Units) f.o.b. Niagara Falls

$5.00 per 100 lbs. in cylinders, in carload lots, f.o.b. Niagara Falls

$5.50 per 100 lbs. in cylinders, for sales of more than one ton, f.o.b. Niagara Falls

$6.00 per 100 lbs. in cylinders, for sales of one ton and less, f.o.b. Niagara Falls.

"Shipments in less-than-carloads, spot or contract, fifteen cents (15c) per 100 pounds above these prices."

* * *

Envelopes Used Long Ago

The first envelope of which there is any knowledge enclosed a letter sent 226 years ago by Sir William Turnbull to Sir James Ogilvie. The epistle dealt with English affairs of state and, with its covering, is carefully preserved in the British Museum.

At that period, and long afterward, it was the general custom to fold letters and seal them with wafers of wax.

Early in the last century envelopes began to come into more general use, and stamped adhesive envelopes achieved wide popularity in England shortly after the establishment of the penny posts in 1840, and by 1850 were largely used on this side of the Atlantic.

The first machine for the manufacture of envelopes was patented in 1844 by George Wilson, an Englishman, and improvements were made the following year by Warren De La Rue and E. Hill.

* * *

And They Reminisced

When James O'Hara, superintendent of the Crown-Willamette Paper Company paper mill at Lebanon, Oregon, visited the West Linn, Oregon paper mills belonging to the same company he was shown through the mills by Thomas Warner, the West Linn paper expert. Mr. Warner was backtender 52 years ago for Mr. O'Hara's father who was then a machine tender at Newbery paper mills in Ontario.

Chicago Notes

Seaman Paper Co. Moves

The Seaman Paper Co., one of the largest distributors of news print and book papers in the west, will move its general offices on May 1st into the Wrigley Building, 400 N. Michigan Avenue, Chicago. The new quarters will be larger and more commodious in every respect.

For a number of years the Seaman Paper Co. has been located at 209 S. La Salle St., in the Continental and Commercial National Bank Building. Prior to that time the company was in the Tribune building. The growth of the firm has been rapid, and inability to secure enough space is given as one of the prime reasons for moving.

The Wrigley Building is one of Chicago's newest and most modern sky-scrapers. It stands at the head of the new "Boulevard Link," which is that part of Michigan Avenue recently reconstructed to connect the down-town business district with the north side. The growth of the business section is decidedly northeast, toward the region where the Wrigley Building is located.

* * *

Ellis Jones, secretary of the Kansas City Paper House, one of the leading western jobbers, spent a few days in the city during the week.

* * *

H. W. Sutter, of the Champion Coated Paper Co., is spending several weeks at Miami, Fla.

* * *

Prices Are Firm

Prices in the local paper trade have been firm during the past week. The high grade mills seem to have about all the business they can handle, and some of them have more than they can take care of in the usual time.

The jobbers are showing a disposition to withhold orders until the last moment. Upon placing orders, however, they are in a rush for delivery, indicating that their own demand is active, or in other words, that they have customers who have placed orders and are also awaiting delivery.

More confidence in present prices would go far toward improving business. Stocks in the hands of the jobbers are considered low for this time of the year, and there is said to be too much rush replacement on sizes and weights which should be carried in stock in more substantial quantity.

* * *

Clark Retires

Edgar Rickard, president of the Pejepscot Paper Company, Brunswick, Maine, announces changes in the organization of the company. Frederick C. Clark, resident manager, has retired and the regular staff will take care of operations. Charles Dickenson, general superintendent for 30 years will be in charge of the operating department, and Edgar S. Catlin, chief assistant in the administration branch, will be direct administrative representative of the president and the board of directors.

* * *

Oppose Waterways

The sentiment in Maine appears to be against the St. Lawrence Waterways project. The Maine representatives on the New England Joint committee that held a session in Boston, February 8 and 9, lined up in opposition to the project.

Through the Middle West

DISCUSS SHOP COMMITTEE PLAN

Kimberly-Clark Officials Talk Over New Plan at Luncheon

THE shop committee plan of handling its employes, which has been in effect in Kimberly-Clark company paper mills at Appleton, Wis., the last four years, was discussed by S. F. Shattuck of Neenah at the last weekly luncheon of the Appleton Rotary club at the Conway hotel.

Before relating his company's experience with this new system of co-operation between employers and employes, Mr. Shattuck touched on the experiences of the Bethlehem Steel works and the Pennsylvania railroad which were among the first to adopt it.

President Grace of the first company refused to give out any statement as to the success of the venture the first five years and then invited John Coulter to make an investigation. Coulter spent several weeks in the plant and then gave out a complete account of what he found. Seventy-one per cent of the 2,365 cases that came before the various bodies were decided in favor of the men, he said.

The salient fact in the Pennsylvania railroad's experience with the plan was that when the shopmen's strike was called 85 per cent of the men voted allegiance to the company. Mr. Shattuck recalled also the experience of the Brooklyn Transit company and Philadelphia street car company which corresponded with those already mentioned.

The speaker said the Kimberly-Clark company adopted the plan in 1920. A committee of fourteen men was organized at Niagara and another committee of fourteen at Niagara Falls. Of the 74 men elected to serve in the Wisconsin plant only nine had been with the company less than five years. In other words 65 had been with the company more than five years, from 5 up to 40 years. Older men usually are elected to these positions, Mr. Shattuck said.

"Of course when any such plan is considered," said the speaker, "the first thing proposed is the wage question. Since then nearly everything has been taken up. Rents in Kimberly and Niagara have been revised and likewise the sale of houses to employes. Overtime rules frequently make their appearance before the council.

"Various questions relating to watchmen come up and it was only this last week that one such matter was considered. Heat in various departments also comes in for consideration. At the Niagara plant a municipal swimming pool has been installed. A vacation system has been agreed to at Kimberly."

The speaker declared the union is opposed to the mill council plan and said the charge made against it is that it is composed of members industrially unassociated with the men outside and that it has no financial backing of nation-wide organizations.

Mr. Shattuck explained the relation of foremen to the council and said at the Niagara plant they have a foreman's club which holds monthly meetings to which the councilmen are invited. Just recently at the Niagara Falls plant a meeting of the council and foremen was called following a serious accident, Mr. Shattuck said.

* * *

As a proposition which is right, fair, honorable, economical, humanitarian and on the square, the safety movement deserves the loyal support of every American citizen.

Fortune To Family

The entire fortune of the late George Edward Bardeen, pioneer paper manufacturer of the Kalamazoo river valley who died recently at his winter home in St. Petersburg, Fla., was left to the immediate family by the terms of the will, which has just been admitted to probate at Allegan.

The value of the estate was not fixed in the will, but it is generally believed that it will be upwards of a million dollars. The Otsego and St. Petersburg mansions are left to the widow, who, with her two children, George Edward Bardeen III, and Mrs. Margery Bardeen McClellan, inherit nearly the entire estate, only small bequests having been made to a brother, two half-sisters, and eleven nephews and nieces.

At the time of his death, Mr. Bardeen was president of the Kalamazoo Stove Company and the Globe Casket Company of Kalamazoo, but his chief interests remained in the paper industry and he was a director in nearly every mill in the valley as well as heavily interested in many other important financial and industrial enterprises in Kalamazoo and Otsego.

* * *

Off to Europe

John Traquair, of the Research Department of the Mead Pulp and Paper Company, Chillicothe, sailed for France on Saturday, February 16. He will be gone about two months. He will study the newest developments in European methods of manufacture.

* * *

Workman Near Death

Twisted around a shaft in the Telulah mill of the Fox River Paper Company Friday afternoon, Rei Holcomb, 28, an employe of the mill suffered serious injuries and narrowly escaped death. The accident occurred when his clothing became caught on a screw. Suddenly the workman was picked up and twisted around the shaft. At St. Elizabeth hospital where he was taken an examination showed his left leg was broken between the knee and ankle. His left elbow was severely bruised and he also suffered lacerations at the back of his head.

* * *

Obliged To Curtail

Many Wisconsin mills were obliged to curtail operations temporarily by the most severe blizzard of the winter which struck here the first week in February. The snow was so deep railroad transportation was tied up several days and in some cases workmen were unable to get to the mills. The Peshtigo Paper Company at Peshtigo was one of those forced to shut down, but the mill was able to resume operations on February 11.

* * *

Off On Tour

Two Interlaken Pulp and Paper company executives sailed from New York on Feb. 16 for an extended tour of Europe during which they will make a study of paper and pulp manufacturing conditions in several countries. The two men are H. A. Babcock and Vance P. Edwards. Mr. Babcock and Mr. Vance expect to be gone about two months and will visit cities in England, Norway, Sweden, Finland, Germany, France and other countries.

* * *

The Changing World

We used to blow out the gas; now we step on it.

NAME CHAS. A. GOODMAN PRESIDENT OF COMPANY

Chosen to Head Peshtigo Paper Company at Recent Election

CHAS. A. GOODMAN, of Marinette, Wisconsin, lumberman, and one of the best known men in that industry, heads the Peshtigo Paper Company; Mr. Goodman was named to this important place at a meeting of the directors of the company held recently at their offices in Peshtigo. He succeeds John J. Sutherland of Dayton, O., who held the place since the merging of the Peshtigo Paper plants.

D. C. Everest, secretary and general manager of the Marathon Paper Mills Company at Rothschild, Wisconsin, also identified with several other paper manufacturing concerns, was named as vice president. The personnel of other officers of the company remains unchanged.

The annual meeting of stockholders of the company will be held in Peshtigo on Monday, February 21st.

* * *

Annual Election

The annual election of members to serve on the mill council plan was held at the Niagara mill of the Kimberly-Clark company by employes of all departments last week. The nominating ballots were issued by tellers from the respective departments, the two in each department having the largest number of votes to represent that department.

Following are the results of the election:

To represent the finishing room: Rollo Steeno, 45; Ed Olive, 11.

Sulphite and bleach department: Albert Johnson, 42; Emil Saler, 29.

Wood yard, warehouse and pulp yard departments: Edward L. Kelly, 22; Ed Bouche, 17.

Power and storage departments: Edward Bovee, 35; Max Raboin, 27.

Maintenance and statistical department: Harry Currier, 49; Elmer Bowman, 16.

* * *

To Study Paper

Henry A. Babcock and Vance P. Edwardes of the Interlake Pulp and Paper Co., Appleton, Wis., sailed for Europe, February 16th, to make a study of paper and pulp mills. Mr. Babcock is manager of the mill and Mr. Edwardes is superintendent of the sulphite department. They expect to be gone two or three months.

* * *

Doubles Its Capacity

Doubling the capacity of the Berlingham-Prosser Company at Kalamazoo, Michigan, will be considered at a meeting of the board of directors in March, it has just been announced. The board at that time will act on a proposal to erect a new building approximately the same size as that already in use. The new building will be constructed of reinforced concrete and brick and will be four stories high and 60 by 176 feet wide and long, giving a total floor space of 84,480 square feet. The company will then have the largest wholesale paper warehouse in Michigan.

* * *

Children are instinctive like minnows—attracted by bright colors and moving things; watch out for and protect them.

HONOR THE MEMORY OF LOUIS DESSERT

Resolution Passed by Directors of Wausau Sulphate Fibre Company Regard Former Director

DIRECTORS of the Wausau Sulphate Fibre Co., Wausau, at their annual meeting adopted a resolution honoring the memory of Louis Dessert, second vice-president and director, who died recently. The resolution characterized Mr. Dessert as a member of "that fast vanishing group of men and women that were the glory of early Wisconsin history."

"In the passing of our associate and friend, Louis Dessert, our company has lost an officer and director who ever looked upon his position as a trust for which he was responsible to all the stockholders," the resolution stated. "No claims of friendship or personal advantage could swerve him from his duty to the welfare of the companies of which he was a director or officer. Nor did he ever hesitate to put his material resources as well as his moral support back of every enterprise in which he was interested, when days of stress required loyalty and courage. Never afraid of taking a chance for himself, yet he was conservative where other stockholders were considered, that could not afford to risk their holdings. These qualities brought dignity, respect and stability to the corporations in which he was interested.

"We shall miss our friend for he had the enduring qualities that win the favor of men. He was modest, simple in his tastes, unostentatious in his life, humble as to his ability, of irreproachable habits, a man of truth and integrity, a passionate lover of nature in her divine enchantment, a gentleman who ever rejoiced in the success of others and sympathized with them in their troubles."

* * *

Dam Honors Alexander

The new dam across the Wisconsin river, above Merrill, Wis., built for the Wisconsin Valley Electric Co., has been named Walter Alexander dam in honor of Walter Alexander, a stockholder in the company since its organization. Mr. Alexander also is vice-president of the Marathon Paper Mills Co. and connected with various other industries. Directors, at their annual meeting, elected the following officers: President, C. C. Yawkey; vice-president, B. F. Wilson; secretary and general manager, H. L. Giese; treasurer, C. S. Gilbert. The foregoing and J. S. Alexander, G. D. Jones and A. L. Kreutzer are directors.

* * *

Snow Stops Logging

A severe snowstorm this week swept over Wisconsin and affected papermills and logging operations. Drifts from five to twenty feet high prevented many men from reaching the mills in the Fox river and Peshtigo river valley for a day or two and production was materially decreased. Deep snow in the woods is interfering with the getting out of pulpwood.

* * *

Re-elects Officials

With production at peak volume and an expansion program that is being carried out rapidly according to plans announced a year ago, the Bryant Paper Company at its annual meeting, Saturday, February 9, re-elected all its officials and board of directors. The board's membership, however, was increased to ten to make a place for H. E. Floercky, son-in-law of the late Frank Milham, long president of the book paper concern. Felix Pagenstecher was re-elected president; W. B. Milham, vice-president; and C. A. Fox, secretary and treasurer.

The Salesman's Forum

HAVE YOU EVER SEEN HIM?

DONALD W. WHITELAW

Here is a go-getter You can see it in his eyes and in his every lineament of his face. When he starts out for business you can rest assured he is going to get it. Not that he will make himself offensive. Far from it. But his affability, his good fellowship, his knowledge of what he is selling and his talking ability just naturally win him both friends and customers.

He is the northern representative of the Sabin & Robins Paper Company, mill job lot distributors, of Middletown, Ohio. He is no ordinary salesman. He is vice-president of the company and has risen from the ranks.

Mr. Whitelaw only recently leased an extensive warehouse at 8134 Mackie Street, Detroit, Mich. He will carry there a complete stock of paper, such as is distributed by this well known specialty house.

While this warehouse is in Detroit, you can look for Mr. Whitelaw anywhere.

Before going on to something else, look at him again, so that when he comes in to see you, you will recognize him. When he smiles broadly, we will bet a ginger cookie, he has a dimple in his cheek.

Look for him.

* * *

Bought Mill Years Ago

Purchase of the Star Paper Company, established over a decade ago by Selig Stern, has just been announced by Bert Cooper and Frank Niessink. The concern will remain in the same quarters and will continue to handle a complete line of twine, wrapping papers, stationery, office supplies, and all kinds of paper novelties. Cooper was for years purchasing agent for the Kalamazoo Paper Company and more recently was assistant treasurer of the Dunn Sulphite Paper Company of Port Huron. Mr. Neissink has been associated with his father in the wholesale and retail grocery business.

* * *

Two Chicago taxicabs made five hundred trips, 3 miles for each trip. One driver drove as fast as he could and the other never exceeded twenty miles an hour. Comparison of records showed a difference of 39 seconds between average trip time of two cabs. Write your own moral.

BAKER HEADS EXPOSITION COMMITTEE

Association Head to Urge Paper Mills to Have Exhibits

A FORWARD step in the direction of making the Second Paper Industries Exposition the big success it should be was taken at a meeting of the Advisory Committee held at the Belmont Hotel, New York, on Thursday, February 14, when Dr. Hugh P. Baker, who was elected chairman of the committee, consented to sending out a special letter to members of the American Paper and Pulp Association and to many manufacturers not in membership, urging them to participate. Prof. Ralph H. McKee, secretary of the Advisory Committee, is to send out another letter for the Advisory Committee asking the manufacturers of papers and paper products throughout the country if they are to be represented with exhibits at the exposition, and if not, why not.

A luncheon preceded the meeting, which was attended by as many of the local members of the Advisory Committee as could be got together. Fred W. Payne, co-manager of the exposition, described the progress that had been made to date in interesting possible exhibitors. He complained of a certain inertia that prevailed among the manufacturers of paper, many of whom were holding off from exhibiting until they could learn what their competitors intended to do. After a round-table discussion in which the business and educational features of the forthcoming exposition were emphasized from different angles it was voted to send out a special appeal to members of the paper industry asking their support for the exposition.

The custom of certain manufacturers of hiring rooms at hotel headquarters during convention and exposition week to which visiting members of the various associations in annual meeting are invited to call and look over samples was disapproved, this being considered as a possible factor of opposition to the exposition. Seeing that the Paper Industries Exposition was conceived originally for the benefit of paper manufacturers as a whole, besides being an educational institution where the public could inspect the range and varieties of papers made in the United States, and where capitalists might be shown the extent and importance of the industry, there had been a singular lack of appreciation on the part of those most nearly concerned.

It was pointed out that all of the paper manufacturing firms which had exhibited in 1923 had contracted for space in the Second Annual Exposition to be held during the week of April 7, 1924, one of the larger manufacturers having even trebled his space.

What it is that keeps some of the more prominent papermaking firms from improving the opportunity of displaying the products of their mills at so great an educational opportunity as is represented by the Paper Industries Exposition, is something of a mystery to the Advisory Committee as well as to the exposition management.

The Advisory Committee of the Paper Industry is determined to know the reason why more manufacturers are not lined up with the exposition management in staging a truly representative exposition of paper manufactures and letters will be sent out soon by Professor McKee as secretary which should clarify the situation and let the managers of the exposition know what they may expect in the way of exhibits from the principal papermaking centers.

Dr. Hugh P. Baker is greatly interested in the success of the exposition and has promised the full support of the American Paper and Pulp Association to it.

Save while you're young—aren't you glad your rich grandfather saved when he was young?—*Tree to Trade.*

News from New England

I. W. W. BUSY IN THE MAINE WOODS

Pulp and Paper Companies Complaining That Operations Are Impeded

MAINE pulp and paper companies operating in the vicinity of Greenville have been much bothered of late by the activities of organizers of Industrial Workers of the World who are said to be encouraging the men to demand different working conditions and making them dissatisfied with their lot. As a matter of fact the large companies operating in Maine afford remarkable conditions for the men, the food being of the best and excellent accommodations afforded. In this connection it is interesting to note the remarks of Governor Percival P. Baxter of Maine who has just returned from a visit to the woods in order that he might examine working conditions at first hand. Governor Baxter says:

"Conditions in the Maine woods have changed a great deal in the past twenty years and today, although the life there is rugged, there is a degree of comfort unthought of in the years gone by.

"Some of the larger companies have done everything possible for their employes. In those places the camps are kept clean and orderly and the food is simple and wholesome. As for the horses in the woods, their life is hard but the up-to-date companies have provided proper stables and competent hostlers.

"Much of the work, however, is done today by sub contractors or jobbers, many of whom are French Canadians from the Province of Quebec and foreigners from the Slavic States. These people do not know how to care for themselves or their animals, and life is hard for both. They need to be taught how to live and how to treat the faithful horses that work so hard for them.

"In one place I saw two new stables equally well constructed, one for the company's horses, where everything was clean and dry, and the other, with the same equipment, in a deplorable condition where the poor animals would come in reeking with sweat only to stand poorly blanketed in a wet, dirty place. My sympathy went out to these poor animals even more than to the men because they, at least, could do something for themselves.

"Liquor conditions in the woods of Maine are better than they ever were before. It is seldom that any quantity is brought across the border, due to the county authorities as well as to the detectives that some of the larger companies employ. The woods camps of Maine will average well up with the cleanest towns and cities of the state as far as liquor is concerned.

"Life in the Maine woods in winter is hard at best. To work in zero temperature in driving wind, hauling loaded pulp and long lumber, taxes the endurance of man and horses. The day we left the wind was blowing 40 miles an hour with the temperature 12 degrees below zero, but the horses and the men went to work in the woods as usual at daybreak. I do not see how they stand it.

"We visited some of the camps kept by French Canadians and life is about as simple there as can be imagined—one room with a few bunks, a stove and some kitchen tools with absolutely no comforts—not a book or newspaper, where the people are up two hours before daybreak and go to bed soon after dark.

"The cost of getting out Maine's annual crop of wood is heavy. Men are injured and horses are thrown about over stumps and logs and are driven through places that seem impassable, but if all the companies and operators were as considerate of their employes and animals as those at Rock Pond Farm, Somerset County, the hardships would be reduced to a minimum.

"Many people look upon the map of Maine and imagine that the great northern forests are uninhabited. As a matter of fact, there are countless tote roads and trails that form a network of communication into every nook and corner of the woods. These roads in winter are, as a rule, in good condition and camps may be found every few miles. I found one man 70 years old living in a camp eight miles from his nearest neighbor, paralyzed on one side and using a crutch. He refuses to leave the woods, has not a dollar in the world and would freeze and starve to death unless the tote team drivers, who pass his camp every day or so, brought him wood and clothing. This man is an old woodsman with a kindly, patient face, but some day before long the tote team drivers will stop at his camp and find that he has gone. I never saw a more desolate place but he came to the door and smilingly waved 'Good-bye' as we drove away into the blizzard."

* * *

All Made at Holyoke

President S. L. Willson of the American Writing Paper Company has announced that practically all of the paper which is to be furnished by this company to the federal government will be manufactured at the mills of the company in Holyoke. The government order is for 19 lots of paper totaling 7,637,000 pounds for the year commencing March 1. The contracts amount to a total in excess of $790,000. The award was made by the joint congressional committee on printing. Bringing of this business to Holyoke will mean a general improvement in the entire paper trade and industrial situation in Holyoke.

* * *

Operating Full Time

The Pejepscot Paper Company, Brunswick, Maine, is now operating on a full time schedule for the first time this year. All paper machines in the three mills with the exception of the Nol machine at the Bowdoin Mill are steadily at work. The Lisbon Falls plant has been shut down for six weeks, and the Bowdoin Mill has been idle for the greater part of that time. Present indications point to a long run.

* * *

To Manufacture Boxes

The New England Box Company, Greenfield, Mass., has been organized to manufacture boxes. The authorized capital of the company is $1,400,000. Charles H. Keith, president; William E. Dickinson, treasurer; and William S. Keith, secretary, are the officers of the concern.

* * *

To Erect Building

The Waterbury Paper Box Co., Waterbury, Conn., has awarded a general contract to the Clark Construction Company for the erection of a third story on their present two-story building. It is also planned to build an addition to the boiler house.

* * *

Buy 21 Tracts

The Oxford Paper Company, Portland, Maine, has purchased 21 tracts of land owned by the Oxford Lumber Company in Rumford, Peru, Bryon and Milton. The purchase price was under $26,000.

HASKELL A PIONEER

Col. Edward Howard Haskell, whose death from pneumonia, occurred recently in Pasadena, Calif., although a native of Massachusetts, took a very material part in the development of the paper industry in Maine. He was a volunteer in the Civil War and on his return home was engaged for a time in the newspaper business but soon shifted to the paper industry in which he was engaged for many years. In conjunction with Garret Schenck he built and operated the Rumford Falls Paper Co., the property afterward being sold to the International Paper Co. After this sale Mr. Schenck and Col. Haskell inaugurated the plans for the organization of the Great Northern Paper Co. and there followed the construction of the great mills of the company at Madison, Millinocket and East Millinocket. From its inception to the time of his death Col. Haskell was a director in this company and also a heavy stock holder. Col. Haskell several years ago retired from the active paper business and devoted his energies largely to the Haskell-Dawes Machine Co., producing cotton mill machinery. Col. Haskell was a very public spirited man. He gave $150,000 to the New England Baptist hospital and at the time of his death was building a nurses' home on Parker Hill, Boston. In 1919 he presented a modern gymnasium to the Shanghai Baptist college and was greatly interested in the American Girls' college at Constantinople.

* * *

Move Office to New Haven

The J. B. Engineering Sales Co., who are Connecticut sales representatives of the Conveyors Corporation of America, 326 W. Madison Street, Chicago, have moved their office from Hartford to Chamber of Commerce Building, New Haven, Conn.

This firm handles the sales of American Steam Jet Ash Conveyors and other power plant and engineering specialties.

* * *

Held "Office Warming"

The Hollingsworth & Vose Company, paper manufacturers of West Groton, Mass., and East Walpole, Mass., held an "office warming" of their new offices in the Province Building last week. The entire main office force, delegations from both of the mills and many guests including the staff of the International Purchasing Co., of Boston, were present. There were brief remarks from prominent officials and games, dancing and a general social good time. The offices were warmly praised for the arrangement and appointments.

* * *

New Firm Incorporated

The Poquonock Paper Co., Windsor, Conn., recently filed a certificate of incorporation under the laws of the State of Connecticut. The new company is capitalized for $300,000. William S. Kenyon, 16 Darien Street, Hartford, Conn., heads the new corporation.

* * *

Heavy Fire Damage

Between $4,000 and $5,000 damage resulted from a fire in the one-story building on Moulton Street, North Cambridge, Mass., occupied by Angelo Stephano as a paper warehouse last week. The cause of the fire is not known. Mr. Stephano plans to rebuild at once.

SAYS EMBARGO WOULD WORK HARDSHIP

Paper Manufacturers of Maine Hold an Informal Meeting

AT an informal gathering of pulp and paper manufacturers of Maine at Portland last week, the Canadian embargo was discussed. The embargo is now under consideration by a royal commission in Montreal.

George F. Teed, pulpwood dealer of Montreal, said that the supposed unlimited supply of pulpwood in Canada was a myth and that there is only a strip about three hundred miles wide, running from coast to coast, which is suitable for pulp. Further north, he said, is only a scrub growth. He estimated that within a period of twenty years the supply of pulpwood in Canada would be exhausted.

Mr. Teed said that at present there is overproduction and wood can be purchased cheaply. He said that while Canadian mills were paying $17 for pulpwood, mills in United States were paying $21 and the freight was but about 70 cents. The largest part of the export wood goes to New York and Pennsylvania. If, however, mills in the United States have to pay much more, they will get their supply from Europe.

E. Martineau, another Montreal dealer, said that while an embargo would have been a good thing years ago, today it would work great hardship and heavy losses, both financially and in population because many farmers now selling wood in the winter season, would be obliged to go elsewhere.

* * *

Get Fine Contract

The American Writing Paper Company of Holyoke, Mass., which recently was awarded large government contracts, is already at work filling the contracts. At the meeting of the bondholders, held in Boston, announcement of these contracts was made in detail. These include 2,000,000 pounds of machine finish book paper, six different lots of white writing paper aggregating 5,080,000 pounds, four lots of commercial ledger aggregating 1,200,000 pounds, 105,000 pounds, of colored antique cover papers, 125,000 pounds of colored machine finish cover paper, 36,000 pounds of white bristol board.

* * *

Carew Gets Some

The Carew Mill of South Hadley, Mass., was low bidder on two lots of government paper, calling for 90,000 pounds of colored commercial ledger paper, 150,000 pounds of white heavy ledger paper, and two other contracts aggregating 13,000 pounds of white index bristol board. Work on these lots for the government will be started this week.

* * *

Buy Big Building

The Wakefield Paper Box Company of Wakefield, Mass., has purchased the large building in the rear of the Brown Block, Main street, Wakefield, owned by the Wakefield Real Estate & Building Association, which has been occupied by the company for several years under lease. The company plans to make some alterations and enlargements. The company has been located in the building since 1911 when it was burned out of its former location in the Cutler property fire.

* * *

So far none of the paragraphers, in this neck of the woods at least has referred to Elihu as the Root of All evil.

FITCHBURG IS FORGING AHEAD RAPIDLY

Paper Mills Are Rushed, Improvements Being Made and Production Speeded Up

FITCHBURG, Mass., has rapidly been forging to the front as a paper manufacturing city until at present it produces in its several mills 292,000,000 pounds of paper annually. This product is largely used in periodicals, cigar wrappers, cigarette packages, blotters and other specialties.

There are now 30 paper machines in operation in the city, producing sufficient paper 136 inches wide to encircle the globe every ten days. The estimated payroll in the industry is $7,000 per week as there are some 1800 persons employed in the business.

The Crocker-Burbank Co. is the largest of the Fitchburg paper manufacturers, with 20 machines producing book paper, bristols and index paper. Among the company's largest customers is the Curtis Publishing Company, publishers of the *Saturday Evening Post and Ladies' Home Journal*. Alvah Crocker is president and treasurer of the company.

The Fitchburg Paper Company has seven machines and manufactures coated and lithograph stock, English finish book paper and wall paper. George R. Wallace is president and treasurer.

The Faluah Paper Company runs two machines and makes car sign paper stock, coated and lithograph and postal cards. Irving F. Lowe is president. Most of the stock of electric car signs in the country is made at this plant.

The Rollstone Paper Company, formerly the Wheelwright Company, has one machine making glassine and greaseproof stock. Louis T. Stevenson is president.

Of the materials used in the manufacture of these papers, approximately one-third is old magazine stock. About 25 per cent is sulphite pulp and is imported from Finland, Sweden, Norway, and in much smaller amounts from Germany and Russia. About 25 per cent is soda pulp, most of which is produced in this country. About 20 per cent is clay, imported from the chalk cliffs of England with a small amount supplied in this country.

Fitchburg is one of the largest purchasers of paper stock in the country and the growth of the industry in that city has made Holyoke, Mass., and Kalamazoo, Mich., watch its progress with much interest.

* * *

Shipping Pulpwood

The Thompson-Heyland Lumber Company, Limited, Toronto, are shipping from thirty to thirty-five cords of pulpwood a day in filling their contracts and have contracted to deliver during the present season 50,000 cords, a third of which will be poplar. The latter wood is exported to Tyrone, Penna.

* * *

Had Prosperous Year

According to the reports received at the annual meeting of the United Paper Mills, Limited, Spadina Avenue, Toronto, the company had a prosperous year. The company has been in existence for fifteen years and has a branch at Hamilton, Ont. The following officers were elected: President, R. I. Finlay; Vice-President, H. G. Finlay; secretary-treasurer, E. L. Young. G. W. Paul is the manager of the Hamilton branch.

* * *

You know what you've really got—sometime after you've paid over the money.—*Tree to Trade.*

NEW ENGLAND MARKETS ARE FIRMER

Talk of Impending Lockout in Norway Is Heard

CHEMICAL pulp markets in New England strengthened materially during the week and prices maintained a firm level. Talk of an impending lockout in Norway was heard, which helped the market despite failure of such a thing to materialize. The agreement among Swedish sulphite makers on export figures also had a stabilizing influence although good kraft pulp has been bringing a figure in excess of the 2.50 minimum established.

Higher prices are also being talked among American and Canadian pulp manufacturers. Standard sulphite and kraft pulps from Northern New Hampshire and Maine have been bringing 4.25 to 4.50 f. o. b. mill for bleached sulphite and 3.25 to 3.50 f. o. b. mill for kraft. German sulphite of writing paper quality brought 3.85 Boston docks while as high as 4.10 is asked for the choicest foreign lots.

Ground wood is weak. Some manufacturers have purchased at $28 to $30 per ton ex-docks but asking prices are about $32 and up. New England grinders are asking $35 to $38 mill.

Waste papers in mixed and news, are stronger but in book stock prices are easier. Sales of mixed at $15 and $15.50 on cars Boston are reported and news at $19 with a few at $19.50. Sales of book to Fitchburg have been made at $1.70 and $1.75 with a few ranging as high as $1.85 and $1.90. Mixed books range from $1.25 to $1.35.

Imports of waste, sulphite, kraft, etc., at Boston during the week are much heavier than for some weeks. Imports would indicate an improved condition in New England paper manufacturing.

* * *

Getting Data Together

The Dominion Government is procuring data on all the pulpwood exported through the various ports in Canada. Instructions have been received at Bridgeburg, Ont., from Ottawa, asking that figures be forwarded covering that port. It would appear as if the export of pulpwood shows a constant increase, comparing each month of the present year with the corresponding months of last year.

* * *

Hempstead Gives Talk

Frank Hempstead of the Eaton, Crane & Pike Company, Pittsfield, Mass., was a speaker before the Credit Grantors of the New England States in annual convention at the Copley Plaza, Boston, Feb. 14, his topic being "The credit sense—what it is—how developed—how useful in skillful credit management."

* * *

Plant Nearly Done

The new power plant of the American Tissue Mills at Holyoke, Mass., is rapidly nearing completion and it is expected that by another month it will be in operation. The structure is from plans by engineers McClintock & Craig of Springfield, Mass., and the Casper Ranger Construction Co., of Holyoke, have the general contract. The powerhouse is of brick and will cost, exclusive of equipment, about $35,000.

* * *

A BUSINESS GROWS because it is needed—it is usually successful in proportion to its effort to serve.

FORESTRY in the PAPER INDUSTRY

Conducted by J. R. Simmons, Secretary Forester, the New York State Forestry Association

SECRETARY WALLACE'S VIEWPOINT ON PAPER MANUFACTURE

Tries To Stimulate Paper Manufacturers To Conserve Pulpwood As Insurance For The Future—More Facts Given

ON the occasion of the conference at Washington, D. C., when Secretary of Agriculture Wallace called together the leading pulp and paper manufacturers for advice on a research program and for solution of forestry problems in pulp and paper manufacture, he embraced the opportunity to present his viewpoint on the general condition of the industry in America. A portion of what the Secretary had to say has gone out to the press under a caption which reminds us that the problem confronting the pulp and paper industry is serious. Mr. Wallace, however, did not call the pulp and paper men together merely to emphasize the seriousness of a situation, but rather to stimulate the paper man's powers at problem solution. It was intelligent curiosity, he says, that made paper and the paper machine; and this same intelligent curiosity must be ever more expertly directed to lead us through the complex maze of modern industrial civilization. That seems to be the subtle but very practical viewpoint contained in the Secretary's address, a portion of which we quote below:

Perhaps the pulp and paper industry is the first that has been brought face to face with the uncompromising truth. It can no longer leave to chance the supplying of its raw material. It can not easily follow, as the sawmill can follow, the retreating fringe of virgin forest. It cannot extract pulpwood from denuded and abandoned forests. It cannot rely on any known or probable substitute for the bulk of our paper. It cannot depend indefinitely on imports from foreign forests that are likewise dwindling under neglect and fierce competition. The supplying of pulpwood has become one of the outstanding problems of the industry.

Let us remember that the paper industry is only one of the many keen competitors for our diminishing supply of wood. We have less than one-third of our original timber stand left. For timber below saw timber size the drain on our forests exceeds by about three times renewal through growth. In saw timber the drain exceeds the renewal by 5½ times. This means not only heavily overdrawing our supply, but it means an ever sharper competition for the smaller timber on which we must rely after our old-growth forests are gone.

These outstanding facts—the enormous growth of our paper consumption, the dwindling of our raw material, and our dependence on foreign countries for pulpwood, pulp, and paper—these facts constitute at once a problem and an opportunity.

Serious as is the problem that confronts your industry, it has a decidedly promising side. In its raw material problem the paper industry is, in spite of present difficulties, peculiarly fortunate. In the first place; unlike coal or iron or oil or copper, wood grows from the soil. In the second place, the paper industry can use small, quickly grown, and therefore relatively cheap timber. Indeed, it will ultimately come to rely chiefly on thinnings and waste, the mere by-products of intensive timber growing and utilization. Once we fully abandon the old psychology of timber mining; once we renounce the doctrine of an ever-fiercer competition for an ever-diminishing raw material; once we pin our faith to the never-ending productivity of the soil, the paper industry can meet its needs and its opportunity.

I believe we shall ultimately conclude that we ought to be independent of foreign countries for paper. We have the land and the forest resources and the capital to develop an industry adequate to our needs. But besides growing timber and using without waste what we have, we shall, before we become self-supporting, have to spread the industry over a larger territory and use timber not now tapped for pulpwood.

The Department is urging action on various steps in the direction of forest management and better forest utilization. Most people who have studied the question agree, I believe, in urging the extension of public forests as the backbone of forest policy. An equally important step is good protection of all our forests—public and private—against fire. We have not yet learned to rightly appraise the role of fire as not merely destroying salable wood but, what is vastly more important, as destroying the future productivity of our forests. By removing the menace of fire we shall bring into play at least a part of the teeming power of our forest soil.

Basic to the whole program of future forest management is research—research in timber growing, research in timber utilization, and research in forest economics, including taxation. It is on this basic task of research that we desire to center your attention today. This modern world is impossible without research.

* * *

Lumbermen In Forestry

The appearance last week of O. M. Porter, secretary of the Woodlands Section of the American Paper and Pulp Association before the Noreteastern State Retail Lumberman's Association with a program for the promotion of forestry was one of several occasions on which retail lumbermen took up the forestry question. A similar discussion was a feature of the Michigan retail lumbermen's association, and a New York retailer, of Oneonta, N. Y., is using privately planted forests as advertisements for his business. His plantations are in the neighborhood of the old Cooperstown plantations, where large tracts of land, formerly used for wheat fields, were turned over to forestry, and where a group of Cooperstown business men have planted the Forest of a Dozen Dads. This latter forest is a cooperative planting, intended to grow a timber crop for the children of the planters. No person is eligible to belong to the company which is planting abandoned farms unless he can register as a father of a child under 10 years.

KELLOGG'S DEFINITION IS PLAIN ONE

He Says Trees Can Not Be Grown By Legislative Fiat

R. S. KELLOGG, President of the News Print Service Bureau, and Chairman of the National Forestry Program Committee, defines forestry as "the growing of successive timber crops." Insofar as a practical national forest policy is concerned, he declares, forestry is not a law requiring the planting of a tree for every one cut; (if we did as well as Nature herself, we would plant a thousand trees for every one that goes down); forestry is not a law giving mandatory control over private owners; forestry is not tree planting alone, nor fire prevention alone; neither, says Mr. Kellogg, can trees be grown by legislative fiat.

Of even greater interest, however, was that portion of Mr. Kellogg's address before the annual convention of the New York State Forestry Association which had to do with the history of the forestry movement. Reviews are always useful, and a resume of past experience in forestry will often demonstrate where authority and precedent may be found for the next step forward. Mr. Kellogg spoke without notes, but some of us who were present managed to get down the milestones of American forestry as fast as they were sited, and the following is the result. As we have said before in these columns,—thirty-five years ago forestry was not yet in our dictionary!

1891. Beginning of the National Forests, under President Harrison, and withdrawing of a portion of the timber-bearing lands by the Government. This move had been preceded by the early work of Dr. E. B. Fernow and his publications, including "The Economics of Forestry." Fernow was our first forester.

1897. Resignation of Fernow and coming of Pinchot.

1897-1910. Forestry promoted by Pinchot and by Theodore Roosevelt.

1898. Establishment of a School of Forestry at Cornell.

1900. Establishment of the Yale School of Forestry.

1905. Transfer of forestry from the department of Interior to the department of Agriculture, and establishment of the Forest Service,—an outstanding accomplishment.

1910. The Forest Experiment Station at Madison, Wis., and adoption of the principle that forestry means use.

1911. First appropriation for purchase of lands for public forests. The Weeks law, and co-operation between the National government and the states on a fifty-fifty basis.

1919. Beginning of conferences on a national forestry policy.

1920. The people unite in a common understanding and attempt to develop a national policy. The National Forestry Program Committee was organized at this time.

1921. The Snell bill, which offered a program but did not attempt to present a complete charter for action.

1923. The National Chamber of Commerce referendum. The Harrison resolution and formation of the U. S. Senate Committee on

Reforestation. Introduction of the McNary and Clarke bills in Congress.

There are now, says Mr. Kellogg, four phases of policy in process of development:

1. Prevention of forest fires.
2. Continued development of natural forests.
3. Forest planting and cooperation with individual owners of timberlands.
4. Classification of the remaining public lands.

He adds that we have a strong and reasonable program under way because most of the people concerned have agreed upon the main issues.

* * *

Red Spruce In Northeast

What can we expect from spruce in the Northwest? The answer to this question can at present only be approximated, despite the very great dependence upon red spruce on the part of the pulp and paper industry in New York and New England. So says the Forest Service, United States Department of Agriculture, in announcing the first steps of a comprehensive and exhaustive study of red spruce growth and yields under all the widely varying conditions of development in which it is found in this region.

The work of securing this information so essential for timberland owners, mill operators and the industry generally was started during the past summer by the Northeastern Forest Experiment Station, recently established at Amherst, Mass. Questions as to the cut to be expected from any given piece of land, 20, 30, and 40 years hence, or the land necessary to afford a permanent supply of raw material for a mill of any given capacity, are among those to which the Experiment Station will be in a position to give definite answers as the work progresses.

So far the study has been conducted only in various parts of Maine. During 1924, however, it will be extended to New Hampshire, New York and possibly Vermont, if present expectations materialize. Considerable complication in securing the desired facts and figures is anticipated because of the extensive nature of the study and the many contributing factors. The ravages of the spruce worm bud especially give great difficulty. This pest has not only destroyed tremendous quantities of fir and spruce timber during the past ten years, but has retarded the growth of those trees which have been able to resist the attacks.

Thus far hardly a spruce or fir has been found that has not shown a slowing down in growth as the result of partial defoliation by the bud worm.

* * *

Legislation in New York

Four bills looking toward encouraging the practice of forestry have been introduced in New York state, where forestry affects more paper mill and pulp mill owners than in any other state of the union. One bill proposes to encourage the reforestation of cut over land by exempting from assessment and taxation any forest growth planted after April 1, 1924. A conservation fund to consists of all money received by the Conservation Commission from any source, to be used for conservation purposes is the purpose of another bill. Such funds would strengthen the fire prevention force, and safeguard the forest more effectively than is the case at present.

* * *

Issue New Book

"Lumber And Its Uses" is the title of a book issued this month by the U. P. C. Book Co., New York. The authors, R. S. Kellogg and Franklin H. Smith, have had the co-operation of the Forest Service of the U. S. Department of Agriculture, as well as the expert advice of the leading lumber associations, and the edition has been prepared for the lumber expert as well as for the student.

WORKING PLANS FOR PULP COMPANIES

Forester Speaks on Forestry Directly from the Paper Mill

H. L. CHURCHILL, forester for the Finch, Pruyn Company of Glens Falls, N. Y., presented a valuable paper before the Society of American Forests, New York Section, at the winter meeting of the Society at Albany on February 6th. His subject was "What Constitutes a Practical Working Plan for a Lumber or Pulp Company in the Adirondacks?"

As a fundamental statement, Mr. Churchill says, that any important and successful business is, and must be, conducted along the lines of a carefully thought out and systematically arranged plan; each branch or department in a large organization has its own plan or plans through which it functions, but these are simply a part of the general plan and as such, each must be so arranged and so carried out that altogether the business will move forward on well oiled bearings, without halt and without unnecessary friction between connecting units; plans regulating logging and lumbering are no exception.

His definition of a working plan he quotes from T. S. Woolsey, "The plan under which a given forest property is to be continuously managed." He says that working plans are not a new feature, even in the United States, but that few of them have been followed by timberland owners over a long period of time for the reason that the plans have failed to fit in with those which have been responsible for the success of the other departments of the organization.

A practical working plan, according to Mr. Churchill, is one which will fit into the general working outline of the whole organization continuously, and at the same time leave the forest in the best condition possible at any time in the future; in other words, the plan must be one that will perpetuate both the forest and the industry.

"The field work must first determine boundaries, and then, with considerable accuracy the acreage and stand for each forest type. Areas in agricultural land, other cleared land, waste or barren areas, water areas and burns should all be determined by surveys where of any importance. Areas logged or partially logged, with dates of cutting, present stand and present rate of growth for each area and species that can be profitably logged now or in the near future should be computed with at least reasonable accuracy. When we have determined the quantity of material of various kinds in the present stand and what can be produced annually, that we think can be logged, manufactured and sold at a profit by the owners; when we have studied logging costs and methods and have determined upon necessary recommendations for better forest protection, we have reached the most difficult and important problem of all."

"How can these facts and figures be so presented to the management that they will be really seen and comprehended and be made to fit into and fill their proper place in the general business outline? Upon this point 'hang all the law and the prophets.'"

"Maps and diagrams, together with the summary of figures showing what the total present stand would produce in items now being manufactured or which may be manufactured in the future, together with the annual growth also expressed in these items, will, with a detailed logging schedule, form the essential part of a practical working plan so far as the management is concerned. Both foresters and owners should use every possible means to make the business permanent by getting their holdings on a sustained yield basis."

Forest Bill in Congress

Another forestry bill has been introduced into Congress, but it is devoted entirely to the taxation side of the question. The bill, sponsored by Congressman Keller of Minnesota, provides that a 1 per cent excise tax on bare lands be levied, and it is estimated that it would raise about $325,000,000 annually. The tax would be levied on lands valued in excess of $10,000, after deducting the following items:

1. Capital and labor values—all improvements and man-made structures under, on or over the surface.
2. All standing timber, whether naturally grown or planted.
3. All costs of clearing, draining and preparing the land for crops or other use.
4. All soil fertility which is placed at 50 per cent of the value of the bare land when used for agricultural purposes.

Standing timber is exempted on the ground that the growth of timber crops should be encouraged, and the bill points out that in the past the taxation methods have served the double purpose of prompting the early cutting of standing trees and preventing the planting of new ones.

* * *

Porter Speaks To Dealers

Co-operation of the retail lumber dealers of the northeastern states in the development of forestry was urged by O. M. Porter, secretary of the Woodlands Section of the American Paper and Pulp Association before the Northeastern Retail Lumberman's Association, at its New York City convention the week of Feb. 4. He told of the work done by the paper industry in developing forestry practice on paper company lands, and said that the lumber industry could well afford to participate in this movement. He pointed out that the national forestry legislation now pending at Washington was the developemnt of a Syracuse conference in 1919 at which the retail lumbermen participated with technical foresters and paper manufacturers in launching the campaign for a national forestry policy.

Mr. Porter stated that forestry requires the taking of adequate steps to prevent fires, and artificial reforestation will be necessary only to restock areas so heavily burned that natural reproduction is impossible; that proper forest management means the right application of forestry principles to secure a continuous production of timber, and that the program which the lumbermen might well adopt as their contribution to the forestry movement in the northeastern states includes:

1. Assistance in educational publicity for forestry by the securing of action from local chambers of commerce, and through the local press, public addresses and motion pictures.
2. Distribution of planting stock, now available from the various state forest nurseries.
3. Promotion of communal or town forests.
4. Co-operation with the various forestry associations.
5. Active support to the proponents of federal and state forestry legislation to encourage the growing of new forests to take the place of those that have been cut, and for the protection of the remaining stands of timber.

* * *

Hemlock Getting Scarce

Hemlock logs which were a few years ago only purchased by paper manufacturers are now being sawed into lumber. The lumber is used for interior work in residence buildings. The Hauptman steamer loaded with lumber for New York sailing from St. Helena, Oregon about the middle of February had on about 2,000,000 feet of hemlock lumber. The increasing demand for the hemlock logs may make the paper manufacturers pay higher prices for the hemlock they buy.

CONSTRUCTION NEWS

A Summary of Vital Facts Regarding Construction, Finances and Operation of Paper Mills

Nashville, Tenn.—The Old Hickory Paper Co., recently organized, has commenced the construction of its proposed new paper mill at Old Hickory, near Nashville, to consist of a number of units, with power facilities, estimated to cost in excess of $750,000, including equipment. Orders for a quantity of machinery have been placed and other contracts will be placed at an early date. John I. Beggs, Milwaukee, Wis., heads the company.

Little Falls, Minn.—The Itasca Paper Co., Grand Rapids, Mich., will construct its proposed local mill on a day-labor plan, and will break ground for the initial plant unit at an early date. The company recently acquired a tract of land and has commenced clearing the site. The Jacobson Engineering Co., 1645 Hennepin Avenue, Minneapolis, Minn., is engineer for the project. Robert Meyers is general manager.

Baltimore, Md.—The Oles Envelope Corporation, 514 East Lombard Street, has completed plans and will soon break ground for the erection of a new one-story addition to its plant, to be reinforced concrete, 80x250 ft., estimated to cost about $60,000. It will be located at Ridgely and Ostend Streets.

York, Pa.—The York Paper Mfg. Co., recently organized with a capital of $135-000, will operate a local plant for the manufacture of paper products for roofing and other building service. Charles and Jacob Lefean, York, heads the company.

Philadelphia, Pa.—The Corrugated Container Co., Sepviva and Venango Streets, has awarded a general contract t othe Robbins Contracting Co., 1137 Front Street, for the erection of its proposed new addition, consisting of a two-story structure, totaling about 17,000 sq. ft. of floor space, estimated to cost $30,000. William Lowenthal, 1208 Chestnut Street, is engineer.

Dayton, Ohio—In connection with its proposed new local plant, now under way, the Elam Paper Co., Marion, Ind., plans for the installation of equipment for a daily output of about 20,000 boxes of stationery and 125,000 tablets, as well as miscellaneous paper specialties. S. L. Elam is president, and L. P. Reiger, formerly of the Mead Paper Co., vice-president and treasurer.

Chicago, Ill.—W. H. Freund & Co., care of Burrett H. Stephens, 37 West Van Buren Street, architect, has taken bids on a general contract and will soon break ground for the construction of a new paper refinishing and label-manufacturing plant at 110 North Market Street. It will be one and two-story and basement, estimated to cost $50,000.

Downingtown, Pa.—The Shyrock Paper Co., plans for the immediate rebuilding of the portion of its mill at Dorlan, near Downingtown, destroyed by fire, Feb. 8, with considerable loss, exact amount not announced. The plant has been closed temporarily, since the time of the fire, and plans to resume at an early date.

Pottstown, Pa.—The Pottstown Paper Box Co., has acquired the local mill of the Aurora Knitting Mills, Inc., and will remodel and improve for a new plant. The present works will be removed to the new location and additional equipment installed.

Vancouver, B. C.—The Independent Tar & Asphalt Co., recently organized to manufacture roofing papers, etc., has awarded a general contract to Harrison & Lamond, Pacific Building, for the construction of its proposed new plant on site selected on Granville Island. It will cost close to $70,000.

New Companies

Los Angeles, Cal. The Sunset Paper Mills, Inc., has been incorporated with a capital of $500,000, to operate a local paper mill. The incorporators are Charles Gordon, San Francisco, Cal.; M. C. Cooper, Peter C. and Ralph W. Brown, Los Angeles. The company is represented by L. R. Wharton, 320 A. G. Bartlett Building, Los Angeles.

New York, N. Y.—The Drinihausen & Hollkott Paper Co., has been incorporated with a nominal capital of $5,000, to manufacture and deal in paper products. The incorporators are S. Bacharach, A. B. Brenner and J. H. Keim The company is represented by Van-Vorst, Siegel & Smith, 25 Broad Street, New York.

Plainfield, N. J.—The National Wall Paper Co., 109 Watchung Avenue, organized, to deal in wall paper, etc. Irving Eisenstein, 25 Monmouth Street, Newark, N. J., heads the company.

Wilmington, Del.—The Sisler Paper Co., has been incorporated with a capital of $100,000, to manufacture paper products. The incorporators are Charles T. Harris, George W. Westcott, and Perlee C. Sisler, Wilmington. The last noted is representative.

Providence, R. I—The Narragansett Card & Paper Co., 131 Washington Street, has filed notice of organization to manufacture and deal in cardboard and paper products. Harry L. LeMay heads the company.

Pittsburgh, Pa.—The Iroquois Paper Co., has been incorporated under Delaware laws with capital of $10,000, to manufacture and deal in paper products. The incorporators are David M. Harrison, A. Frederick and Edward Huttinger, Jr., Pittsburgh. The company is represented by the Capital Trust Co. of Delaware, Dover, Del.

New York, N. Y.—The Master Paper Box Co., has been incorporated with a capital of $5,000, to manufacture paper boxes and containers. The incorporators are B. Segal and F. Lipman. The company is represented by C. J. Lipman, 74 Delancey Street, New York.

Wilmington, Del.—The Reinforced Paper Products Corporation has been incorporated with a capital of $1,000,000, to manufacture paper bags and other containers. The company is represented by the Corporation Trust Co. of America, du Pont Building.

Financial

Kalamazoo, Mich.—The Sutherland Paper Co., has voted to retire outstanding bonds to the amount of $60,000 on March 1. The bonds are a portion of an original issue of $300,000, dated 1920, and of which $50,000 prevously has been retired.

Rochester, N. Y.—The Corona Paper Box Co. has filed notice of dissolution under state laws.

Plant Operations

Kalamazoo, Mich.—The Rex Paper Co., is operating at regular capacity at its local mill, giving employment to a full working force. During the past year the company has advanced production at the plant about 20 per cent, with the installation of additional equipment, including a new automatic control drying system.

Tomahawk, Wis.—The Tomahawk Kraft Paper Co., is making ready to commence operations at its new local mill, comprising a former plant used for the production of catalog papers. It will be devoted to kraft stock exclusively in the future, and it is expected to develop maximum output at an early date, with employment of full working force.

Biron, Wis.—The Consolidated Water Power & Paper Co., is running full at its Biron plant, near Wisconsin Rapids, using a new machine for the production of newsprint, recently installed. The unit has been speeded up to a rate of 850 ft. per minute, being only second to the machine at the Wisconsin Rapids plant of the company, which is making newsprint at the rate of about 1,000 ft. per minute. With three machines at the Biron mill, three at the Stevens Point plant and four at the Wisconsin Rapids plant, the company has a rated capacity of approximately 400 tons per day, and plans to maintain operations on this basis for some time to come.

San Francisco, Cal.—The Paraffine Companies, Inc., has adopted a plan to give vacations to all employes at its local mills and branch plants at Emeryville and Antioch, Cal., of three or more years service record with the organization, with full pay during the absence. About 1,000 operatives will be affected, of which approximately 200 are eligible at once for the vacation periods. All workers in the employ of the company for 5 years and over, will be granted a leave of absence for 2 weeks; for 4 years, and less than 5 years, 10 days will be given; and for 3 years standing, 1 week with pay will be granted.

NEWS FROM CANADA

PREDICTS END OF PULPWOOD SOON

G. P. Tweed Claims Wood Resources Are Not as Large as Generally Thought

THE Montreal sittings of the Canadian Pulp Wood Commission were quite interesting. At first witnesses were a bit slow in making an appearance, but gradually they came along in goodly numbers.

G. P. Tweed, a pulp wood dealer of Montreal, testifying said that Canada's pulp wood resources were not nearly as large as had been generally thought, and he believed that they would be exhausted within twenty years. In his opinion it would make very little difference whether an embargo was put into effect, in so far as preserving the forests was concerned; for if wood were not cut for Americans it would be cut for home users, and the result would be the same. Eight years ago the Abitibi district was covered with forests. Today in some counties the wood had gone as far as the eye can reach. Some of this had gone to home mills, but the greater part of it had been sold to those in New York and Pennsylvania. If the settlers had not been able to export it they would not have had anything. At the present time there was an over-production of wood and it could be bought quite cheaply.

E. Martineau, another Montreal business man, said that if the embargo was put into effect the settlers would have to go elsewhere to make a livelihood. This meant that they probably would leave the country. If an embargo were wise it should have been put into effect ten years ago before settlers became so dependent on the sale of pulpwood as they are today.

H. C. Thayer, manager of manufacturing for the Hollingsworth Whitney Company of Boston said that his company had acquired 287,000 acres of freehold timber lands in Nova Scotia and 56,000 acres in New Brunswick. A Canadian embargo would mean that pulpwood would be imported into the United States from northern Europe, where supplies were large.

John Tregget of Finch & Pruyn, Glen's Falls, N. Y., said that the placing of an embargo on exports of pulpwood would mean a loss to his firm of 15,000 cords a year and would mean a hardship to 350 men employed on their holdings in Lotbiniere country.

T. Prefontaine, lumber and pulpwood dealer of Montreal, said that the market had been very unsatisfactory since 1921. An embargo would mean, not only the cessation of wood cutting by farmers, but of long timber as well.

The testimony of both settlers and pulpwood dealers was to the effect that when the demand for pulpwood fell off from the United States the price dropped, and they had no confidence in the opinion that with the United States market closed, the Canadian mills would pay as much for their supplies.

* * *

To Start Work

Hon. T. D. Parullo, Minister of Lands in British Columbia, announces that a start will be made this year on the proposed $10,000,000 pulp and paper plant near Prince George in that province. This, it is said, is due to the fact that an understanding has been arrived at between the provincial government and the promoters. The provincial authorities have been very eager to get this enterprise under way, and with a view to getting differences of opinion straightened out, Mr. Patullo recently spent some time in Montreal. It is understood that the project is strongly backed by Canadian and British capital, and that it controls some thousands of miles of pulpwood along the upper reaches of the Fraser River.

Season Was Good

A. E. Wicks, of the Hawk Lumber Company, Monteith, Ont., says that the season has been exceptionally good from the standpoint of weather and other operating conditions in Northern Ontario for the production of pulpwood and ties. The output will be about the same as last year. Prices on the whole, he says, are a good deal firmer. The demand is not exactly keen but sales are being made at prices that assure a reasonable profit. The proposed embargo does not seem to have any effect on the demand for wood nor upon those parties it would vitally affect. Mr. Wicks says: "The popular opinion is that the Government will not put such a measure into force as it would have disastrous results on at least a number of localities. If exportation were prohibited off patented lands, especially as regards had-peeles spruce and poplar, it would have a serious effect upon settlers and farmers as there is no market in Canada for poplar except in very small quantities."

* * *

Form New Firm

The G. A. Grier & Herron Lumber Company, Ltd., of Toronto, has been organized with an authorized capital of $500,000 to manufacture and deal in lumber and pulpwood. The organizatoin, which has been granted an Ontario charter, is composed of George W. Grier, of Montreal, and Percy Herron, of Webwood, Ont., and has been formed to conduct an operation on a limit near Brennan Harbor, Ont.

* * *

Mills Closed Down

The mills of the Chicoutimi Pulp and Paper Company in the Saguenay district, Quebec, have been closed down for over a week owing to the lack of water. There are only a few employees which have been kept on the staff. It is stated that operations will not be resumed until early in April. In previous years the company always did keep a few men but this year, due to the present conditions it was thought advisable not to operate. It is practically decided that the Chicoutimi Pulp will reorganize itself since the Price interests have changed their views for the time being. Such is not the case of the Bay Sulphite, which will probably be the object of pour-parlers with Sir William upon his return from Europe.

* * *

A Fine Line

Collett & Sproule, paper box manufacturers, Lombard Street, Toronto, have just turned out a very fine line of papeteries for Warwick Brothers and Rutter, Toronto, who will exhibit them in connection with the paper display to be made by Canadian paper firms at the British Empire Exposition which opens at Wembley Park, England, in April. There are ten different styles out of a total of 250 different styles the company have designed and manufactured.

* * *

Creditors Meet

Creditors of S. L. Davison & Hughes Engraving and Lithographing Company, Limited, Toronto, met in that city a few days ago, following an assignment to N. L. Martin. A number of Toronto paper houses are creditors for considerable amounts. A statement presented showed a nominal surplus of assets over liabilities of over $26,000. It is not known whether or not the firm will continue in business.

* * *

Charles Russ, general superintendent of the Montrose and St. Lawrence Divisions of the Provincial Paper Mills, Limited, and Mrs. Buss, have left for St. Petersburg, Florida, where they will spend the balance of the winter.

McArthur Speaks

At the recent Winnipeg sitting of the Canadian Pulp Wood Commission a representative of J. D. McArthur, the noted railway contractor who is the guiding hand behind the proposed Manitoba Pulp and Paper Co.'s big plant near Fort Alexander, Man., declared that financial interests represented that it would be impossible to put over this industry unless an embargo were placed on exports of pulpwood. It was contended that the mill would take all the pulpwood produced in the province, and that as good or better prices as are being received, would be paid to the settlers. The latter, however, could not see it that way.

* * *

Against Government

It is stated from Ottawa that the great volume of evidence taken before the Royal Commission inquiring into the export of pulpwood from Canada is so far adverse to any Government measure of prohibition. The inquiry is not yet concluded. In order that a report be made Parliament in the coming session the commission is dividing. W. A. Austie, deputy chairman; Commissioner Sutherland and Secretary Finlayson going to the west, and Messrs. Pacard, McLellan and Kerr continuing the investigation in Quebec. The western section will meet in Winnipeg, on February 12 and will afterwards visit Saskatchewan and British Columbia.

* * *

Complete Additions

The Ashwaak Pulp and Paper Company of St. Johns, N. B., of which Howard E. Beedy is vice-president, have completed changes and additions to their plant and during the present month they expect to have the second drying machine in operation which will materially increase their output. The mill is running to capacity at the present time and no difficulty is being experienced in disposing of the production of bleached sulphite. The company is also conducting extensive pulpwood and timber operations in the bush.

* * *

Read Fine Reports

At the annual meeting of the Ratcliffe Paper Company, York Street, Toronto, last week, satisfactory reports were read concerning the operations of the company during the past year. The company had a very successful twelve months and are looking forward to a good record this year. Fred L. Ratcliff was elected president, T. E. Gain, vice-president and Norman J. Ratcliff, secretary.

* * *

Business Progressing

Hinde & Dauch Company of Canda, Limited, which operates a large board mill in Toronto, held their annual meeting in that city a few days ago when satisfactory reports of the years' business were presented. It was shown that despite the vagaries of business during 1923 the company had a good business year. The plant is fairly busy at the present time on wall board, container board and fiber and corrugated boxes. The following officers were elected: president, Sidney Froham, Sandusky, Ohio; vice-president, Ralph King, Toronto; secretary, R. K. Ramsay, Sandusky; treasurer, J. Watt, Toronto; assistant secretary, T. E. Lloyd, Toronto; general manager, O. H. Moore.

* * *

McArthur Resigns

It was announced last week in Toronto that James McArthur, general manager of the British American Wax Paper Company, Limited, Carlaw Avenue, Toronto, had resigned his position with the organization. Mr. McArthur has been connected with the company for some years and is widely known in the paper trade.

Assets Are Sold

All the assets of Clark Brothers, Limited, were sold at Annapolis Royal, N. S., on a Supreme Court order, to the Bear River Pulp Company, Liimted, a new company, representing Chicago, New York and other interests. The purchase price included, according to the order of the court $200,000 in cash and securities in the new company, having a total par value of $1,300,000. C. W. Rantoul, of New York, will be general manager of the new company, and is expected to arrive at Bear River shortly.

* * *

Brompton Adds to Production

Despite the two or three months of poor kraft business which closed the year 1923, the Brompton Paper Company, with mills at East Angus and Brompton, Que., the company added, aided materially by its daily output of 110 tons of newsprint, closed the year with a good showing, with, as near as can be gathered, something over $2,500,000 working capital, and with a showing of about seven per cent on the common stock, after cleaning up arrears on preferred. The turn of the year saw no immediate improvement in the kraft market but about three weeks ago the market for this class of paper underwent a favorable change.

Some European manufacturers who had been dumping goods at profitless prices have had to suspend operations, it is said.

* * *

Price War Raging

While a price war is raging in the sales book industry in Canada, this is not expected to interfere with the earnings of F. N. Burt, Limited. The chief business of F. N. Burt, Limited, is the manufacture of paper boxes, and the three big buffalo plants are entirely devoted to paper box manufacturing. In Canada, the Dominion Paper Box subsidiary is the most important unit, and, while merchants' counter check books are manufactured for the Canadian trade by the Burt Company, the total sales of this product represent only about five per cent of the company's total production. An idea of the extent of the competition in sales books in Canada is given in the announcement of one of the companies that it has reduced its price by about sixty-six and two-third per cent. and that prices may be still further reduced.

* * *

Granted a Charter

The Temagami Timber Company, Limited, with head office in Toronto, has been granted an Ontario charter, with an authorized capital of $100,000. The charter empowers the company to engage in business as timber and pulpwood operators.

* * *

Get Good Contract

The Thunder Bay Pulp and Paper Company, operating a pulp mill on the North Port Arthur waterfront, has given a contract for the construction of a dock of 252 feet frontage, with 500 feet of trestle work, to the Thunder Bay Harbor Improvement Company. The work will be proceeded with in the spring.

* * *

Winlow in the Harness

Following several weeks in hospital as a result of injuries received in a railway wreck at Belleville, Ont., George C. Winlow, Toronto, sales manager for the Lincoln Paper Mills Company, Limited, has resumed his duties and his many friends in the paper trade were pleased to greet him in Toronto last week.

Paper and Board

New York, February 19.—Reports almost without exception tell of a steadier tone in the paper market—steadier as regards the level of quoted prices and steadier as concerns the develop-result of the limited call for supplies from consumers and the paper which for a time showed a weakening price trend as a result of the limited call for supplied from consumers and the pressure of manufacturers to market their product appear to have become better stabilized at the lower price levels reached during the declining movement, and the market as a whole seems characterized by a healthier condition and by at least gradually broadening activity.

The situation in coarse papers especially presents this improvement. The decline in wrapping paper prices appears to have been definitely checked, and the market for this class of paper is steadier than it has been in several months or ever since the downtrend set in around the outset of the year. Producers seem bent on securing the prices quoted on wrapping papers and are not exerting the pressure on the market that they were, with the result buyers are finding it necessary to meet the prices named to cover their needs. This condition is due largely to the fact that prices of wrapping paper were permitted to work down to levels where very little or no profit was afforded manufacturers in producing such paper, and, as is usually the case in such a market, a reaction has set in and the tendency of prices now is upward instead of downward.

No. 1 domestic all-sulphate wrapping is quoted in most quarters at 6.25 cents per pound f.o.b. New York. In some cases sales down to 6 cents are recorded, but most mills are insisting on this latter price f.o.b. shipping points, thereby bringing the f.o.b. New York basis around 6.25 cents. Manufacturers in the South are reported selling kraft wrapping at as low as 5 cents f.o.b. mills but it is contended that this paper does not compare in quality with other No. 1 domestic kraft.

No. 1 jute is quoted at around 9.25 cents a pound f.o.b. New York, and No. 1 manila wrapping at 5.25 to 5.50 cents New York. Various quotations on these papers are named, depending, of course, on the quality and tonnage, but prices of coarse papers, on the whole, display a great deal more steadiness. Demand is developing in fair volume though jobbers and mill agents still complain of the rather small lots individual buyers are interested in.

Tissue papers are out of season at present and there is not much activity in this branch of the industry. No. 1 white tissue is quoted at 75 to 80 cents a ream f.o.b. New York, and No. 1 manila and No. 2 white at 70 to 75 cents a ream. Toilet tissue

GOOD PAPER
—GOOD RESULTS

The effectiveness and pulling power of Direct Mail literature depends entirely on the proper selection of Paper. The finest illustrations possible or the best copy cannot get your message across if produced on paper that cannot stand the strain.

FRANKFOLD Enamel

a paper built for a purpose, will answer the requirements unusually well. The extra long, firmly knitted fibres assure good folding qualities and a required sturdiness. The beautiful and uniformly smooth surface will faithfully reproduce the sharp details of mechanical subjects or the subtle shades of color work.

FRANKFOLD ENAMEL preserves that freshness and inviting appeal so essential to successful direct-mail literature.

We will gladly forward some printed specimens or blank sheets for dummy purposes.

APPLETON WIRE WORKS

EMPIRE SIZE AND CHEMICAL CORP.
Rosin Size — Foam Killer
Felt Soap
ALBANY, N. Y.

in jumbo rolls is priced at about 7 cents per pound f.o.b. New York.

Newsprint continues firm in price and in good movement from mills to publishing centres. Newspapers in New York are printing unusually large issues almost every day, and the Sunday issues are running close to the record in size. Publishers throughout the country are using newsprint in heavy tonnage. As an example, a copy of a Sunday issue of a newspaper in a comparatively small Southern town—a town having a population of only about 40,000—was received several days ago and was found to have 84 pages, which is illustrative of the big consumption of print paper all over the country.

Book paper manufacturers report fair activity in their market though this class of paper is still lagging behind in demand somewhat in comparison with others. Prices are fairly steady but it is no secret that some concessions are still being allowed printers and publishers, particularly when large tonnage is involved.

Boards are in limited demand and rather irregular and unsettled in price. Mills are vying with one another in an attempt to catch all the business they can, and prices are being shaved in cases. Chip board is quoted at $42.50 per ton f.o.b. New York, and news board at $45 New York.

Mechanical Pulp

Quotations on mechanical pulp are maintained and the tone seems somewhat steadier than it was. Domestic manufacturers are quoting between $35 and $40 a ton f.o.b. pulp mills for ground wood for prompt shipment, and indications point to most of them finding an outlet for the bulk of supply they have to dispose of while unfavorable weather conditions in some localities have reduced production which tends to strengthen the statistical position of the market. Demand is reported developing in fair volume. Consumers are buying in a cautious manner, chiefly against direct requirements, but this is the time of the year when output is partially curtailed at least, and this has a sustaining influence on the market. Canadian producers are quoting on a relative level with domestic ground wood prices, quotations depending largely on the freight to consuming points.

Foreign and Domestic Chemical Pulp

Probably the most important development in chemical pulp is the firmer tone in prices of kraft pulp. Importers in general are asking a minimum of 2.50 cents a pound ex dock New York for No. 1 Swedish kraft, and quotations frequently are a dollar or two per ton above this level. It is asserted that manufacturers in Sweden have reorganized their association, taking in only the producers of sulphate, and have fixed minimum prices which figure out at 2.50 cents on the dock at New York or other American Atlantic ports, thus accounting for the increased firmness in prices of kraft.

Sulphite is irregularly quoted, and prices are on a wide range. Bleached sulphite is selling anywheres from 3.50 cents a pound ex dock New York to 4.25 cents, depending on the quality, while domestic bleached sulphite is quoted from 4 to 4.50 cents per pound f.o.b. pulp mills, with some secondary grades available down to 3.75 cents. Importers mostly ask 2.60 and 2.65 cents ex dock for strong foreign unbleached sulphite. Bleached soda pulp is quoted at 3.50 to 3.75 cents per pound at pulp plants. Quotations ex dock New York and f.o.b. pulp mills are as follows:

Sulphite foreign—			
Bleached No. 1	3.75	@	4.25
Unbleached No. 1	2.60	@	2.80
Unbleached No. 2	2.40	@	2.60

Domestic Rags

Prices of papermaking rags are still advancing at a rapid clip, and market levels of many grades are now higher than have been reached since the war period. Low grades are especially strong in price and are actively sought by mills, and the medium grades also are moving in comparatively large amounts and have scored additional advancement. No. 1 roofing stock is quoted at close to 3 cents a pound f.o.b. New York. Sales at 2.90 cents have been recorded and dealers as a rule are intent on receiving prices above this, while No. 2 sacking is selling at 2.60 to 2.75 cents per pound f.o.b. New York. Thirds and blues have risen rapidly in price until most dealers quote 3.50 to 3.75 cents a pound New York for repacked and 3 to 3.25 cents for miscellaneous packing. Old white rags are firm and advancing, and new cuttings also are moving upward in value. What actually constitutes a boom exists in rags, and as yet there has been no evidence of any reaction in a downward direction. Quotations f.o.b. New York are:

New Shirt Cuttings, No. 1	14.00	@	14.50	Overall Cuttings, Blue	9.25	@	9.50
No. 2	6.75	@	7.00	Washables	5.50	@	5.75

				Roofing Rags, No. 2	2.60	@	2.75

Imported Rags

Foreign papermaking rags are strong in price and in brisk demand. Dark colored cottons have sold at 2.60 cents per pound ex dock New York to roofing paper mills, while blue cottons are fetching 4 cents a pound and higher on the dock. All grades are sharing in the activity and in the upward price movement, and importers put much stress on the small volume of offerings from abroad and the high prices primary shippers demand. Prices ex dock New York are as follows:

Lins., White, No. 1	13.50	@	14.00	German Linen, blue	5.00	@	5.50
Ger. Blue Cottons	3.50	@	3.75	German Linen, grey	6.50	@	7.00
French Light Blues	3.75	@	4.00	German S. P. F.'s	6.00	@	9.00
New Light Prints	6.50	@	7.00	German Light Prints	4.25	@	4.50
New Unbleached	10.50	@	11.00	Dk. Colored Cottons	2.60	@	2.75

Bagging, Rope, Etc.

The feature in bagging is the sharp advance in the value of roofing bagging. Sales of this material at 1.70 to 1.80 cents a pound f.o.b. New York have been reported, and dealers are not grading No. 1 scrap bagging but are disposing of such stock to roofing paper mills. Old rope is firm and moving in a steady way. Domestic manila rope quotations range between 6.50 and 6.75 cents a pound at shipping points, and foreign manila rope from 6.25 to 6.50 cents ex dock New York.,Quotations on a f.o.b. New York basis are:

Gunny No. 1	1.50	@	1.60	Roofing Bagging	1.60	@	1.70
Foreign	1.40	@	1.50	For. Manila Rope	6.25	@	6.50

Wool Tares, heavy	1.60	@	1.75	Mixed Strings	1.15	@	1.30
Scrap Bagg. No. 1	1.65	@	1.75				

Old Paper

Old paper prices seem to be holding their own without developing any broad changes. The low grades are in proportionately better demand than the high qualities though the call for supplies from mills does not seem of heavy enough volume to materially disturb values. Folded newspapers are selling at 95 cents to $1 a hundred pounds f.o.b. New York, and No. 1 mixed papers at 75 to 80 cents New York. Old kraft paper is firm at 2.25 cents per pound f.o.b. this city, and flat magazine stock is bringing 1.60 to 1.75 cents a pound New York. Shavings are quiet with some little movement of No. 1 soft white at about a price level of 2.90 to 3 cents a pound New York. F.o.b. New York prices are:

No. 1 Hard White Shavings	3.65	@	3.85	Ledger Stock	1.85	@	2.00
No. 2 Hard White Shavings	3.20	@	3.40	Kraft, No. 1	2.25	@	2.35

				White Blank News	2.25	@	2.35
				Common Paper	.55	@	.60

Twines

The twine market is moderatively active. Consumers and dealers alike are purchasing in a careful manner principally to cover immediate needs, and manufacturers generaly are operating on a curtailed scale. Strength in raw material makes for firmness in prices, and twine quotations are well maintained at the following levels:

Sisal Hay, pure	12.25	@	13.25	Jute Wrapping twine, A grade	20.00	@	
Manila Hay, pure	16.25	@	17.25	Papermakers Twine	11.50	@	
Sisal Lath Yarn	12.25	@	13.25	B. C. Hemp, 18	.39	@	.40
Manila Rope, pure, ¾ inch diameter	14.25	@	15.25	B. C. Hemp, 24	.38	@	.39
Hardware Rope	11.25	@	12.25	B. C. Hemp, 36	.37	@	.38
Jute rope, ¼ diam. and over, coils	14.00	@	15.00	America Light India— No. 6	14.50	@	
Sail twine, A grade	20.00	@		No. 7	13.50	@	

Chemicals

No changes of importance are reported in prices of paper-making chemicals. There is a fair movement of most commodities though the bulk of it is against contracts, with new business developing rather slowly.

IMPORTS AT NEW YORK

Week of February 11-16

Woodpulp and Forestry Problems

(Continued from page 19)

Mr. Kellogg declares it is a paper age in which we live, and he asks us to stop and reflect what it would mean to our civilization if every printed or other record were to be obliterated. Paper is a manufactured product consisting wholly of wood, and, as he says in another part of the volume, "we can no more conceive of a state of society on this continent with wood totally eliminated than we can of one in which iron has no part." The moral is, grow more wood!

Kellogg's *Pulpwood and Wood Pulp in North America* will undoubtedly take its place without loss of time as a standard authority and reference on woodpulp and timber production. A copy of it should find a place in every public library in the United States and means should be provided to put one in the hands of every Congressman and every Senator who represents the people at Washington.

In addition to carefully executed graphs and curves, the book abounds in engravings from photographs, there being some fifty-seven of them interspersed among the text. The aggressive figure of the author can be seen in a picture on page 109, where two massive logs of Douglas fir are shown, the scene being somewhere in the State of Washington.

It remains to state that the volume is published by McGraw-Hill Book Company, Inc., at $4.00 a copy and orders will be filled on receipt of price by the Hughes Publishing Company, 1478 Broadway, New York.

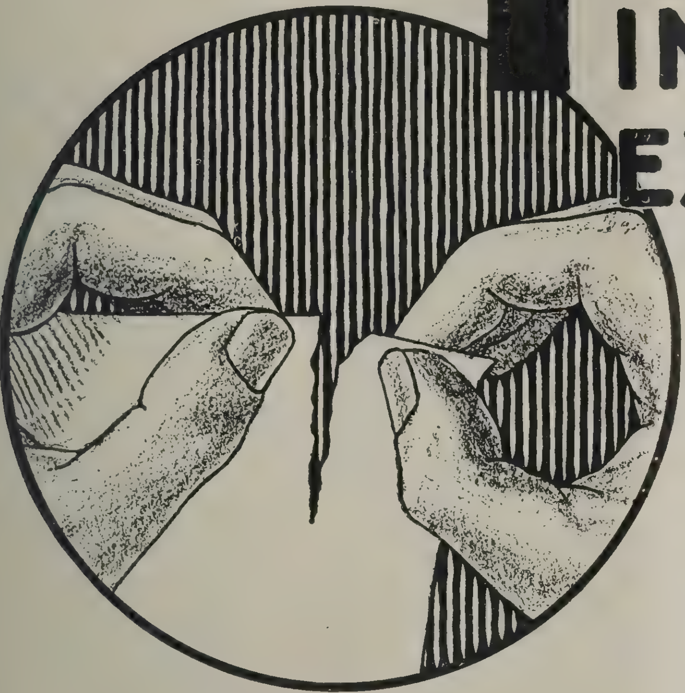
The Second Annual PAPER INDUSTRIES EXPOSITION



IF you knew ALL about paper making—your income tax would probably "choke an elephant". But no one man can ever know it all. However, the Paper Exposition projects all the knowledge that has been gained by thousands as on a screen so you may gather quickly the things which will benefit you particularly.

Remember the TIME and the PLACE.

Grand Central Palace
New York City
Week of April 7th

EXHIBIT spaces are being taken rapidly. Has your sales department selected yours yet? If not, write NOW for diagram and costs of spaces.

The Paper Exposition will be on the Main Floor of the Grand Central Palace this year.

One trade paper wrote about last year's Exposition: "The various booths devoted to machinery and apparatus, mill supplies and equipment had a full quota of interested visitors all eager to see or be told about the latest thing in the mechanics of screening, slicing and pumping; the filtration of water, sedimentation and recovery of waste, or perhaps the best method of making rosin size. For the engineer, superintendents or the technical man in a pulp or paper mill some of the exhibitors gave continuous demonstrations of the operations of various modern inventions."

No matter how much you know about paper—or how successful you are—you can get useful and helpful information from the various exhibits and lectures. It will pay you to have all your department heads, as well as yourself, spend one or several days at this Exposition.

Paper Industries Exposition, Grand Central Palace, New York

ORR FELTS and JACKETS
Lowest Cost per Ton

If you judge felt values, not by what you put into the equipment, but what you get out of it—then you will specify ORR 3 stripe Endless Felts for ORR felts will produce the lowest cost per ton. They "stand up" under severe usage. Orr durability is acknowledged everywhere. Their strength and long life are as dependable as their reliability and quality.

In the 32 grades of Felts and Jackets we can match your most exacting demands. Tell us the kind of paper you desire to make, and we will send you samples of felts that will economically serve you and help you to produce paper at lowest cost per ton.

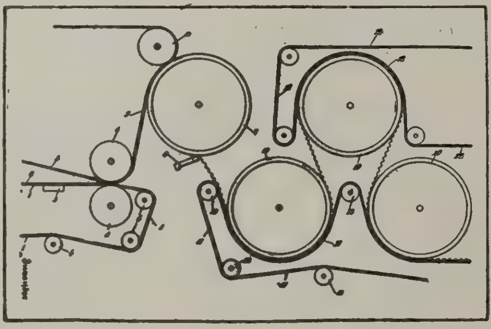
Improved Process of Creping Paper

The Best and Most Profitable

For the manufacture of CREPED PAPER Napkins, Toweling or Stretchable Bag Papers and Creped Packing or Crepe Wrapping Papers the system has no equal

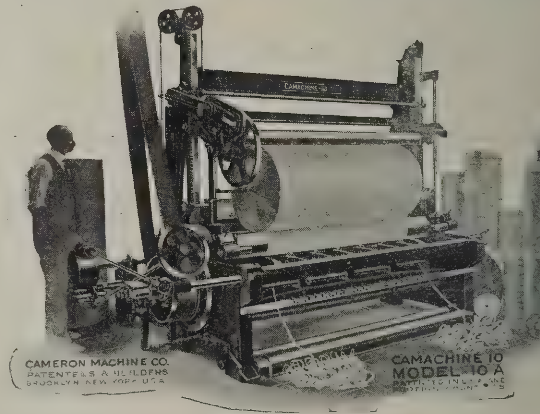


The crepe being formed while the fibres are steaming hot and pliable is dried without stretching; not only retaining form better, but shedding less lint than cold creped paper products.

For particulars address:

Tompkins-Hawley-Fuller Co.
VALATIE, N. Y., or OREGON CITY, ORE.

UNIVERSAL



Of universal application to the needs of wholesale paper warehouses, paper dealers, paper converting plants and paper mill finishing rooms is CAMACHINE Universal Type 10 Model 10A, illustrated here. This machine is built in widths 42", 52", 62", 72" and 82" and will wind rolls to a maximum diameter of 36". Descriptive literature covering this and others of the complete line of Camachines, which cover every roll requirement, will be sent on request.

PAPER

February 28, 1924

The Magazine of the Paper Industry

RUSSELL C. HUGHES, Publisher

THOMAS J. KEENAN, F.C.S., Technical Editor

ISMAR GINSBERG, B.S., Contributing Editor

A Few Stray Thoughts

THE proposed Canadian embargo on pulpwood continues to be the topic of the hour in the paper industry, as February—even with its 29th —fades into nothingness.

The Royal Commission on Pulpwood is gathering all kinds of evidence in Montreal, both for and against the embargo and the unbiased observer is still left all at sea. It is impossible to forecast which way the cat will jump and just to what extent it will jump, if it does jump.

It seems best to stop, look and listen and pray to God for the best.

* * *

Don't skip the article by Warren B. Bullock on "Imports and Exports" in this issue. Mr. Bullock handles the subject in a cold, dispassionate manner that kills argument at its birth. There is much to be said on this subject. We will be glad for some of our readers to say some of it. With the trade balance steadily growing worse, despite the fact that the United States Industry is doing a fair business, it is high time to look the facts in the face and upon them to base the action for the future.

The clear cut statistics in both Mr. Bullock's article and the summary of imports and exports, warrant a careful analysis. They are figures, but they can be made warm, palpitating, life-like things if they are studied and give the real message. That message is in the comparison of 1923 and 1922. Then you wonder what 1924 will bring.

* * *

Read also the profound discussion of Thomas J. Keenan on cellulose in this issue. He handles a tricky, peculiar subject in a masterly fashion.

Can't you yet feel that little easing up in the paper situation? Can you feel a greater firmness in the market? It is there. The conditions ARE improving. Almost everybody is saying so and we feel compelled to take their word. It isn't going to be a bad year, despite the prices of paper brought in from abroad. So cheer up and get busy.

* * *

The paper industry is like unto no other in the world. Here we offer $5 each for good jokes on men in the paper industry and the response—instead of being overwhelming as it should be—is poor. The industry is crowded with little human interest stories that sparkle forth from the humdrum of work and yet it seems impossible to secure them. Isn't $5 for a few lines a sufficient inducement?

* * *

The same condition applies to the Salesmen's Forum. This is little save free advertising and yet it appears that nobody wants to take advantage of it. There are responses but the responses are slow. They should come pouring in like a flood.

But then, there is only one paper industry.

* * *

The death of David G. Garabrant removes a splendid figure from the paper industry. A huge throng of friends in the industry will mourn his passing. He saw things in a big, constructive way, and brought progress to the entire industry. He was in the business from 1864 to his death a few days ago. His death removes another well known and well liked face from ranks of the trade.

* * *

The best way to end a page at this season of the year is to again remind the industry that the annual convention of the American Paper and Pulp Association will take place in the week beginning April 7, with headquarters at the Waldorf. The annual Paper Industries Exposition will be at the Grand Central Palace. And the page is ended.

PAPER

The Magazine of the Paper Industry

Imports and Exports

Under the above caption, PAPER will conduct a discussion of the basic troubles of the paper industry in America. The opening article is a conservative statement of facts by Warren B. Bullock, of the American Paper and Pulp Association. He of course looks at the matter from the Association viewpoint, and in his measured words he presents a picture of the entire import and export situation that is comprehensive. There are many more phases and facts than those presented in this article. Paper wants to go to the bottom of the matter and throw light everywhere, whether it exposes an amazing situation or only what can be expected. It will, moreover, present both sides impartially. It will be glad for any expression of opinion from its readers.

By WARREN B. BULLOCK

American Paper & Pulp Association

GOVERNMENTAL figures on imports of paper for 1923, just made public, are an explanation f one reason why the paper industry f the United States, despite almost ecord production, ended the twelve ionths with an uncomfortable nar- ow margin of profit for the year's perations.

Total imports for the year, meas- red in value, and given in detail at ie close of this article, were the ighest in the nation's history, reach- ig a total of $16,137,795 as against ie previous year's import total of 35,854,357. Even eliminating the early $26,000,000 increase in news- rint imports, there is still a margin f increase of over $5,000,000 in the olume of imports of other grades, hile total exports increased only a illion and a half dollars. An actual ecrease in exports of fine, bag and ewsprint was reported, as compared ith 1922.

In other words, the competition om abroad has been largely respon- ble for the unsatisfactory state of e industry as the year ended, de- ite the volume of domestic produc- n.

In November, the American Paper d Pulp Association held a special nference to discuss this situation, d since that time, as a result of the eeting, there has been an especial ort made to stop the abuses of the stoms lays in the importation of per.

As the year advanced, the import- , encouraged by the tendency of the importers to seek new methods of evading the customs requirements, increased the volume of their offerings. And the customs officials, anxious to prevent improper classification of paper, or other improper practices, have been unable to secure specific rulings in favor of the domestic manufacturers, even when the evidence was clear as to the existence of unfair competition.

From a statistical standpoint, the situation is shown by the accompanying figures, indicating the value of the imports and exports for 1922 and 1923.

That much of the difficulty arises from improper practices has long been evident to the industry, and to the government authorities. These practices fall into three groups, undervaluation, improper classification and dumping.

A few instances of the methods used may be mentioned.

Quantities of paper, chiefly wrapping, were offered for entry under a value lower than the true invoice price, thereby lowering the amount of duty charged. Extra duties tentatively assessed totaled about half a million dollars, but nothing was collected, for the importers brought before the customs authorities made the defense that the undervaluation was not intentional fraud, but due to a change of prices in the country of origin between the time of shipment and the date of the invoice.

Improper classification is a widespread evil, and the customs authorities have been diligent in their efforts to check this abuse. Paper of even such grades as low grade bible, printing and wrapping have been offered for entry as standard newsprint, and heavy offerings of hanging paper have been made at prices so low that it seems certain that it has come in without paying duty. Numberless cases of such efforts to bring in paper under a false classification are constantly being referred to the American Paper and Pulp Association.

A noteworthy case is the importation of partially parchmentized paper as wrapping paper, paying a duty of 30 percent, and then its sale to the American trade as parchment, when,

Grade	IMPORTS 1923	IMPORTS 1922	EXPORTS 1923	EXPORTS 1922
Newsprint	$98,021,045	$72,313,567	$1,636,937	$2,337,591
Book Paper	1,140,332	551,947	3,606,783	3,394,337
Paper Board	2,961,618	1,714,766	2,839,356	2,278,306
Wrapping	4,202,594	2,783,766	3,276,445	3,364,162
Fine	650,623	175,980	1,752,217	1,780,219
Tissue	4,127,912	4,233,982	1,791,620	1,672,071
Hanging	558,831	589,013	579,922	407,443
All Other Grades ...	4,474,840	3,491,336	10,194,405	8,904,935
Total	$116,137,795	$85,854,357	$25,677,685	$24,139,064

f properly entered, it would have been ssessed 3 cents per pound and 15 ercent ad valorem.

The violation of the anti-dumping aw has been difficult to prove, chiefly ecause the customs authorities insist on specific proof of injury to paricular paper manufacturers, even when it has been proved by governmental authorities that paper is offered in this country at prices below hose in the country of origin. It hould be understood that to prove lumping, it must not only be shown hat prices of the paper as offered in his country are below the prices in he country of origin, but also that lefinite injury is suffered by the domestic producers by such importaions. Norwegian kraft was proved by governmental investigation to have een sold here for 17 percent under he prices for the same paper in Norway. Canadian kraft has been sold on a basis of 1½ cents a pound less than the price for the same paper in Canada.

The American Paper and Pulp Association, which began its fight against such improper marketing of foreign paper long before the situation became acute, has been continuing its war on dishonest practices, hrough continuous investigations and repeated protests of specific cases to the customs authorities. In a recent letter to members, Dr. Hugh P. Baker, the association's executive, made this statement:

"At Philadelphia it has been found that three invoices were being held by the customs authorities for investigation, and samples of paper were submitted to the association for an opinion as to classification. Two samples, which importers were trying to have admitted as standard newsprint, were found to be printing paper and bible paper, though of low grade. Another sample, which was classified by the importers as wrapping paper, was a sheet nearly as thick as bristol board, with a high machine finish. The paper in fact was such as is used for special art work. The association has recently called the attention of the customs authorities to an offer of hanging paper, delivered in the Middle West at 4 cents. It appears that this paper, to be offered at such a price, must have been classified by the importers, as standard newsprint. The paper industry is being injured every time paper is brought in wrongly classified and undervalued."

This has been followed by explanation of the nature of evidence required by the customs authorities, before they will give a ruling finding dumping:

"To prove dumping it is absolutely necessary to show specific injury to the American manufacturers. It is not sufficient to secure a ruling that this paper is being dumped to show that the prices are below those at which the American mills can manufacture a similar grade of paper. It is necessary to provide the customs authorities with evidence to show that domestic markets have been taken away from the home mills by the importers, and that the domestic mills have thereby suffered definite injury.

"In other words, general injury is not the required evidence, but specific examples of loss of markets or of orders must be provided, with definite statements as to the manner and to what extent such injury exists or may exist.

"Cases now pending seem to be conclusive if such evidence can be provided."

The surprising feature of the association's investigations have been that the governmental authorities refuse to recognize that offerings of even a small quantity of foreign paper at an abnormally low price may entirely upset the domestic market, and work general havoc to the domestic producer, thereby constituting injury to the docestic producer, but that they require a domestic manufacturer to prove specific injury in his own marketing.

This procedure places the burden of proof upon the domestic manufacturers giving the foreigner, instead of the American, the benefit of any doubt that may exist.

Schools Study Papermaking

There is a marked increase this year in the number of calls being received by the American Paper and Pulp Association for assistance to public schools in teaching pupils about paper. The Information Service has distributed considerable literature as aid to teachers and has two sets of stereopticon slides almost constantly on the road from school to school. A Jackson, Mich., school used the slides in a unique way. The descriptive material accompaning the various slides was distributed among the pupils in the fifth grades and instead of being read by the teacher, were recited by the individual pupils as the various pictures were shown.

* * *

Change Personnel

The American Writing Paper Company, Holyoke, Mass., has made several changes in the personnel at their mills. Thomas Duff, superintendent of the Beebe & Holbrook Division has resigned to except a position in Tennessee and William Mathieson has been chosen to succeed him. Mr. Mathieson formerly served in the capacity of superintendent of the Parsons' Division, which position will be filled by George Robinson. Harry Grassett, office manager, will succeed Mr. Robinson at the Riverside No. 1 and 3 Mills.

Paper Exports Exceed 25 Millions

Decrease in Shipments to South America Offset by Gains in Export to Far East and in Book Paper

ACCORDING to the preliminary figures, compiled by the Department of Commerce, exports of paper and paper products from ie United States during 1923 were valued at :5,677,685, or slightly more than one and one-alf million dollars in excess of those for 1922. he difference was due, however, to an increase ı the average price obtained rather than in uantity. Radical changes occurred not only ı the relative importance of foreign markets ut in the comparative demand for the vari-us items. Owing probably to low prices uoted by European competitors, a substantial ecrease is to be noted in exports from the 'nited States to South America, as well as the totals of such classes as newsprint, wrap-ing (other than kraft), paper bags, and the ıeaper grades of writing. These decreases, owever, were more than offset by increased ıipments to the Far East and by gains in ook paper and kraft and such specialties as oxes and cartons, paper and straw board, ease and water proof papers, tissue and crepe apers, hanging paper, carbon paper and wall oard.

Newsprint shipments decrease from 51,528,-18 pounds in 1922 to 32,714,732 pounds in 23, and values from $2,337,591 to $1,636,937 ıt the value of book paper exports increased pproximately $200,000. Cuba was the chief arket with more than seven million pounds, ılued at $752,729, about $175,000 more than . 1922. The total for Mexico, $232,317, rep-sented a loss of more than $10,000, com-ıred with the preceding year. Exports of ook paper to South America also decreased, ıough not to the extent indicated for news-int, total shipments for 1923 being valued at 46,728, or $88,000 less than the value in 22. The Brazilian market accounted for the eater part of this loss, the total value for ıis class declining from $158,000 in 1922 to 2,130 in 1923. A slight increase was re-orted in shipments to Peru which were valued $42,664. In the Far East, which received ook paper to the total value of more than 00,000 gains made in the markets of China ıd British India offset, with a negligible dif-rence, decreases in the Philippines and Japan.

Though sales of wrapping paper (other than aft) in foreign markets decreased nearly 20 r cent in volume, better prices brought the ılue up to substantially the 1922 level. The ıief losses occurred in Latin American mar-ts, particularly in Cuba where the total ılue reached only $321,741, compared with 97,738 in 1922. Exports to England, Canada, ıd Central America, however, increased as ell as those to Japan and the Philippine lands but not sufficiently to offset entirely e decreases in other markets.

Nearly 50 per cent of the paper and straw ard exports, which increased in both quan-y and value during 1923, were shipped to anada. Notwithstanding the fact that this arket received nearly two million pounds less an in the preceding year the total value was creased by more than 100,000. Exports to uba valued at $288,510 during 1923 practi-lly doubled the 1922 total and a moderate lvance is also indicated in the Mexican mar-t. Excepting Columbia, the year 1923 ıowed a decline for this item throughout outh America. Exports to China showed an ıportant increase in qauntity and advanced value to $650,885 a gain of nearly $300,-0 while Japan gained approximately ten ıousand dollars in value. Shipments to Aus-alia and New Zealand decreased both in ıantity and value.

It will be noted that total exports of photographic paper during 1923 very slightly exceeded those for 1922. More important changes occurred in the distribution, however. The value of exports to the most important market, Japan, were $455,922 or over $200,000 dollars less than for the preceding year and shipments to China decreased from $126,530 in 1922 to $35,822 in 1923. Sales to the Philippines improved slightly. South America, the second market in importance with Argentina leading increased from $274,000 in 1922 to $365,485 in 1923 and shipments to Mexico, valued at $135,000, represented a gain of more than $40,000. Improvement is likewise shown in sales to Cuba, England and Sweden.

About 70 per cent of the total exports of boxes and cartons from the United States was absorbed by Canada, which imported 8,790,508 pounds, valued at $778,765 in 1923, an increase of 16 per cent in quantity and 33 per cent in value, compared with the previous year. Following Canada, the next markets of importance were Cuba, Mexico and South America, all of which increased their imports of this product during 1923. Shipments to England decreased slightly in both quantity and value.

The United States nearly doubled its exports of playing cards during the past year both in quantity and value, this item accounting for $1,121,986. Of this more than one half was absorbed by the Far East and sales to England amounted to $121,647. British South Africa ranked third with shipments amounting in value to slightly more than fifty thousand dollars.

A decline of 16 per cent in quantity and 9 per cent in value occurred in exports of writing paper.

Canada's Pulp and Paper Exports in January

THE regular reports of the Canadian Pulp and Paper Association states that exports of pulp and paper in January were valued at $10,900,050. This was a decline of $774,138 from the total for December, but was greater than the total for January 1923 by $601,807.

Details for the various grades of pulp and paper are given below for January 1923 and 1924.

	January 1923		January 1924	
PAPER:	**Cwts.**	**Value**	**Cwts.**	**Value**
Newsprint	1,655,783	$6,134,827	1,874,167	$7,089,061
Book Paper	4,162	26,077	1,986	13,633
Wrapping	18,723	146,762	36,181	266,490
Bond & Writing	739	8,720	1,776	20,377
All Other	——	288,589	——	431,678
		$6,604,975		$7,821,239
PULP:				
Mechanical	597,848	$ 994,917	275,027	$ 500,817
Sulphite Bleached	273,766	1,201,330	233,726	903,410
Sulphite Unbleached	313,847	811,262	386,314	1,026,563
Sulphate	212,031	585,759	218,989	648,021
	1;397,492	$3,693,268	114,056	$3,078,811

The exports of pulpwood in January amounted to 79,405 cords valued at $765,089 compared with 53,416 cords valued at $614,925 exported in December 1923.

Figures for the twelve months ending January 31st, 1924, show a considerable increase in the quantities and value of pulp and paper exports over those for the previous twelve months as will be seen from the following tables:

	12 Months ending January 1923		12 Months ending January 1924	
PAPER:	**Cwts.**	**Value**	**Cwts.**	**Value**
Newsprint	19,492,050	$69,531,292	22,977,629	$86,565,492
Book Paper	35,739	251,003	47,142	353,512
Wrapping	357,148	2,676,966	424,717	3,207,685
Bond & Writing	12,717	138,747	24,259	252,192
All Other	——	3,455,395	——	4,608,340
		$76,053,403		$94,987,221
PULP:				
Mechanical	6,320,879	$ 9,264,929	6,499,319	11,105,223
Sulhpite Bleached	2,958,446	12,122,441	3,157,426	13,276,300
Sulphite Unbleached	4,260,372	10,657,098	4,633,132	12,621,396
Sulphate	2,982,607	9,242,634	2,933,864	9,416,020
	16,522,304	$41,287,102	17,223,741	$46,418,939

The quantity of pulpwood exported in the twelve months ending January, 1924 was 1,330,406 cords valued at $13,094,207 compared with 1,078,566 cords valued at $10,858,705 in the preceding twelve months.

The Riddle of Cellulose

By **THOMAS J. KEENAN**

IN AN ARTICLE published in the preceding issue of PAPER, Prof. Louis E. Wise, of the New York State College of Forestry at Syracuse University, traversed some highly debatable ground in the field of cellulose chemistry.

It has for a long time been accepted by chemists that celluloses of different origin, whether from cotton, wood or straw, are identical in chemical properties. This was the case for many years even before a sufficiently pure cellulose had been obtained to permit of settling on an empirical formula for it. The true constitution of cellulose is yet a debatable point—and the discussion still rages in scientific circles.

The many difficulties encountered in purifying, dissolving and identifying the cellulose molecule are factors which have hindered chemists in reaching a definite conclusion as to its chemical constitution. Cellulose is an inert colloid and does not lend itself to any of the ordinary methods of analysis. It can not be crystallized or melted, and being colloid in character it absorbs and retains a great many foreign substances, which essentially influence its properties. Indifferent or neutral solvents have no action upon it and it dissolves only in acid, alkaline or oxidizing mediums, all of which are prone to change the substance chemically, so that any determinations of molecular weights or purification by such agents are open to the suspicion of causing decomposition of the molecule itself. This suspicion grows to conviction when it is known that under the action of certain chemicals or solvents, cellulose becomes soluble in alkalis or becomes endowed with reducing properties.

The interest which chemistry takes in cellulose is justified by its widespread distribution in nature and by its great technical importance. Nearly all forms of vegetable growth, even seaweeds, can be made to yield cellulose in an organized condition as fibers of definite form. Apart from the use of these fibers in papermaking, the derivatives of cellulose, particularly the esters produced by acetylation or nitration, and the viscose and cuprammonium solution, have become of great importance and industrial value, being extensively employed in the manufacture of photographic films, especially in the motion picture industry, and for the production of artificial silk.

In the endeavor to determine definitely the chemical constitution of cellulose, researches were conducted with the esters referred to, but, as cellulose acetate and cellulose nitrate vary greatly according to their mode of preparation, the results were unsatisfactory. Indeed, chemical pessimists are to be found who aver that the comparatively mild process of acetylation is more than a simple esterification and is one that involves a breaking down and rearrangement of the molecules of the substance which make it impossible to reach a direct conclusion as to the nature of the original cellulose molecule.

For many years chemists of great eminence in their profession have debated before learned societies or have discussed in the more philosophical types of chemical journals—in our own country, as well as in England and Europe—the identity of the cellulose molecule. Out of the welter of debate and argument "about it and about" there have emerged a few facts concerning which a majority of chemists appear to be in agreement. One is that wherever cellulose occurs it is chemically the same, the empirical formula for cellulose from all sources being $C_6H_{10}O_5$. Another is that the molecule of cellulose is very large as indicated by its insolubility, high melting point, colloidal nature, and the molecular weight of colloidal solutions. The third fact which has been determined is one of great importance—namely, that the structure of cellulose consists of glucose molecules, or an isomeric compound of glucose, seeing that cellulose yields with acids 100 percent *d*-glucose.

To penetrate much farther into the fastness of chemical experimentation and speculation might lead the reader astray; it would necessitate an explanation of the constitutional relation between glucose and the cellulose element which would be out of place in a trade journal. However, an outline may be supplied.

It is debatable whether the primary cellulose substance is cellobiose or cellobiose anhydride. The formula of cellobiose is $C_{12}H_{22}O_{11}$, cellobiose anhydride being $C_{12}H_{20}O_{10}$. In the first named two molecules of glucose are combined by the glucoside bond. The aldehyde (acetyl) hydroxyl of one glucose molecule splits off water with the fifth carbon atom of the second glucose molecule. In the case of cellobiose anhydride one molecule of water is eliminated between the aldehyde hydroxyl of the second glucose molecule with the fine-hydroxyl of the first glucose molecule.

An important recent contribution to this much discussed question is to be found in one of the most responsible of the German chemical journals, *Justus Liebigs Annalen der Chemie* (Band 435, Heft 1 u. 2). I am indebted for a summary of this article to Dr. Mary Jacobson, the scholarly librarian of the Lehn & Fink Laboratories, Bloomfield, N. J. The authors, Hess, Messmer and Weltzien favor the glucose anhydride formula as the result of an investigation of the behavior of cellulose and its derivatives in cuprammonium solution. On dissolving cellulose in Schweitzer's reagent, wihch is a solution of copper hydroxide in ammonia water, they found that a copper cellulose compound of high rotary power was formed to which they gave the formula $CuC_6H_{10}O_5$, having proved it to be an individual compound and not a mixture of various compounds.

A radiograph of the cellulose precipitated from its cuprammonium solution showed it to be very similar to a radiograph of fiber cellulose. The fact that cellulose is not hydrolyzed when dissolved in Schweitzer's reagent is deemed proof sufficient that both kinds of cellulose are identical and that $C_6H_{10}O_5$ is the original cellulose molecule.

Cellobiose, which is regarded by other investigators as the basic substance of cellulose does not

Electrical Supercalender Drive

Description of the System of Dual Frequency Apparatus

By O. C. CORDES

Paper Mill Section, General Engineering Department,
Westinghouse Electric & Manufacturing Company

THE supercalendering of paper is one of the important operations in the finishing of many kinds of paper. This operation is an art rather than a science and much depends upon the calender operator to produce the particular finish required. According to the kind of calender rolls and the weight applied, the required finish is given to the surface of the paper. The operator of the calender is entirely responsible for the finish. The amount of weighting and the speed of calendering is all determined by rule of thumb and experience.

There are usually but two speeds required in connection with the calendering of paper, these are known as "Threading-in" and "Running." However, at times it is quite desirable to have intermediate speeds so that the calender can be slowed down for bad or weak spots in the sheet. The "Threading-in" speed is normally about one-tenth the full running speed. The method of supercalender motor drive most prevalent at the present time, and up to the time of the conception of the Westinghouse Dual Frequency Drive involves either a single or two-motor equipment.

The single motor drive obtains its "Threading-in" and "Running" speeds by means of suitable gear reductions and clutches. The two-motor drive utilizes two motors, the larger of which drives the calender at "Running" speeds through a spur gear reduction. The small motor drives the calender at "Threading-in" speeds, through the larger motor by means of an additional gear reduction and an over running clutch.

The Westinghouse Dual Frequency Drive was designed primarily to eliminate the necessity of a larger reduction, or a separate motor with its gear reduction and over running clutch for obtaining the "Threading-in" speed. For this drive both the "Threading-in" and "Running" speeds are obtained from one motor through a single gear or chain reduction to the lower calender roll. It is self-evident that from a mechanical standpoint this is a less complicated drive and requires less space than either of the other two principal systems of drive.

The Westinghouse Dual Frequency Drive consists of a single motor which drives the lower calender roll through one chain or gear reduction, a control panel, a controller, stop push button stations, necessary safety switches and a frequency changer set together with the required transformers. The frequency changer set reduces the primary voltage and frequency to approximately 10% of its normal value. This reduced frequency and voltage when impressed upon the motor causes it to rotate at approximately 10% normal speed, which in turn produces the desired "Threading-in" speed on the calender. From the standpoint of first cost, a type of drive such as this, is of course, most economical where two or more calenders are installed.

The motor is of the wound rotor type and is designed to have a high starting torque at the low frequency, so that it will be able to start the supercalender stack under the most extreme load conditions. The controller operates in conjunction with the control panel as follows.

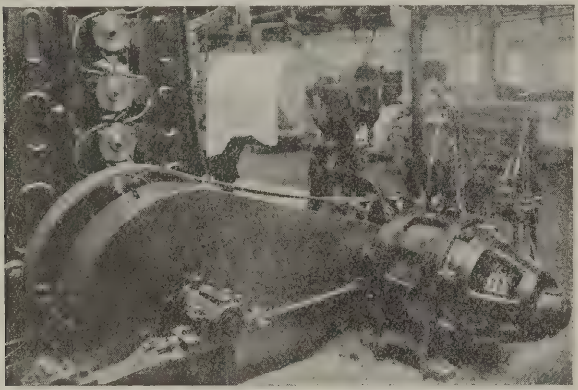
May be Mounted in Basement or near ceiling or in any other Place where they will be out of the way.

Schematic Diagram

The first step of the controller connects the motor to the low frequency source with all secondary resistance cut out. The second step disconnects the motor from the low frequency source and connects it to the high frequency source, and inserts resistance into the rotor circuit. The subsequent steps serve to cut out the secondary resistance in the rotor circuit until full speed on the motor has been obtained. The secondary resistance is so designed and adjusted as to give smooth acceleration from "Threading-in" to production speeds, thus avoiding paper breakage. "Stop" push buttons are provided for mounting in desirable places, so that the calender can be stopped without having to touch the controller. However, in order to again start it is necessary to return the controller handle to the "Off" position and come up through the low frequency point to the running speed.

The frequency changer is of the commutator type and is a specially designed machine for frequency conversion. The armature of this machine is similar to that used in rotary converters. The commutator brush gear however, is arranged for three phase current, and requires three equally spaced brush arms per pair of poles. The stationary part consists of a laminated core built up in a cast iron frame similar to that of an induction motor. Excellent commutating conditions are obtained over its entire load range due to its rotary converter action and special design features.



Typical view of motor and enclosed chain drive to calender stack, also showing rear of control panel. The small space requirements are evident.

The action of the machine in changing the frequency is somewhat similar to a rotary converter, but instead of operating at synchronous speed and producing direct current, it is operated at a speed a few per cent below or above synchronous speed and therefore delivers a current having a frequency proportional to the percentage which the armature speed is above or below synchronous speed. The machine is usually designed to operate at such a percentage below synchronous speed as to give the desired "Threading-in" speed on the calenders.

Frequency changer set, of sufficient capacity for 9 calender stacks, together with its transformers; also drum controller with contactor panel for one calender. 6 cycle and 60 cycle cables are shown back of frequency changer

The frequency changer itself may be driven by a small direct current motor of sufficient size to overcome the mechanical friction of the set or by an induction motor of similar size and suitable speed characteristics, and in some cases may be designed to operate at the required s without the use of a driving motor at all. The loa the small driving motor is not affected by the load or frequency changer.

The commutator type of frequency changer is muc be preferred to the induction type for obtaining a frequency as it is a much smaller machine and has r higher efficiency and better voltage regulation. An ir tion type frequency changer would be about 20 time large as the commutator type and would have losses five or ten times greater.

The schematic wiring diagram and layout shows a cal installation of the Westinghouse Dual Frequency percalender drive, together with the wiring arrange between the frequency changer, the motors and the cor It will be noted that the control and wiring is extre simple and that each supercalender operates entirely i pendent of the other. The capacity of the freqency cha is such that all of the supercalenders can operate a "Threading-in" speed at the same time. It will be r from this diagram that a small motor generator set of than 10 KW capacity is shown supplying direct cu to the motor driving the frequency changer. In a having direct current available this set is not require would it be in cases where an A. C. driving motor is

View in calender room showing seven or nine calender stacks together with motor and chain drives. Observe small amount of space taken by the driving equipment. The leather link belt which drives the calender reel is also shown

Side view of calender stack showing motor, chain drive, control panel and type "S" controller

The first of these installations was recently made i plant of the Kalamazoo Paper Company, at Kalam Mich., where there are now nine supercalenders oper with this system, totally enclosed chain drives being for speed reduction between motor and calender. T calenders were originally steam engine driven from a line shaft to which they were belted.

Some of the advantages derived from this system of drive are:

- (a) Greatly increased production and flexibility.
- (b) Elimination of noise.
- (c) Decreased lighting cost.
- (d) Reduced physical exertion on operators.
- (e) Increased cleanliness.
- (f) Saving in oil and floor space.
- (g) Reduced personal hazzard and fire risk.

The satisfactory performance and marked economies in the operation of this installation is gratifying and much appreciated by the management.

The increase in production was effected by three major means *i.e*: N

- (a) Increased speed of calenders.
- (b) Greater flexibility of operation.
- (c) Reduced physical wear and tear on the operator.

The old belt drive together with the gearing and clutch mechanism on the calenders was exceedingly noisy, very dirty, greasy, and a pronounced fire hazard. Furthermore the numerous belts required, cut off a considerable portion of daylight from the room and made it necessary to resort to artificial illumination. The continual shifting of clutches required by the old method of drive tired the operators physically, so that during the latter part of the day production fell down very materially. This condition was noted particularly in the specific case where two light weight men were operating a calender stack. There the production was increased some 20 per cent due entirely to the more flexible and easy operation of the dual frequency system of drive.

According to figures obtained from the management of the Kalamazoo Paper Company, the production has been increased 25 per cent by the installation of this new type of supercalender drive.

The space requirement for this type of drive is very much less than that required by the old method, and besides it has the further advantage in that the control can be located where it is deemed most convenient for operation. Therefore, the only piece of apparatus which is truly fixed is the motor and the drive. In the old type of drive all parts are fixed permanently so that they cannot be shifted to suit the space into which they are to fit.

Through the able handling of the installation work by W. H. Scott, chief engineer for the Kalamazoo Paper Company, and his assistant, the change over work from the old belt drive to the new Westinghouse Dual Frequency drive was effected without loss in production.

Waste in Pulp and Paper Industry

WHY?

By **B. T. McBAIN**

Director of Mfg., Nekoosa-Edwards Paper Co.

Why is it the Laws are such that a man growing peaches or prunes may join an association of like growers and pool his crop to the best advantage as to sale, while a man growing spruce trees cannot do likewise?

Why is it that a man producing apples may combine to secure a living price for his product but the man producing bricks cannot do so? Yhy is it that one American citizen producing what each and every other American citizen needs for food can under the law produce an article in combination with other like producers and charge the whole consuming public a price that will allow of a living wage to be paid his employees and have a decent return on his investment, while people in other lines of endeavor dealing with only a few, comparatively speaking, must submit to ruinous competition and be forced to shut down his plant to the end that he cannot pay his employees a living wage and cannot have a decent return on his investment.

Why? Politics, is the answer in my opinion.

I believe it is right that the food producer should be protected and should be allowed to co-operate with his competitors. I believe further that all other legitimate producers should be protected and should be allowed under proper supervision to cooperate with his competitors in exactly the same way.

Our American constitution guarantees equal rights to our citizens, but in this particular case our laws are not allowing equal rights.

I cannot see why, when cut-throat competition is on, one of the producers cannot be allowed to go to all the others and say "Gentlemen, we cannot live under this kind of competition. We should agree not to cut prices further and get this market back onto its feet, to encourage the buyers and get them to have confidence to the end that we can all of us, at least, live." Then say further that we should each one send to our customers a letter that we will not cut prices further for the next quarter.

But as the law now stands we are not allowed to do this. We are not allowed to talk prices or to combine in restraint of trade; while an agreement of this kind, while the market is all upset, would not be in restraint of trade, but a help, a life belt when things are sinking and some are about to drown in the sea of cut-throat competition, that is not and cannot ever be considered legitimate.

Why not put up our case in the strongest possible way and apply to the powers that be, for a hearing to the end that we may all live?

As it is, when unfair competition comes, who gains? No one. Who loses? Everyone, but particularly that important part of our citizenship the so called common people, the workingman.

A shut down, though he may be paid a living wage when working, soon brings the wolf to the door of many homes. Ruinous competition brings nothing short of shut down and loss.

Why? Politics and WASTE.

Offer Bonds to Public

The Parker-Young Company has offered $2,500,000 first mortgage, 6½ sinking fund gold bonds to the public. They are dated January 1, 1924 and are due February 1, 1944.

The Parker-Young Company, incorporated in 1917 under the laws of Maine, is the successor of Parker-Young Company, the business of which was founded in 1843. In 1917 the Company acquired the business and assets of the Henry Paper Company at Lincoln, New Hampshire, and also owns all or nearly all of the capital stocks of a number of subsidiaries.

The properties of the Company include a pulp and paper mill at Lincoln, New Hampshire, with a capacity of 25,000 tons of paper per year; a ground wood mill at Livermore Falls, New Hampshire, operated in connection with the Lincoln mill; approximately 70,000 acres of timber land in the Pemigiwassett Valley, about twenty miles of logging railroad connecting the greater part of this timber area directly with the Lincoln mill; developed water powers at Lincoln and Livermore Falls; practically the entire village of Lincoln, and other incidental properties, constituting all the elements of a complete manufacturing enterprise. Other properties of the Company and its subsidiaries include further extensive areas of timber lands in New Hampshire, Vermont and Florida; two modern and efficient saw mills, and three mills manufacturing piano sounding boards, one or more of which also produce boxes, shooks, tables, piano backs and other parts, interior finish and veneer. The diversity of these products enables the Company to use its timber resources to the best advantage.

The Editorial Page

The Story of the Year

A DOLEFUL tale is told in the figures just made public by the American Paper and Pulp Association regarding paper imports and exports for the year 1923. It is, indeed, a sad story, mates.

Combined in those columns of figures is the tale of a tragedy, the tragedy of a government that is not watching out for the interests of an important industry. It is poignant, aching tragedy when almost a hundred million dollars worth of newsprint paper is imported into this country and only a million and a half exported. It is sheer tragedy when the value of imports on all kinds of papers increases approximately one quarter from 1922 to 1923, while exports scarcely maintain the same level in 1923 that they had in 1922.

The single glow of brightness in those figures is the fact that domestic consumption is splendid. There was a total production of paper in this country of 7,200,000 tons during the year 1923. This is some 200,000 tons over that of 1922 and slightly less than the production in 1920, the extraordinary boom year.

But unless the tariff schedules are changed so that they are favorable instead of adverse to the American paper industry, there can only be a passing, sporadic prosperity in the mills of this country. Increased efficiency in production helps, the more modern machinery of America helps, the better calibre of men in America helps, better merchandising systems help, but as long as the government of the United States permits most countries on the face of the globe to send paper here at ridiculous tariff rates, it is impossible to forecast a permanent, sound prosperity for the industry.

It is, of course, the old, hoary story of the standard of living and rate of pay. It seems to have been dinned in the ears of Congress fairly successfully by other industries, that the American rate of wages is far, far above the rates in other lands. But the American paper industry has been grotesquely remiss in this. No speed, or skill, or machinery, or systems will make it possible for workmen getting almost as many dollars as foreign workmen get pennies to produce paper as cheaply as the latter.

It can't be done in the steel industry. It can't be done in the textile industry. It can't be done in the paper industry or any other industry. And yet the government must think that the paper industry is superhuman and can do the impossible.

While, of course, newsprint has by far the largest ratio of difference, in some degrees the same situation occurs in all branches of the industry. It is particularly noticeable in the paper board, wrapping paper and tissue paper branches. A total of $4,127,912 worth of tissue paper was imported in 1923, while only $1,791,620 in tissue was exported. Just about twice as much, in value, of wrapping paper was imported as was exported, without burdening you with figures. The difference is not so great in paper board.

The statistics bring down on paper what is, of course, generally known throughout the industry. It is in truth, thrusting in the knife just a little deeper. It makes the injury hurt more.

Despite the fact that it has now been a long standing ill, it doesn't seem reasonable to suppose that the paper industry of the nation is going to sit down, hope for the best and twiddle its thumbs. The tariff situation is wound about with miles and miles of cloying, entangling, tripping red tape, it is burdened with precedents, and the commission clogged with more cases than the leaves of the forest in June, but nevertheless, a fighting, fact-showing campaign eternally sustained is bound to bring results. Certainly nothing is gained by supine submission to the will of present law. Surely, it is discrimination against the paper industry to protect other industries far better than this one. Surely, the representatives of other industries are not better diplomats than those in the paper industry. Then, the battle should be renewed.

For in the newsboy's parlance, "Taint right."

The Future of the Paper Industry

Editor Paper:

The contribution by Norman W. Wilson to the above important subject is admirable and illuminating, and causes thought and investigation.

Since the paper industry is one of the sixth largest in the U. S. A. as he informs us in the *Paper Mills & Wood Pulp News*, published February 16th, it is certainly one that affects our entire population from the cradle to the grave. It is one of prime importance to all and of greatest service to all and should interest us all to facilitate, economize and propagate for its paramount importance all over that of other industries. Most of us, however, can but plead greatest ignorance to its essential necessities, and how we can best meet foreign competition and husband the industry at home.

But it seems to me, that the actions of those engaged in the industry, should make some of the greatest reforms for their own profit and to economize the cost of paper products to consumers, which is to facilitate the sales of such products and effectually meet the worlds' competition. The errors I see manufacturers making is their clustering together until the habit has become extreme, illogical and suicidal. To explain what I mean, I will relate, that I have read in the organs of the industry that 81% of all the papermaking plants in New York state, all of the New England states and all of the Lake states are entirely dependent on purchase of pulpwood to employ their plants, which means to incur long expensive freight hauls, and which at least partially explains why we are importing 40% or more, of the pulp wood made into paper in the United States. Billions of cords of such wood are going to decay following saw mill operations or being consumed by fires to the destruction of a promising young growth over most of the Southern states.

I have also observed from the same source of information, that the four states of North and South Carolina, Georgia and Tennessee, in their entire aggregate of manufactured paper in different years have run far below one per cent of the paper manufactured the same year in New York State alone. While the four Southern states just named are large consumers of paper, like other states surrounding same which are also large consumers of paper, are making very little. According to the public press, North Carolina alone has 22,000,000 acres of wooded lands, and the South is full of decaying wood following saw milling operations with a fairly good per cent of virgin timber remaining untouched. I have read from time to time in the organs of the pulp and paper industry, that the delivered price of pulpwood at the plants was close around $23.75 per cord. We will most gladly contract the price of anywhere from one million to two million cords of pulpwood standing, so as for the delivered cost to not exceed $3.75 per cord, saving mill men $20 per cord on our pulpwood or a saving of $40,000,000, if they should want two million cords. We have an undeveloped water power in practical distance, and we will grant the free use of same. Not only for the development of the one million or two million cords, but will grant the continuous use of the power, free of any cost except its development by parties who buy our wood.' We will also give the free use of lasting streams of clear fresh water for washing pulp and free factory sites on deep water fronts. Where the paper products can be loaded onto largest ocean ships at the plant. Which plant location is below the confluence of several navigable rivers and many floating tributaries, all heavily wooded throughout their length to perpetuate the pulpwood supply indefinitely. Handled by navigable water to this good old port city this challenges comparison for economy of cost, where climatic conditions, cheap living and many other favorable conditions which lead to larger profits and lower prices for the products than any known in the dozen or more Northern states, where 81% of their plants are purchasing wood at high prices and paying long expensive freight hauls.

As the above pulpwood referred to is removed, we will perpetuate the supply by the growth of mulberry trees. The rapidity of which growth is so remarkable that a good crop can be harvested every ten years. In the meantime there is a good annual income from the fruit of the red and black mulberry for raising pigs and poultry and for edible and canning uses, besides an annual crop of silk from the leaves of the white mulberry free of any cost by the use of cocoons.

We have read that the mulberry makes a fine strong and tough paper, while ten varieties rank among the most rapid growth known. The same like the cotton plant is peculiar to the South, and will not grow as far north as New York State.

The one hundred and four cotton textile mills located in Gaston County, N. C., we understand have sufficiently demonstrated that the cotton textile can be more economically manufactured locally than the same textile cost to manufacture north. Hence paper can be manufactured south much cheaper than north since 90% of all the paper made in the United States is now being made from wood.

The merits of paper made from mulberry points the future source of our paper supply. Its matchless rapidity of growth, its luxury and money merit meaning such an annual income must make it an argument settler which when studied and understood sufficiently will not require a prophet to tell us the future of the pulp and paper supply.

W. Crawford Smith.

Box 1128, Wilmington, S. C.

Forestry Briefs

The Japanese Financial Commission in the United States has announced that the budget for restoration purposes following the earthquake includes $295,000,000 for reforestation. This is to be met by loan flotations from 1924 to 1928, much of which will be raised in Japan.

Capt. Harry Quigly, prominent in Quebec aerial fire prevention, has gone to England to buy some new planes, with equipment particularly suitable for fire prevention work. The aeroplane today is not only used in Quebec for spotting the fires, but also to rush teams of men to the field for the actual fighting of the flames.

The importance of forestry to solve the fuel and moisture problems of the farmer, as well as for the production of a timber crop is being emphasized to Canadian farmers, and a speaker before the Dominion Grange advised his hearers to pay more attention to the effectiveness of the forest in preventing the too rapid dissipation of moisture collected in the fall and winter months.

Spruce to socks is the latest campaign involving forestry to be discussed by Canada. In Mr. Fieldings budget speech he proposes a heavy duty on artificial silk yarns and fabrics, to aid in the development of this type of forest products. The United States produces nine million pounds a year of the world's product of forty-four million pounds. It is pointed out in Canada that the success of the artificial silk industry is largely dependent on the production of a high grade pure white sulphite pulp.

Also for Girls Only

If there happens to be any of you who have been going with the same "steady" ever since the last leap year and the young man is still backward, kindly advise us and maybe we can dope up some sort of a formula to use on him directly after January 1st.

LIFE OF ACTIVITY ENDS FOR D. G. GARABRANT

Paper Manufacturer of Prominence Dies at Bloomfield Home

DAVID G. GARABRANT, paper manufacturer, banker, college executive, nationally known Baptist layman and one of the oldest and most prominent residents of Bloomfield died Monday evening, February 18, at his home, 76 Williamson Avenue, that town.

He was born in New York City seventy-seven years and went to Bloomfield when he was four years old. He had lived there ever since.

Mr. Garabrant was senior partner of the firm of Bulkley, Dunton & Co., of New York, paper manufacturers, and was active in the affairs of the company until he was taken ill a week ago. He was also president of the Union Paper Mill of Middlefield, Mass.; a director of the Ryegate Paper Company of Ryegate, Vt.; a member of the board of directors of the New York Manufacturers' Real Estate Company and Wednesday night was elected president of the Bloomfield Savings Bank, of which he had been vice president and manager for three years. He succeeded in the presidency of the institution the late Theodore H. Ward. He was also a director in the Bloomfield National Bank.

In addition to having served on numerous boards controlling policies of the Baptist Church in this country, Mr. Garabrant was, at the time of his death, chairman of the executive committee, National Baptist Memorial Church, Washington; chairman of the board of directors of the American Baptist Home Mission Society and a member of the finance committee of the society; a member of the board of directors of the New Jersey Baptist Convention, a member of the advisory board of the Baptist Home for the Aged and a member of the board of directors of the missionary co-operation committee of the New Jersey convention.

Activity in Colleges

He had served for several years as president of the board of directors of Peddie Institute, Hightstown; Virginia Union University, Spellman Seminary, Atlanta, Ga. endowed and named for Mrs. John D. Rockefeller, and Leland College, Baker, La., and was a trustee of Shaw University, Raleigh, N. C.; Benedict College, Columbia, S. C., and Morehouse College, Atlanta, Ga. He was a member of the New Jersey State Committee of the Y .M. C. A. and president of the Latin-American Improvement Association.

During the war he was a member of the executive committees of the Liberty Loan, Y. M. C. A. and Red Cross drives and recently was a member of the executive committee of the building fund drive of the Mountainside Hospital.

Mr. Garabrant's wife, who was Miss Annie Fairbanks, died twenty-three years ago.

He leaves a son, Joseph E. Garabrant, and two daughters, Mrs. F. A. Stone and Mrs. J. L. Burdett, all of Bloomfield. Funeral services were conducted Thursday afternoon at 3:15 o'clock in the First Baptist Church of Bloomfield by Rev. James A. Monk, pastor. Burial was in Bloomfield Cemetery.

Fear Spruce Bud Worm

Timberland owners in Washington County, Maine, are much concerned at the spread of the ravages of the spruce bud worm and it is reported that vast areas of timber in that section are rapidly reaching a point at which they will not be worth salvaging. In order that the owners may know how soon they must cut in these areas in order to save the spruce James A. Beal, assistant forest entomologist, is making a survey in Washington County to ascertain the rate of speed of the spruce bud worm increase and also the rate at which the killed timber deteriorates.

CONSTRUCTION NEWS

A Summary of Vital Facts Regarding Construction, Finances and Operation of Paper Mills

Chattanooga, Tenn.—The Tennessee Paper Mills, Inc., has plans under way for enlargements in its plant and will provide facilities for an increase from 50 to 60 tons of paper box stock per day. Work is now in progress on the installation of a steam-operated power plant at the mill, estimated to cost approximately $80,000. It is expected to have the unit ready for service at an early date.

Corning, N. Y.—The Corning Wood Fibre Products Co., affiliated with the Corning Glass Works, Walnut Street, has preliminary plans under way for the construction of a new local plant, to be one-story, brick and reinforced concrete, 100x300 ft., estimated to cost about $55-000, including equipment. A. M. Tietzel is company engineer.

New York, N. Y.—Morris Katzenbogen, 176 Wooster Street, manufacturer of paper boxes, has leased a floor in the building at 142-44 Greene Street, and will use it for expansion. It is understood that the present works will be removed to this location.

Marion, Ind.—The Elam Paper Co., has abandoned plans for the removal of its plant to Dayton, Ohio, recently announced, due, it is stated, to the fact that citizens of the last noted community have failed to subscribe in necessary measure for the erection of the proposed new mill. The company will remove its present works at Third and Nebraska Streets to the building at Second and Nebraska Streets, Marion, where increased facilities will be available. It is proposed to develop a larger output in the near future. S. L. Elam is president and general manager; J. H. Schaumleffel, vice-president; and W. H. Willy, secretary.

Lebanon, Pa.—The Lebanon Paper Box Co., is perfecting plans for the construction of a brick and steel addition to its plant for considerable increase in capacity, with reported cost in excess of $65,-000, including equipment.

Holyoke, Mass.—The American Tissue Mills, Inc., has work well under way on a new power plant at its works, and plans to have the structure ready for service at an early date. It is estimated to cost close to $37,000. The Casper Ranger Construction Co., Holyoke, has the general contract for the structure. McClintock & Craig, 33 Lyman Street, Springfield, Mass., are engineers.

Newark, N. J.—The Newark Box Board Co., Blanchard Street, has tentative plans under advisement for the rebuilding of the portion of its plant, destroyed by fire, Feb. 14, with loss unestimated. The fire was confined, for the most part, to a one-story structure, 50x100 ft.

Dallas, Tex.—The Crown Paper Box & Label Co., recently organized, will operate a local plant for the manufacture of a line of paper products, including cardboard boxes, etc. Leo Singer is president.

A LAUGH A WEEK

A Good Joke On a Paper Trade Man

$5.00 for Each One Used

THIS WEEK'S WINNER

MISS MYRIE H. CONNET
Lebanon, Oregon

Possibly a Joke

A reader of PAPER magazine after perusing the short article which said that the German marks were being purchased by foreign paper manufacturers and used in the manufacture of various kinds of paper called up by telephone, H. A. Swafford, mill manager of the Crown-Willamette Paper Company's plant at Lebanon, Ore., and inquired if his mill was buying German marks.

"No," Mr. Swafford shouted over the telephone, "we are not buying them or any other waste paper for use in our mill. We use nothing but white fir to make paper."

Rumford, Me.—The Continental Paper & Bag Mills Corporation, recently formed under Delaware laws, has taken over the local mills of the company of the same name, and plans for extensive operations, developing full capacity. It is said that the Rumford plant of the International Paper Co., with which the new organization is affiliated, will also be taken over at an early date.

New York, N. Y.—The General Paper Novelties Co., 43 Mercer Street, has leased a floor in the building at 457-61 West Broadway, for enlarged space for increased capacity.

Watertown, Wis.—The Rock River Paper Co., care of William C. Stone, Bank of Watertown Building, has acquired a local site for a new mill and plans to commence construction in the spring. It is said that an engineer will soon be selected to prepare plans. The estimated cost has not been announced.

Richmond, Va.—A new local plant will be operated for the manufacture of paper raincoats, located in the East End section of the city. The company is known as the Emergency Raincoat Corporation and is operating in a smaller mill, with capacity of about 500 coats per day. It is purposed to develop a production of close to 5,000 paper raincoats daily in the new works. W. C. Carpenter heads the organization.

West Hopkinton, N. H.—The Davis Pa
Co., has tentative plans under advi
ment for the rebuilding of the port
of its local plant, destroyed by fire, F
12, with loss estimated at $11,000, c
fined, for the most part to the sto
house division.

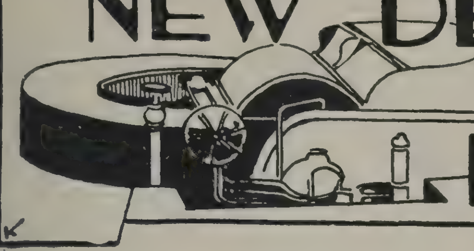
for the production of paper bags, for p
posed equipment installation in a lo
plant.

NEW DEVELOPMENTS IN PAPERMAKING



Beating Paper Pulp

German Patent No. 381,632, which is assigned to Plauson's Forschungs institute G.m.b.H., is concerned with a process of beating, sizing, coloring and filling paper pulp and other fibrous materials. The paper pulp is mixed with the requisite materials, and beating, sizing, coloring and loading are effected in a single operation in a colloid mill. Only small quantities of alkali and the usual flocculating materials such as aluminum sulphate need be added. As a result a variety of dyestuffs which could not be employed in the presence of large quantities of these reagents can be utilized. If, desired, the bleaching of the product can also be carried out in the mill. These favorable results can also be applied to the production of pasteboard and the like from substances such as finely divided straw, peat, heather and other fibrous materials.

* * *

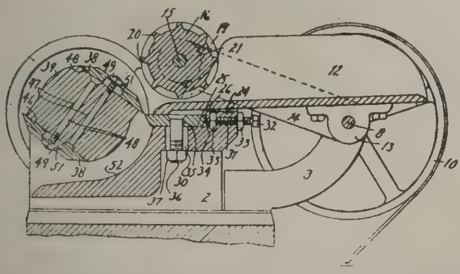
Removing Ink from Paper

Ink and other stains on paper are removed by treating the same with an addition compound of a hydrosulphite and an aldehyde, or a mixture containing such a compound, moistening with an equeous solution of acetic acid or derivatives of acetic acid or its homologues, and then rubbing and heating. The process is patented in German Patent No. 380,316.

* * *

Waste Paper Shredder

The figure shows a shredding machine which contains a revoluble knife-head, a bed-knife, a bed-knife support having an open-top and an open-end integral trough with its bottom underneath the head. A part of the trough is approximately concentric with the head and a part is straight and unbroken and has a downward pitch. For further details see United States Patent No. 1,481,058.



* * *

Dense, Strong Paper

In the process of manufacturing dense, strong papers which is patented in German Patent No. 379,996, assigned to Dr. C. G. Schwalbe, the treatment of the material with acids, acid salts, or substances which yield acids, is continued only to such an extent that there is a maximum swelling but no decomposition of the fibrous material, and during or after the treatment the material is worked up mechanically. Organic acids, such as, formic acid, acetic acid, oxalic acid, lactic acid and tartaric acid are preferred as swelling agents.

* * *

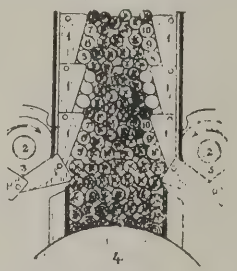
Waterproofing Paper

An apparatus is described in British Patent No. 184,462, for waterproofing and hardening cellulosic materials, particularly paper. In this process gaseous thionyl chloride or sulphur chloride is used as the waterproofing agent A gaseous medium like air is charged with the finely divided reagent by means of an atomizer in a closed chamber and is then displaced into a second chamber through which the material is to be treated, for example the web of paper, is drawn. The rate of travel of the paper web through this chamber is such that the duration of the treatment is from one to ten seconds. The air subsequently returns to the charging chamber through successively a drying apparatus, an apparatus for removing hydrochloric acid, and sulphur dioxide, and a blower.

* * *

Feeding Device for Wood Grinders

German Patent No. 386,501 is concerned with a feeding device on mechanical pulpwood grinders as is seen in the accompanying illustration. The feeding device consists of a chain which is provided with cone shaped parts. These press up against the column of wood and slowly move it against the stones. The coneshaped parts are seen at 1 in the figure. The geared wheels which cause the chain device to move are shown at 2. The grinding stone is seen at 4. It is clear that the pressure of the cone shaped parts against the logs of wood increases as the logs near the stone.



* * *

Cooling and Absorbing System for Sulphur Dioxide

The Brown Company has secured a patent on a system of cooling and absorbing towers for sulphur dioxide. (See United States Patent No. 1,469,959.)

The gases from a sulphur burner are led through a combustion chamber into a cooling tower which is packed with inert material, down which cooling water flows. The cooled and washed gases are then treated with cold water on the counter-current principle in two absorption towers that are packed with limestone, dolomite and the like, so that a solution of calcium bisulphite suitable for the manufacture of sulphite cellulose is obtained. The weak acid liquor from the second absorption tower is pumped to the top of the first to wash the strongest gas, and the liquor flowing from the first tower is delivered to a storage tank.

The hot water which flows from the cooling tower contains some sulphur dioxide. This is recovered by passing the liquid down a tower which is packed with inert material. Up this tower a portion of the washed gas from the second absorption tower is passed. This removes all the sulphur dioxide in the liquor, and is mixed with the gases passing into the second absorption tower to be rewashed. In this way nearly complete recovery of the sulphur dioxide is obtained and the preliminary cooling and washing simplifies the operation considerably.

* * *

Variegated Colored Paper

German Patent No. 387,181 is concerned with a process of manufacturing a colored paper with designs. Any sort of paper is glued to the edges of a sheet of ordinary newsprint and then itself covered with an adhesive. Then the sheet is placed on a thin felt and worked with blunt wooden tools, or implements made of thick cardboard until the desired design is reproduced on the paper. After drying the high spots in the paper may be colored or treated in various other ways.

Paper Recovery System

An ingenious system of removing ink from paper and recovering the fibers to make pulp fit for conversion into new paper, is provided by certain improvements to apparatus for which John Stevens, 3d, has been granted a patent (U. S. Patent 1,482,825, February 5, 1924). The patent which has been assigned to Arthur D. Little, Inc., provides a new apparatus quite different in construction from prior inventions of its kind.

It is customary in recovering waste paper to first produce a pulp of the desired consistency and thereafter treat the pulp with a suitable form of detergent to loosen the ink and other foreign matter which it is desired to remove, thereafter the detergent together with the loosened ink being washed out to thoroughly cleanse the fibers and convert the pulp into a condition suitable for further use. The several operations incident to this conversion of the waste print paper have been heretofore carried on separately and intermittently, the process as a whole consuming considerable time and involving substantial labor costs in addition to the space occupied by the necessary machines and storage chests for the pulp.

It is the object of the present invention to provide a new process and accompanying apparatus which overcomes the foregoing disadvantages incident to prior methods of deinking waste paper.

Accordingly one feature of the present invention contemplates a continuous advancing movement of a pulpy mass of waste paper between the pulping and washing points while subjecting the pulp to the several operations essential to the complete removal of the ink and other foreign material therefrom.

Still further features of the invention will be apparent to those skilled in the art from the following complete description of the process and apparatus for practicing it.

The accompanying drawing illustrates diagrammatically an apparatus embodying the novel features of the invention.

According to the present invention the waste print paper is first beaten or otherwise formed into a pulpy mass in the presence of hot water which may range in temperature from 140° to 180° F. depending upon the character of the waste paper under treatment, this operation being designed to produce a substantially continuous flow of paper pulp.

After suitably regulating the consistency of the pulp it is mixed with a detergent such as soda ash solution and maintained in contact with the detergent for a sufficient period of time to effectually free the fiber from the ink sizing and other foreign materials. This treatment with the detergent takes place during a continuous advancing movement of the pulp toward the washing point at which all of the foreign matter including the detergent is completely separated and removed from the fiber.

In the illustrated embodiment of the invention the pulp, after impregnation with the soda ash solution, advances along a series of troughs or rifflers which are so designed that the movement of the pulp thereover occupies a sufficient period of time to permit the desired action of the detergent in emulsifying or otherwise effecting the separation of the ink, sizing, etc., from the waste paper. It is preferred to arrange the surface of the troughs over which the pulp flows at a slight inclination to cause the movement of the pulp thereover to be produced by gravity although this may also be accomplished through the provision of a riffler provided with a series of transverse partitions of diminishing height over which the pulp successively passes.

The washing machine in which the pulp is freed from the ink provides for a continuous movement of the pulp therethrough until discharged into suitable storage chests. According to this process it will be observed that the movement of the pulp from the point of its formation to the final washing point is
tinuous, the several intermediate operat
taking place during this movement.

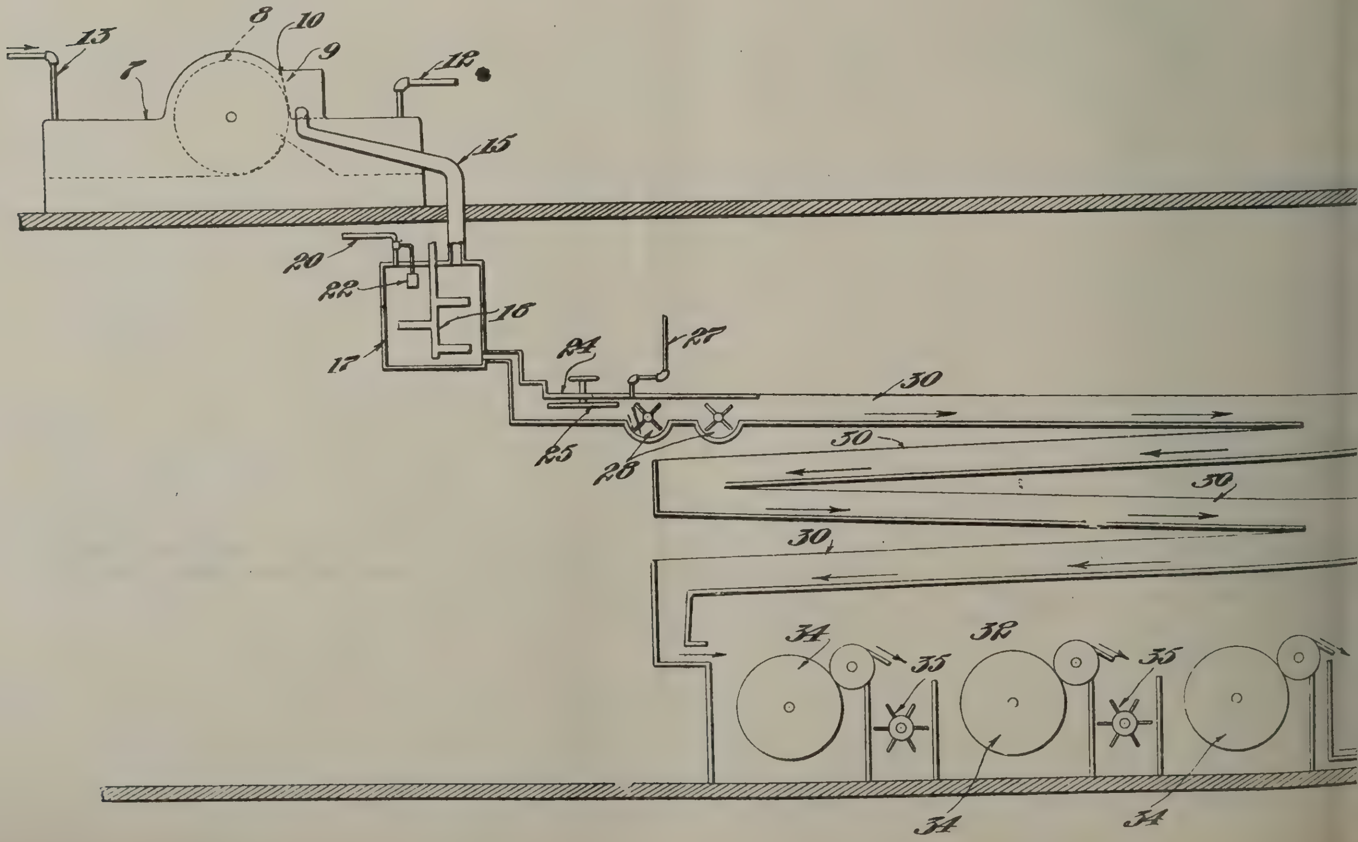
Upon referring to the drawing it wil
observed that the waste paper first pa
through a beater of the usual form indic
at 7 and comprising a beating cylinder 8
signed to discharge the pulp through a s
of holes or perforations 9 formed in a p
tion 10. From this point the pulp flow
gravity into a conveyer pipe 15 communica
with a mixing vat or tank 17. The beat
is provided with intake pipes 12 and 13
hot water and steam respectively and du
the beating operation the pulpy mass is he
to a temperature ranging from 120° to
F. depending upon the character of the w
print paper. The mixing vat is provided
an agitator indicated at 16 and serves to a
matically regulate the temperature of the
For this purpose the vat may be provided
a steam line indicated at 20, which is
trolled by a suitable form of thermostat a

From the mixing vat the hot pulp flow
gravity to a consistency regulator indicat
24 which may be of the usual form consi
of a channel having an adjustable gat
therein to regulate the cross section of
discharge passage.

The pulp thus regulated as to temper
and consistency is next mixed with soda
solution entering through a pipe 27 and
oughly mixed with the pulp by suitable a
tors 28.

After being thus impregnated with the
line detergent the hot pulp is discharged
one or more inclined troughs 30 along
it flows by gravity to be finally disch
into a cylinder washing achine, indicat
32, the washing machine as is usual in
class of apparatus comprising cylinders 3
agitator beaters 35 arranged alternately.

As will be observed from the drawin



nclined trough along which the pulp flows to convey it to the washing mechanism is preferably made in a zigzag form to cause the pulp to traverse back and forth while constantly descending. With this arrangement the mechanism for initially forming the pulp may be located upon an upper floor and the washing mechanism upon a lower floor, the ntermediate operations taking place during the movement by gravity of the pulp from the beating mechanism to the washing mechanisms. Furthermore owing to the configuration of the troughs in the form of a zigzag these may be supported adjacent the wall of the building in such a manner as to occupy a relatively small space.

The detailed claims of the inventor follow:

1. An apparatus for the treatment of waste printed paper comprising means for forming a hot pulp solution, means for thereafter mixing the solution with an alkaline detergent, a trough to remove ink and dirt therefrom. treatment with the detergent and of sufficient length to cause the detergent to remain in contact with the pulp during a substantial period of time, and means for receiving and washing the pulp after its discharge from the trough to remove ink and dirt therefrom.

2. An apparatus for the treatment of waste paper which comprises mechanism for beating the paper to form a pulp, means for heating the pulp thus formed, means for regulating the consistency of the pulp, means for mixing a detergent with the pulp, a series of connected troughs into which the pulp discharges after treatment with the detergent, and washing mechanism to receive the pulp discharged from the troughs and remove the ink and dirt with which the pulp is impregnated.

3. An apparatus for the treatment of waste printed paper comprising pulping mechanism, means for impregnating the pulp thus formed with an alkaline detergent, washing mechanism for removing the detergent and ink from the pulp, and connections between the mixing and washing mechanisms for causing a continuous and relatively slow movement of the pulp therebetween.

4. An apparatus for the treatment of waste printed paper comprising means for forming a pulp and mixing the pulp thus formed with an alkaline detergent, washing mechanism to free the pulp from the ink and other foreign matter located below the pulping mechanism, and a zigzag trough connecting the pulping and mixing mechanism with the washing mechanism and adapted to cause a continuous movement of the pulp therebetween.

January Newsprint Statistics

The 45 United States companies reporting produced 128,772 tons and shipped 123,253 tons, the 20 Canadian companies produced 109,875 tons and shipped 107,966 tons, making a total production of 238,647 tons and shipments of 231,219 tons in both countries. These companies also produced 1,750 tons of hanging, of which 532 tons, were made in Canada. Production exceeded shipments in United States by 5,519 tons and in Canada by 1,909 tons. Stocks at the end of January totaled 28,417 tons in the United States and 16,493 tons in Canada, a combined total of 44,910 tons which is equivalent to 4.5 days' average production, says the News Print Service Bureau Monthly Bulletin.

Comparing production of 55 identical companies during January 1924 with that of January 1923 the United States companies show an increase of 2,324 tons or 2 per cent., the Canadian companies an increase of 10,538 tons or 11 per cent, and the total of all these companies shows an increase of 12,862 tons or 6 per cent.

The average daily production of news print paper by these 55 companies reporting for January amounted to 91.9 per cent of the average daily output during the three months of greatest production in 1923, with allowances for changes in machines.

SALESMEN SEE FUTURE WITH CONFIDENCE

Success of Mid-Winter Conference Causes Other Meetings In Country

THE enthusiasm for the Salesmen's Association of the Paper Industry developed at the New York Mid-Winter conference of the Association with the executives will result in similar meetings being held in three other sections of the country before the annual convention in April.

John E. A. Hussey of Boston at once planned for a get-together at Boston within a a week. W. E. Perry, vice-president for the New England district announced plans for a meeting in the Springfield district, while Robert T. Houk, Jr., vice-president for the Miami Valley began plans for a general conference in the Ohio region.

Over sixty salesmen and executives attended the New York conference at the Yale Club, Wednesday, February 20, and an executive committee meeting of the Association held following the luncheon took up plans for general advancement of the Salesmen's Association for the entire country. Those in attendance were: G. G. Abernethy, International Paper Co.; Bertram Blake, Marquardt, Blake & Decher, Inc.; Martin Cantine, Martin Cantine Co.; Howard A. Casey, Chemical Paper Mfg. Co.; Edwin C. Chadwick, L. L. Brown Paper Co.; J. D. Coffin, Tidewater Paper Mills; F. N. Countiss, Martin Cantine Co.; Allan Curtis, International Paper Co.; L. M. Davis, International Paper Co.; Philip T. Dodge, president, International Paper Co.; Fred Enders, Bulkley-Dunton & Co.; R. D. W. Ewing, American Writing Paper Co.; J. L. Fearing, president, Salesmen's Association, International Paper Co.; Charles F. Gordon, Oxford Paper Co.; Harold Hopkins, Bulkley-Dunton & Co.; Nathan R. Hopkins, Bulkley-Dunton & Co.; Robert T. Houk, Jr., G. H. Mead Co.; J. H. Howe, general manager, Arrowhead Mills, Inc.; G. A. Keeney, Jr., Arrowhead Mills, Inc.; Edward G. Lloyd, Bulkley-Dunton & Co.; A. George Lutz, Invincible Pulp & Paper Corporation; J. V. McNamara, International Paper Co.; O. F. Marquardt, Marquardt, Blake & Decher, Inc.; H. W. Mason, Marquardt, Blake & Decher, Inc.; C. W. Nickenig, Canadian Export Paper Co., Ltd.; H. J. Northcott, Pejebscot Paper Co.; Edwin D. Peck, Reading Paper Mills: Walter E. Perry, Chemical Paper Mfg. Co.: J. W. Quimby, Allied Paper Mills; Ira S. Reynolds, Mead, Patton & Co.: Chester M. Robbins, St. Regis Paper Co.; D. W. Sherman, Canadian Export Paper Co., Ltd.; F. B. Smidt, International Paper Co.; Henry W. Stokes, Fork Haven Paper Co.; Roger Brooks Taft, Hammermill Paper Co.; R. C. Tilden, International Paper Co.: D. Page Wheelwright, G. W. Wheelwright Paper Co.; G. M. Wetmore, Groveton Paper Co., Inc.; Dr. Hugh P. Baker, Ex-Officio.

A feature of the New York conference was the round table discussion of business conditions by representatives of the various grades, showing that there has been a gratifying resumption of business since the holidays. H. V. Kaltenborn of the Brooklyn Eagle discussed current events, and was followed by Henry W. Stokes, President of the American Paper & Pulp Association. Mr. Stokes devoted his talk to the discussion of the work of the American Paper and Pulp Association and its accomplishments in behalf of the entire paper industry of the United States. Philip T. Dodge, president of the International Paper Company was the next speaker with a strong statement of his belief in the work of the Association.

"The world has been rapidly learning of the value of co-operation," said Mr. Dodge, "and today's meeting is a fine evidence of the possibilities of this Association along co-operative lines. Great progress has been made of late by the paper industry in standardization, as well as in simplification of paper sizes, and the standardization of sales methods by co-operative study of sales science by the Salesmen's Association is just such a forward step. The interests of a whole industry are greater than the individual problems, and by co-operation the salesmen can help each other solve their mutual problems."

* * *

NEW KRAFT MILL TO BE STARTED

Two Machine Mill to Be Erected at Old Hickory, Tenn.

PLANS have been perfected for the building of a two machine Kraft paper mill at Old Hickory, Tennessee. The pulp mill is already completed and has a capacity of 150 tons per day. The paper mill will be equipped with two large, high speed 184" Beloit Fourdrinier machines each capable of producing 75 tons of Kraft paper per day.

The pulp mill was built by the old Nashville Pulp and Paper Company which has been reorganized and refinanced and provided with adequate capital. The new company will be known as Old Hickory Paper Company, Old Hickory, Tenn. John I. Beggs of Milwaukee, President and R. J. Cullen, Vice-president and Manager. Mr. Beggs is prominently identified with large banking institutions and also with large public utility interests, while Mr. Cullen is well known throughout the trade as a very capable and successful paper mill executive, having many years' experience in building and operating Kraft paper mills. One of his most recent achievements being the construction and starting up of the now famous Bastrop, Louisiana mill of the Bastrop Pulp and Paper Company.

Contracts have already been awarded to the Beloit Iron Works for these large, high speed, paper making machines, embodying all the latest improvements, such as the Beloit Removable Fourdrinier, the Beloit Rope Drive and many other important features. Orders have also been placed for beaters, Jordons and power equipment. Contract has been awarded for the steel for the paper mill building, a construction force has already been organized and started work clearing off the site and preparing for the rapid construction of the new paper mill. The first unit is expected to be ready for production in the fall of 1924.

It is understood that this new mill will be ideally located with respect to the Kraft markets and will enjoy an abundant supply of suitable pulp wood and good water.

The officers of this new mill have determined to make this the finest Kraft mill in the South and it will be equipped with all the latest labor saving devices which will contribute to a low cost of paper. The building will be of re-enforced concrete and brick and nothing will be spared to produce a thoroughly high class modern Kraft paper mill.

* * *

H. T. Maynard Dies

Henry T. Maynard, South Sudbury, Mass., organizer of the Converters' Paper Company and a prominent figure in the paper trade, died at his home February 16 following an illness of two days. Mr. Maynard was 51 years of age and is survived by his widow, a daughter and a son.

FORESTRY in the PAPER INDUSTRY

Conducted by J. R. Simmons, Secretary Forester, the New York State Forestry Association

NATIONAL FORESTRY POLICY NEAR IS THE OPINION EXPRESSED

National Forestry Program Committee Brings History of Movement Up-to-Date

TO the end that there might be available a complete but concise record of the progress of the forestry movement in the United States, PAPER submitted in last week's issue a resume by R. S. Kellogg, President of the News Print Service Bureau, covering the progress made up to the present year. There has appeared within the week a statement by the secretary of the National Forestry Program Committee, W. B. Bullock, giving the detail of the work accomplished, particularly by the pulp and paper industry, during the years 1919 to 1923. In presenting a review of Mr. Bullock's statement we are moved to suggest that there are grounds for satisfaction on the part of all who have taken an active part in the solution of one of the Nation's outstanding problems. While the statement is doubtless true that the rapid spread of the forestry movement dates from a conference held in the State of New York on the first anniversary of Armistice Day, November 11, 1920, it must be kept in mind that Col. Graves, at that time national forester, had just come into the East after conferring with Western lumbermen and pulp men, and that adequate preparation for the big forward movement was quite as important in its way as the series of advances that is now bringing victory to all crusaders in forestry. Once again it is team work all along the line that has won the day.

Approaching the Definition of Federal Policy

The nation today is nearer to the definition of a federal forest policy than ever before in its history, and there is legislation in sight now formulating a reasonable policy which would ensure the continuous production of the timber needed by the nation's industries.

In November, 1919, the problem of a national forestry policy was definitely broached, as a national issue that must be met, at a conference of the New York State Forestry Association, New York Section of the Society of American Foresters and other New York state organizations in a Forest Policy Conference at Syracuse, at which Col. H. S. Graves appeared after a series of regional conferences with lumbermen in the West. From that time on the movement spread rapidly. Some of the high spots were as follows:

Paper Industry Leads Campaign

Winter of 1919-20—American Paper and Pulp Association named a Forestry Committee to begin study of possibilities of a national forestry policy.

Spring of 1920—Definite campaign for such a policy sponsored at annual meeting of the American Paper and Pulp Association, which further indicated its sincere approval of this movement by securing Dr. Hugh P. Baker, a forester then in educational work, as its executive secretary. Specific recommendations for national and state forest policies made by Forestry Committee of this Association.

December, 1920—National Forestry Program Committee formed, with representatives of the publishers, forestry, lumber and paper associations prominent in the personnel of the committee.

December 22, 1920—Snell forestry bill, sponsored by National Forestry Program Committee, introduced in House of Representatives, followed by the introduction of the McCormick bill, in essence the Snell bill, and the Capper bill in the Senate.

Spring, 1921—Extensive hearings before House Committee on Agriculture.

National Chamber Interested

Spring, 1921—Forestry Comittee named by United States Chamber of Commerce, which traveled 10,000 miles that summer, studying local conditions in the various forest regions. This committee after long discussion finally filed its report in 1922. The paper industry was represented on this committee by Dr. Hugh P. Baker, who served as its vice-chairman.

Feb. 7, 1923—Clarke forestry bill introduced in House of Representatives to secure early action on immediate questions needing settlement.

March 7, 1923—Select Senate Committee on Reforestation named, and 9,000 miles traveled on investigation of conditions during the Summer and Fall.

Nov. 17, 1923—Referendum on forestry report of the National Chamber of Commerce Committee resulted in a ballot overwhelmingly in favor of all but one proposition, and a majority vote recorded for that one provision. This empowers the National Chamber to work for the enactment into law of the proposition given a two-thirds vote. This referendum brought a larger popular vote from Chamber members than any referendum in the previous four years.

Dec. 15, 1923—Senate Committee reported a bill embodying the result of the special committee's survey.

Jan. 7, 1924—Companion to the so-called McNary bill introduced in the House of Representatives by John D. Clarke.

Present Status—Senate bill is in the hands of the Senate Committee on Agriculture, and the Clarke bill is before the similar committee of the House of Representatives.

Movement Is Nearing Success

The American Paper and Pulp Association can well be proud of the leadership it took from the start in the efforts to secure legislation formulating a national forestry policy. Its forestry committee included R. S. Kellogg as a member, and he was, as the representative of the paper industry, made chairman of the National Forestry Committee which from that time forward assumed with other wood using industries and forestry associations, leadership in the demand for federal legislation.

Antagonism on the part of some extremists both among the technical foresters, and the industries to any legislation which did not meet their particular views has no doubt prevented definite action before this, but the McNary bill now seems to be so fair a solution of the problem as to be accepted by the extremists among the private rights industrialists, and to be sufficiently a step forward to be accepted in general by the professional foresters as a step in the right direction.

1924 PULPWOOD SUPPLY

Stocks Relatively Low and This Will Cause Increase in Price

CONTRACT prices for pulpwood in 1924 are generally higher than the prices in 1923, according to the December pulpwood report of the Woodlands Section of the American Paper and Pulp Association, while stocks are relatively low in most of the regions reporting. The figures given are more representative than in any previous compilation, a larger number of companies reporting from nearly every region than in most of the preceding quarters.

Ninety-two companies, with an annual consumption of 3,388,860 cords, have contracted for 1,950,757 cords for 1924, but the relationship of contracts to annual consumption varies widely by districts. New York state mills have contracted for only 37 per cent of the annual consumption, while New England has contracted for 86 per cent of the total needs. The lake states contracts are 68 per cent of the annual needs, and in the middle Atlantic states, 44 per cent, while the percentage in the South is 45 per cent.

The range of prices is widely different in the various regions. Some examples, however, are as follows: New England rough wood contracts for 1924 are reported as averaging $14.86, and $17.08 for peeled wood, as against December 1 prices at $13.75 and $16.96, respectively. New York peeled wood for 1924 is on a $20.77 basis, as against $19.33 as of December 1, but the Lake States show a slight increase only. It is to be noted that the higher prices in New England are for a large proportion of the year's requirements, and the mills will not be in the market for any large quantity of wood from now on for 1924.

An interesting feature of the detailed report is the amount of jack pine under contract in the lake states. With a consumption of 143,750 cords annually, jack pine has passed balsam in quantity consumed, and ranks next to spruce, hemlock leading the list in those states with 452,800 cords out of a total of 1,123,860 cords.

* * *

Spruce Reproduction

In connection with studies of growth and yield of red spruce in the Northeast the Forest Service, United States Department of Agriculture, notes that the severe cutting to which the stands of spruce and fir have been subjected in this region, where these species are in constant demand for pulpwood, is tending to change the composition of these stands radically.

Recent examination of such areas by the Northeastern Forest Experiment Station shows that although reproduction is generally abundant over the cut-over tracts little or no spruce or fir has come in since cutting. This is mainly because of the fact that in cutting very few trees over five inches have been left, and, consequently, no seed of these species is available. The one, two, and three-year-old seedlings are mainly white pine, of which some seed-bearing trees have been left, and hardwoods, which are not now being utilized but are producing immense quantities of seed, and are therefore tending to dominate the stands.

Out of 10,180 seedlings counted on an average acre, 58 per cent were conifers of which few had come in since cutting, and 42 per cent were hardwoods, nearly all of which had come in in the last three years.

VAST QUANTITIES OF PULPWOOD CUT

Nashwaak Pulp and Paper Company Breaking Record This Year

MORE pulpwood is being cut by the Nashwaak Pulp and Paper Company on the lands owned by the company in central New Brunswick, than for any previous winter season. This concern owns vast tracts of pulpwood lands along the Nashwaak River. It was on this cite that the company was contemplating the erection of a pulp mill and a paper mill, some time ago. This project has not been abandoned, being merely the subject of deferred consideration. On the Nashwaak River, the company maintains booms, besides logging operations. Woods crews are continually at work in this territory for the Nashwaak Pulp and Paper Company. On the river, the company also operates rafting and driving crews in the spring and summer. The operations last summer were somewhat handicapped by a strike of employes for more wages.

The Nashwaak Pulp and Paper Company is adding to the lands owned by the company, and practically all of the pulpwood areas in control of this concern are located along the Nashwaak and Miramichi Rivers. The Nashwaak Pulp and Paper Company is controlled by the Oxford Paper Company of New York City, which operates paper mills in Maine. The Oxford Paper Company shares the control of the Nashwaak Pulp and Paper Company, with the Standard Paper Company of Kalamazoo, Mich. The pulp mill of the Nashwaak Pulp and Paper Company in St. John, N. B., is one of the largest in eastern Canada, the capacity having been increased one-third recently.

The Fraser Companies, operating pulp mills in Edmundston and Chatham, are cutting pulpwood very heavily this winter. The Fraser interests own pulpwood lands in New Brunswick and Quebec. Their holdings in both provinces are immense, and they are adding to these holdings. Although, this combination of companies was caught in the post-war slump, indications are that the losses encountered in the past few years will be replaced by profits.

Donald Fraser, son of Donald Fraser, Sr., the founder of the Fraser interests was recently re-elected president of the New Brunswick Temperance Alliance, a prohibitionist organization of long standing, and in which he has maintained a lifelong interest. Mr. Fraser is vice president of Fraser Companies, his brother, Archibald Fraser, being president.

Gave Valentine Dance

The Beloit Iron Works club, composed of employes in the plant making paper mill machinery gave a valentine dinner dance at Messer Hall, Saturday night. There were more than 100 present. An orchestra furnished music during the four course dinner. Valentine decorations were carried out on the tables and in the hall. Charles Anderson was social chairman. Employes of the Beloit Iron Works also have a bowling league consisting of four teams, the Dryers, Collenders, Winders and Reels.

Assets Are Sold

The assets of the Clarke Brothers, Limited, of Bear River, Nova Scotia, were sold recently through a court order to New York and Chicago interests, the purchase price being $200,000 in cash and securities of the new company, having a total par value of $1,300,000. The new manager will be C. W. Rancoul of New York. This plant has been idle for some time; it is one of the most complete of its kind in Nova Scotia.

SAYS EMBARGO WOULD WORK HARDSHIPS

Paper Manufacturers of Maine Hold an Informal Meeting

AT an informal gathering of pulp and paper manufacturers of Maine at Portland last week, the Canadian embargo was discussed. The embargo is now under consideration by a royal commission in Montreal.

George F. Teed, pulpwood dealer of Montreal, said that the supposed unlimited supply of pulpwood in Canada was a myth and that there is only a strip about three hundred miles wide, running from coast to coast, which is suitable for pulp. Further north, he said, is only a scrub growth. He estimated that within a period of twenty years the supply of pulpwood in Canada would be exhausted.

Mr. Teed said that at present there is overproduction and wood can be purchased cheaply. He said that while Canadian mills were paying but $17 for pulpwood, mills in the United States were paying $21 and the freight was but about 70 cents. The largest part of the export wood goes to New York and Pennsylvania. If, however, mills in the United States have to pay much more, they will get their supply from Europe.

E. Martineau, another Montreal dealer, said that while an embargo would have been a good thing years ago, today it would work great hardship and heavy losses, both financially and in population because many farmers now selling wood in the winter season, would be obliged to go elsewhere.

* * *

Forced To Curtail

Paper mills along the Wisconsin River have been obliged to curtail operations because of low water. The river is at low ebb due to a long period of drought. The temperature has continued low throughout the winter and as a result the usual melting of snow has not occurred to increase the flow of water.

Manufacture of paper stopped at the Wisconsin Rapids and Biron plants of the Consolidated Water Power and Paper Company this week and officials say that for the next thirty days it probably will be necessary to shut down the machines for a day or two each week.

Only one of the three Wisconsin River paper mills at Stevens Point has been affected, as the others do not grind their own pulp, a process which consumes much of the water pulp generated. There were no heavy autumnal rains this year and there has been little precipitation since September. The river basin was soon drained of surface water and with the coming of cold weather smaller tributary streams froze, shutting off the only remaining source of additional water for power.

* * *

To Have New Company

Connecticut is to have a new paper manufacturing industry. The Pequonocke Paper Company has been incorporated and will locate at Windsor, Conn. The new company is capitalized at $300,000 and expects to commence operations early in April. William S. Kenyon of Hartford is one of the incorporators and head of the new company.

* * *

File a Petition

Trustees of the Cushnoc Paper Company of Maple street, Augusta, Me., which is now operating under a receivership, have filed a petition with the courts asking permission to issue trustees certificates to the amount of $150,000 for the purchase of pulpwood, the same to constitute a first lien on all pulpwood now or hereafter acquired by the company.

New Kenwood Guard Board

Close study of jacket and couch roll conditions in many mills has enabled the F. C. Huyck Co., felt and jacket manufacturers of Albany, N. Y., to devise a guard board for jackets that is based on sound and logical principles. This guard board has been tried in a number of mills and has proved satisfactory.

The guard board on a jacket is there for the purpose of squeezing as much as possible out of the jacket before it comes in contact with the formed but still very moist sheet of paper. The sheet passes through a press whose top roll is covered by the jacket. The amount of pressure that it is possible to give the sheet in passing through this press must be finely regulated by adjustments, and if the jacket carries only a trifle of additional moisture it will displace the fibers in the formed sheet and make a fault in the paper which spoils it. So the guard board that takes this moisture out of the jacket is a most important part of the machine.

The pressure of the guard board on the jacket has always, up to now, been regulated by several screws at uniform distances apart across the jacket. While it was desirable that the pressure across the entire width be uniform, this adjustment was at best a matter of guess. The manufacturers claim that the Kenwood board insures that the pressure of the guard board on the jackets will be uniform throughout by eliminating the adjustment by guess. It is believed by the designers of this new device that many jacket troubles were caused by the irregular pressure on the jacket by the old guard board, and that the jackets will now go to the end of their usefulness without the need of local adjustments in the width of the board.

Prices Advance

The Mathieson Alkali Works, Inc., announces a further advance in its prices for Liquid Chlorine and Bleaching Powder, effective February 14th, 1924, to apply on all business for future delivery taken after that date, as follows:

Bleaching Powder for spot sales and contracts for future delivery in carloads.

$1.75 per 100 lbs. in standard (700 lb.) drums f.o.b. Niagara Falls

$2.00 per 100 lbs. in small (300 & 400 lb.) drums f.o.b. Niagara Falls

"Shipments in less-than-carloads, spot or contract, fifteen cents (15c) per 100 pounds above these prices."

Liquid Chlorine for spot sales and contracts for future delivery in tank car lots and in cylinders.

$4.00 per 100 lbs. (Single Units or Multi Units) f.o.b Niagara Falls

$5.00 per 100 lbs. in cylinders, in carload lots, f. o. b. Niagara Falls

$5.50 per 100 lbs. in cylinders, for sales of more than one ton, f.o.b. Niagara Falls

$6.50 per 100 lbs. in cylinders, for sales of one ton and less, f.o.b. Niagara Falls

Elam Drops Plans

Plans of the Elam Paper Company, of Marion, Ind., to enter into competition with the several score paper mills in the Miami Valley by moving its plant to Dayton, have been dropped, it is learned here on good authority.

The Elam Company will remain in its present location for an indefinite period, thus passing up the opportunity for cutting in on the Miami Valley water supply, which has drawn paper mills of all kinds to this city, Middletown and Franklin.

Removal of the Elam plant was to have been effected through sale of an additional issue of capital stock. Arrangements had been made with a Dayton brokerage firm to put this stock before the public and a promotion scheme was launched.

An option had been taken on a Dayton plant. This was surrendered.

FINANCIAL PAGE

International Paper Gets New Start

Company Again Showing Good Margin of Earnings for Stock—Sound Financial Position

HARD HIT from three quarters at the same time, in 1921, the recovery of the International Paper Company from depression has been slower than that of most companies. Added to the difficulties of the company in 1921 as a result of sharp drops in prices of wood, of which International Paper had a large supply, and in the selling price for the finished material, together with a slump in the demand, was a long drawn out and costly strike. The strike finally was settled in a manner satisfactory to the company by the abolition of unionism, but earnings were adversely affected. Las year, however, the company again hit its stride, and when the final accounts are made up it is believed that a net income of approximately $4,000,000 will be shown. This makes a striking contrast with a deficit last year of $6,216,000 after deducting dividends of $1,500,000, but before inventory adjustment.

Leading Paper Producer

International Paper Company is by far the leading paper producer in the world, with an average annual output of around half a million tons, says Carlton A. Shively in the New York *Evening Post.* The bulk of production has been and still is, though to a less extent, newsprint, of which International manufactures more than three times as much as its nearest competitor. The company's twenty-five paper and pulp mills have a productive capacity of approximately 2100 tons of paper and well over 2000 tons of wood, sulphite and kraft pulp a day. These plants, together with numerous sawmills, are located in Maine, Massachusetts, New Hampshire, Vermont, New York and the Canadian provinces.

In addition to these properties International Paper owns and operates water power plants and owns and leases a large number of valuable water power sites. Woodlands owned in fee or through subsidiaries consist of more than 1,314,000 acres in this country. In Canada the company owns and holds under license from the Government some 2,870,000 additional acres and in addition has 324,300 acres of fee lands.

An Old Concern

International Paper was incorporated in 1898 as a merger of nineteen concerns, many of which had long been in the paper business. Growth since then has been considerable, and subsidiaries of whose capital stock International owns all or a controlling interest number twenty-four. Of these the largest are the Continental Paper and Bag Mills and the Canadian International Paper Company. The latter was organized with a capital stock of $20,000,000 to build and operate a paper mill at Three Rivers, Quebec.

Prior to 1915 International Paper's average yearly surplus was far from impressive for a company of its magnitude. With the advent of the present management, however, and aided by inflated prices and demand during the war, profits increased by leaps and bounds. In the four-year period 1916-1919 earnings on the common stock averaged close to 22 per cent annually. But this was only a starter for the banner year 1920, when net income applicable to the common stock mounted up to over 52 per cent. In that year the price of newsprint on contract had climbed from $75 a ton to $130 a ton.

Does Well Despite Handicap

This sharp price in newsprint followed the end of Government price control in 1919. Just as the upward swing was carried far, so was the reaction violent. Newsprint fell in 1921 to as low as $70 a ton, and the price of wood took perhaps an even greater proportionate drop. International, unfortunately, had large quantities of high-priced wood and woodpulp. Moreover, attempts of the company to hold down wages somewhere in line with commodity prices resulted in a severe strike, which reduced output about 65 per cent and prevented the working up into paper of much of this high-priced wood. Deflation, the strike, and high operating costs combined brought the company an aggregate loss, including inventory write-offs, of $14,650,000 in 1921 and 1922.

Its pulpwood now in stock in the United States exceeds a million cords and is of a value equal to the face value of the outstanding bonds.

Still, even allowing for these severe losses, the company has during the past decade earned an annual average of between 8 and 9 per cent for its common stock, and in the previous ten years earnings was fairly large. Under these circumstances the question naturally has arisen as to why the company has failed to pay dividends on its common shares for over twenty years. The answer is not difficult to find, and the solution of this problem gives a hint as to the solution of the future common dividend problem.

Where the Money Goes

Roughly speaking, the company has had a net operating surplus of twenty millions in the ten years ended with 1922. Increase in plants, in inventories, and greater needs for property extensions, improvements and working capital, meanwhile, have acquired sums in excess of this amount. It is easy to see, therefore, why it was not deemed advisable to distribute dividends to common-stock holders.

And need for a good deal of cash is going to continue for a few years, at least until the company has completely adjusted itself to changing conditions in the industry. Rapidly growing foreign competition, particularly Canadian, the refusal of Congress to put a tariff on newsprint while protecting other grades, increasing costs, and steady exhaustion of supplies of wood in this country are materially altering the aspect of the situation.

Foreign competition has become a real problem for International Paper. The bulk of the newsprint imported into the United States comes from Canada, which is supplying a larger and larger proportion of our consumption each year. Canada is gaining a never increasing advantage, owing to vanishing timber lands in this country. How imports of newsprint have increased in quantity and value is shown in the following table:

Year	Value	Pounds
1923	$98,021,045	2,617,685,620
1922	72,354,266	2,058,535,612
1921	79,123,368	1,584,962,674
1920	68,600,950	1,459,737,288
1919	43,674,094	1,255,468,758
1918	35,023,161	1,192,540,059
1917	30,929,628	1,118,225,912
1916	18,527,748	936,460,899
1915	14,138,651	736,817,721
1914	12,189,792	630,590,295
1913	8,920,390	446,445,685

Consumption of newsprint in this country amounts to about 3,000,000 tons a year. In 1913 domestic output totalled 1,305,000 tons, while that of Canada amounted to only 350,000 tons. In 1920, owing to the high prices, domestic production reached the record total of 1,512,000, but last year it was 1,485,000 tons, which is an increase of only 13.7 per cent over 1913. Canadian output, meanwhile, has steadily expanded, reaching 1,263,000 tons last year, whereas in 1913 Canada produced only slightly more than 20 per cent of the total of the two countries; ten years later her output was 46 per cent of the total.

Facing the Situation

Newsprint manufacture in Canada also is stimulated by an embargo on export of pulpwood from Dominion crown lands, leased to United States manufacturers, and a movement is on foot now to extend the embargo to include wood cut on fee lands. In any event, it would appear to be only a comparatively short time until Canada becomes the principal newsprint manufacturing country in this hemisphere.

International Paper is meeting the situation in four ways: (1) By extending mill operations into Canada; (2) by diverting production from newsprint to fine grades of paper; (3) by converting mills into hydro-electric power plants; (4) by reducing costs.

Forseeing the time when wood would have to be obtained largely in Canada, the International Paper Company secured lumbering permits for large areas from the Canadian Government. Plans went awry, however, when the Provincial Government of Quebec, ignoring existing leases, forbade the exportation of pulpwood cut on crown lands. To overcome this obstacle International Paper constructed at Three Rivers, Quebec, one of the finest paper mills in the world. Capacity, which is now between 300 and 320 tons of newsprint a day, can be increased with a small outlay to 500 tons daily. Unlimited electrical power is at hand and some 3000 square miles of timber lands owned or controlled by the company lie behind the mill, the wood from which can be floated down without difficulty. For mechanical equipment, quality of output, economy, and limitation of labor the plant is said to be unequalled.

Turning to High-Grade Paper

At present about 88 per cent of the company's producing capacity is in the United States, while about 70 per cent of its timber lands are in Canada. Presumably the wood supply in this country will last but a few years. The company can bring in pulpwood from some of its Canadian holdings, but this is rather expensive and, as mentioned above, may yet be stopped by Government action. At any rate, if the company is to maintain its position it will have to add to its Canadian mill facilities, and this is understood to be the policy of the present management.

As a further measure to keep profits up in the face of newsprint competition and other handicaps, the company has been going more and more into production of the better grades of paper. In 1913 newsprint comprised about four-fifth's of the company's total output, whereas in 1922 newsprint output was only about twice that of other grades. The production for 1923, notwithstanding a period of abnormally low water at several of its mills, was 537,927 tons, of which 352,518 tons were newsprint paper.

Water Power Development

A third step taken by the company in readjusting its position is the development of its extensive water powers. At a cost of several million dollars it has erected at Sherman Island on the Hudson River a vast hydro-electric plant from which about 20,000 k. w. of electricity are being sold daily. It has also completed within a few months a large hydro-electric plant on the Saranac River. It has also well advanced two other hydro-electric plants in the State of New York. Plans are also under way for the transformation of six of the company's seventeen mills into hydro-electric plants.

Finally, International Paper is doing much toward reducing expenses by installing better machinery and increasing the efficiency of labor. Its employee housing plan is a model of corporate foresight and should go far toward improving the relations between employer and employee.

Strong Financial Position

In 1917 it was decided to pay up preferred dividend arrears and consoliate funded debt. As the first step a new issue of first and refunding sinking fund 5 per cent bonds were authorized in the amount of 20 millions. This included $7,500,000 of series A. convertible into 6 per cent preferred stock. Of the total over $8,000,000 was set aside for plant extensions and improvements.

To carry out this plan the authorized preferred stock was increased from $25,000,000 to $32,500,000, solely against the convertible feature of the new bonds. Finally, it was voted to pay the 33½ per cent accumulated preferred dividends with 7½ per cent in cash, 14 per cent in 6 per cent cumulative preferred stock, and 12 per cent in common stock. All but a comparatively small proportion of the preferred stockholders accepted these payments, but a small amount is still due on the remainder.

In spite of good earnings and conservative dividend policy the company was compelled to lean rather heavily on the banks, loans at the end of 1921 amounting to $15,000,000. To improve the working capital position and provide funds for plants, as previously mentioned. $12,500,000 of the series B bonds were issued in 1922 bringing the total funded debt slightly above $19,000,000. Ample security lies back of these bonds, and interest charges apparently were covered five times over last year. The working capital position meanwhile has improved, though it is necessray for the company to have around $8,000,000 tied up in raw materials. However, the value of the wood pulp and pulpwood on hand is greatly in excess of present bank loans.

Plant readjustment, of course, takes money, and until it is completed it may be that common shareholders will have to wait for a distribution of profits. One thing is certain, and that is that when the common is placed on a dividend basis the company will be in a position to maintain the payments. Last year the preferred dividend was earned more than twice over, and the balance applicable to the common amounted to approximately $12 a share.

So far as can be judged at this time, the outlook for the paper industry is favorable. The price trend for newsprint apparently is upward, and consumption should be fully as good as last year. International Paper, in short, should be able to maintain its current good earnings.

* * *

EVERY COMPANY WILL BE BACK AGAIN

THAT every paper company which exhibited at the Paper Industries Exposition in 1923 would be represented at the Second Paper Industries Exposition at the Grand Central Palace the week of April 7th, was the interesting announcement when the Advisory Committee of the Exposition held its meeting at the Hotel Belmont. The whole status of the Exposition was discussed, and since the meeting letters approving the program have been received from several of the members of the committee who were unable to attend.

The report as to space taken by the paper manufacturers was made on behalf of the Exposition by Charles F. Roth and Fred W. Payne and in every case, it was stated, the exhibitors were returned with as large or with larger space, because of the direct business which was traced to the showing made at the Exposition last year.

Plans are already actively under way for a special program at the Exposition by the Technical Association of the Pulp and Paper Industry, which is holding its annual convention during Paper Week. A program of particular interest to both technical engineers in the paper industry, and the machinery and supply men is being formulated by W. G. MacNaughton, Secretary of Tappi, which is one of the biggest technical organizations in the country of engineers in a special branch of industry.

A noteworthy feature of the space contracts which are being placed is the number of firms making paper products which will be represented. The space assigned to the makers of paper

(Continued on page 29)

BROWN COMPANY OFFERS NEW STOCK

No Difficulty Expected in Disposing of New Stock of Old Corporations

THE Brown Corporation, manufacturers of pulp and woodpulp, is doing additional financing through the issuance of $2,000,000 worth of seven per cent cumulative preferred stock, the issue being underwritten by Hornblower & Weeks.

The Brown Corporation's stock is all owned by the Brown Company, said to be the largest manufacturer of sulphite pulp and kraft wrapping paper in the United States, with mills at Berlin, N. H., and offices at Portland, Me. The Brown Corporation was incorporated in 1905 and operates sulphite pulp mills of 220 tons daily capacity and a lumber mill at La-Tuque, P. Q. Its entire output of pulp and pulpwood is taken by the Brown Company, founded in 1852.

The Brown Corporation's investment at La-Toque represents a cash investment of $6,000,000. In addition there is a developed hydroelectric power plant of 4400 horsepower and undeveloped water power of approximately 140,000 horsepower; its timber holdings comprise about 5,000 square miles estimated to contain upwards of 12,000,000 cords of pulpwood.

The Brown Company owns the entire $9,000,000 common stock of the Brown Corporation and with the reinvestment of earnings, the two companies have combined assets of over $65,000,000. The balance sheet of Nov. 30 shows net current assets of $3,403,000 and other net tanglible assets of $10,307,000, making net tanglible assets of $13,773,000. Net earnings of the Brown Corporation for the past five years, after taxes and interest charges, averaged $670,000 and for the last ten years $608,000.

The Brown Corporations have about 1,000,000 acres in fee simple, 160,000 acres in stumpage and 2,000,000 acres in timber liimts under perpetual license.

Ahead of this issue of preferred stock is a closed first mortgage bond issue of $1,400,000 and after it the $9,000,000 of common stock. H. J. Brown is president of the company.

* * *

Vote To Sell Assets

On February 13 stockholders of the Continental Paper & Bag mills, operating a large mill at Rumford, at a special meeting voted to sell all the assets in the corporation to a new corporation to be organized under the laws of Delaware and to be known as the Continental Paper & Bag Mills Corporation. This action is understood to presage the sale of the plant of the International Paper Co. of Rumford to the Continental Paper & Bag Mills. Deeds for the transfer are now being drawn and both mill properties will figure in the transfer of assets of the Continental Paper & Bag Mills to the new corporation. The Continental Paper & Bag Mills already handles 60 per cent of the output of the International Paper Co., so that the fusion appears very practicable.

* * *

Negotiations Off

Negotiations for the big pulp and paper merger that was to take in the Laurentide, Belgo, St. Maurice and the St. Lawrence companies are off, for the present at least. The explanation is that the terms offered to Laurentide were not sufficiently attractive. The impression among those who know is that the Laurentide Company is much better off for timber than had been supposed, and it is also pointed out that by the time its standing timber will have been exhausted ,a new supply will be available as the fruits of its reforestation policy.

SUIT INVOLVES MILLION IN PAPER STOCK

Stockholder of Eddy Paper Corporation Sues the Company

HEARING of a suit involving $1,000,000 worth of stock in the Eddy Paper Corporation of Illinois was to be started Monday morning before Judge Clayton C. Johnson of Coldwater in circuit court at Centreville, Mich.

The suit is that John C. Maxwell, a stockholder in the Eddy Paper Company at the time the gigantic deal transferring all its assets to the Eddy Paper Corporation of Illinois was consummated. The action, taken at an adjourned meeting of the stockholders, was met with considerable opposition on the part of a minority of the preferred stockholders. The provisions of the transfer converted the entire 700,000 shares of common stock and 177,500 shares of preferred stock in the Michigan corporation into 31,250 shares of no par value stock in the Illinois company and required the latter to assume the entire bonded indebtedness, amounting to $2,250,000, and all other outstanding obligations.

The Maxwell suit, which is merely a test case for scores of others, is based on Section 9050 of the Compiled Laws of the State of Michigan, containing the following provision in effect at the time of the Eddy tranfer:

"If for any reason said corporation shall cease business or become insolvent, then, after the payment of all liabilities and debts, the remainder of the assets of said corporation shall be applied first in payment of all preferred stock in full and then unpaid dividends due thereon, and the balance divided pro rata, share and share alike, among the holders of the common stock."

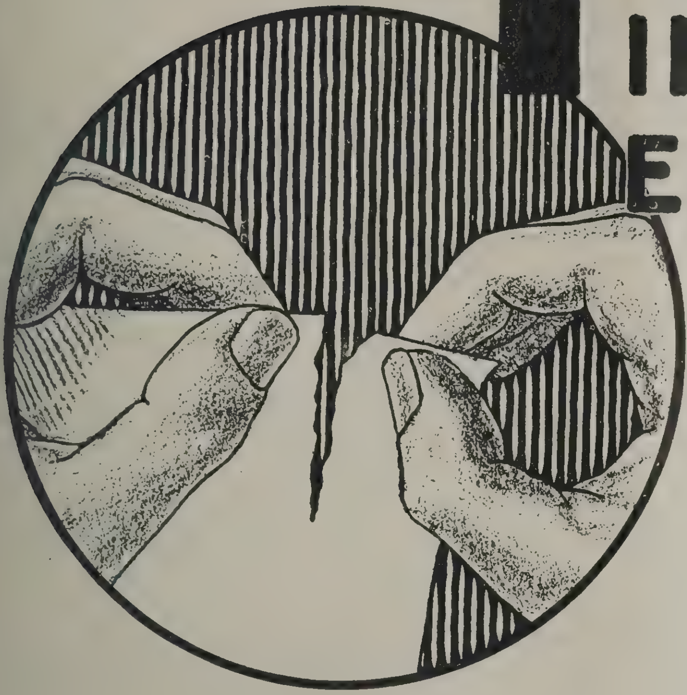
MENASHA, WISCONSIN

The Second Annual PAPER INDUSTRIES EXPOSITION



IF you knew ALL about paper making—your income tax would probably "choke an elephant". But no one man can ever know it all. However, the Paper Exposition projects all the knowledge that has been gained by thousands as on a screen so you may gather quickly the things which will benefit you particularly.

Remember the TIME and the PLACE.

Grand Central Palace
New York City
Week of April 7th

EXHIBIT spaces are being taken rapidly. Has your sales department selected yours yet? If not, write NOW for diagram and costs of spaces.

The Paper Exposition will be on the Main Floor of the Grand Central Palace this year.

One trade paper wrote about last year's Exposition: "The various booths devoted to machinery and apparatus, mill supplies and equipment had a full quota of interested visitors all eager to see or be told about the latest thing in the mechanics of screening, slicing and pumping; the filtration of water, sedimentation and recovery of waste, or perhaps the best method of making rosin size. For the engineer, superintendents or the technical man in a pulp or paper mill some of the exhibitors gave continuous demonstrations of the operations of various modern inventions."

No matter how much you know about paper—or how successful you are—you can get useful and helpful information from the various exhibits and lectures. It will pay you to have all your department heads, as well as yourself, spend one or several days at this Exposition.

Paper Industries Exposition, Grand Central Palace, New York

Paper and Board

New York, February 26—Activity in the paper trade continues on a fairly broad scale although manufacturers and jobbers for the most part are disposed to complain of the limited volume in which buyers are operating. There is still a lack of inclination shown by paper users to purchase other than against direct requirements. Demand is developing in a consistent manner, every day witnessing new business of comparatively broad scope, yet it is quite apparent that the supplies consumers are absorbing are going almost immediately into consumption, printers, publishers, converters and other large users of paper preferring to let manufacturers carry the stocks and therefore placing orders only when the need is pressing.

Prices on practically all kinds of paper are marked by considerable steadiness. It is true that manufacturers in some instances are shading prices in an effort to stimulate demand and also to wean away orders from competitors, but the quotations named in the open market indicate that price levels are well maintained. Moreover, the strengthening of most kinds of raw material recently has had pronounced influence on paper prices. Production costs are doubtless higher at present than they have been since the boom following the war, as raw material prices in a majority of cases have scored sharp advances in recent weeks. It would appear as though some drastic upward revisions in prices of the finished product will have to be effected in the near future if manufacturers are to put paper on equitable price levels with the cost of raw material.

Newsprint is very firm and in a lively market position. Publishers are absorbing print paper in close to record tonnage, and a pleasing feature in this branch of the industry is that mills almost as a unit are sold up for sometime to come. In fact, most newsprint manufacturers have little or none of their potential output for the first half of the year to dispose of, having contracted with publishers up to the very hilt of their production. Newsprint is moving straight into consumption. Very little is being stocked as consumption is so heavy that publishers have practically no supply over their contract commitments to place in store. Mills also are shipping out print paper about as rapidly as it comes from machines, and manufacturers' stocks according to latest available figures, are below normal.

Coarse papers are doing fairly well. At any rate the market for wrapping paper seems to have steadied down to a more even keel, with demand developing in a more consistent way and with domestic producers seemingly securing a larger proportion of the current business than they did a short while ago when tremendous quantities of kraft paper came into the United States from Scandinavia and Germany. Prices have steadied at levels where it is declared manufacturers have little or no margin for profit, and it is argued that such prices cannot prevail indefinitely.

Fine papers are tending to advance. This branch of paper manufacturing has felt the rise in raw material costs probably to a keener degree than any other group of mills, and increasing demand for bonds and ledgers also is a factor aiding in the firmer tone of fine paper prices. Mills in New England are reported gradually increasing their production to keep pace with the expansion of demand, and fine paper plants in the Middle West are said to be enjoying favorable market conditions.

Book paper is moving in a steady manner and at maintained quotations, with prices exhibiting a hardening tendency. Tissue papers are rather quiet but no further changes are noted in quoted prices. Building papers are active, and so are bag papers. There is an especially strong demand for roofing felt both from domestic sources and for export, Japan being a heavy buyer, according to reports.

Box boards are in fair demand. It is quite evident that consumers are buying to cover immediate wants but the movement of board is of at least normal volume. Prices are fluctuating up and down rather frequently though the changes are of

Mechanical Pulp

Probably the most important development in mechanical pulp is the reported closing down of grinding mills as a result of unfavorable weather conditions. Mill streams in various parts of this country and Canada are frozen tight, and with the water supply greatly reduced, some grinders have been obliged to very nearly discontinue producing temporarily. This, as would be expected, is having a strengthening influence on the market, and ground wood quotations from many quarters show an advancing tendency. Domestic producers are generally securing from $35 a ton upward f. o. b. pulp mills for prime ground wood for prompt shipment, prices of course depending on the air dry test and the freight to consuming points, quotations ranging up to $40 per ton with manufacturers getting this price for pulp for short hauls. Imported ground wood is quoted on the spot at New York at $35 a ton ex dock though most sales are at slightly under this level or between $33 and $34.

Foreign and Domestic Chemical Pulp

Demand for chemical wood pulp continues to develop in a comparatively slow manner, and paper manufacturers with few exceptions are purchasing only when their requirements necessitate the absorption of fresh supplies. Nevertheless the market tone is distinctly steadier than it has been in the recent past, and sentiment is almost univeral in the trade that bottom prices have been seen and that any change from now on will be in an upward direction. As a matter of fact some kinds of pulp display a strengthening tendency. Kraft is unmistakably steadier, due in large part to a firming up of prices at primary sources abroad, and practically no No. 1 Scandinavian kraft pulp is now available at less than 2.50 cents per pound ex dock New York with some importers quoting a dollar or two per ton above this level. Sulphite is moving along in a routine way with offered supplies of a volume having a more or less depressing effect on values. Foreign bleached sulphite is quoted at from 3.75 cents upward per pound on the dock, depending on the grade, and strong foreign unbleached sulphite is quoted at about 2.60 to 2.65 cents ex dock New York. Quotations ex dock at this port and f.o.b. pulp mills are as follows:

Domestic Rags

After having shown a weakening trend for a matter of several days, prices of the low grades of papermaking rags as chiefly used by roofing paper mills have again adopted a rising tendency, while the medium and high qualities rule very firm under a strong demand from numerous consuming sources. Doubtless the heavy snow storms over a large part of the country have been a factor in firming rag values, since collections have decreased as a result and dealers therefore having less stock to dispose of. Sales of No. 1 roofing rags at around a price basis of 2.60 cents per pound f. o. b. New York have been reported, and No. 2 packing has brought 2.40 cents New York. Old thirds and blues are in active demand and quotably firm. Repacked are selling at 3.50 to 3.75 cents per pound at dealers' shipping points, and miscellaneous blues at 3.25 to 3.50 cents. New cuttings are gradually moving higher in price and some grades are

The Pickles Drying Regulator

Reasons why you should have it on your machine are: First, it regulates the drying of paper automatically, irregularities are eliminated; second, higher machine finished papers are attainable, because it is possible to maintain the proper quantity of moisture in sheet, as it passes to calenders; third, mills having tried it on one machine have ordered it for all their machines. Full particulars upon application to

				Roofing Rags, No. 2	2.40	@	2.50

Imported Rags

Foreign papermaking rags are firm in price and are meeting with a consistently good demand. Importers assert that prices abroad are mounting at a rapid rate and that in frequent cases they are asked to pay higher figures than can be secured from paper mills in this country. Dark colored cottons are selling at about 2.50 cents per pound ex dock New York though most importers ask above this price. No. 1 new white linens are quoted at 15 cents per pound and higher, and old No. 1 white linens at round 11 cents. Quotations ex dock New York follow:

Lins., White, No. 1	15.00	@	16.00	German Linen, blue	4.50	@	5.00
Ger. Blue Cottons	3.50	@	3.75	German Linen, grey	6.00	@	6.50

New Unbleached	10.50	@	11.00	Dk. Colored Cottons	2.50	@	2.65

Bagging, Rope, Etc.

Old rope is firm in price and is moving to paper mills in good amounts. Domestic manila rope of No. 1 grade is selling at 6.50 to 6.75 cents per pound at dealers' shipping points, and reports say that most sales are close to the top figure. Strings have firmed up, dealers asking 1.25 to 1.50 cents a pound at shipping points. Old bagging is in little demand excepting from roofing paper manufacturers who are buying in larger than usual volume. Mixed bagging for roofing mills is reported fetching 1.60 cents a pound New York. F. o. b. New York quotations are:

Gunny No. 1	1.50	@	1.60	Roofing Bagging	1.50	@	1.60
Foreign	1.40	@	1.50	For. Manila Rope	6.25	@	6.50

Wool Tares, heavy	1.50	@	1.70	Mixed Strings	1.25	@	1.50
Scrap, Bagg., No. 1	1.50	@	1.65				

Old Paper

Signs point to a slight easing of prices of most grades of old paper. Demand for the better qualities is decidedly slow, and buyers looking for such grades are generally filling their wants at concessions from the prices asked by dealers, while the movement of the low qualities has decreased sufficiently to effect some sagging of prices. Shavings are little wanted by mills, and No. 1 hard white shavings are reported available at 3.75 cents per pound f. o. b. New York and No. 1 soft white at 2.90 cents New York. Old newspapers are selling at 95 cents to $1 a hundred pounds f. o. b. this city, No. 1 mixed papers at 75 to 80 cents common paper at 55 to 60 cents, and flat magazine stock at 1.60 to 1.75 cents per pound. Old kraft is firm with sellers quoting 2.25 cents a pound New York. Quotations f. o. b. New York are as follows:

No. 1 Hard White Shavings	3.75	@	4.00	Ledger Stock	1.90	@	2.10
No. 2 Hard White Shavings	3.25	@	3.50	Kraft, No. 1	2.25	@	2.35

				White Blank News	2.25	@	2.35
				Common Paper	.55	@	.60

Twines

Twine prices show very little or no change although the tone is firm and the strong position of raw material makes for an upward tendency. Demand is of routine character and is probably a little less in volume than is usually experienced at this time of the year. All grades, however, are sharing in the movement, with the demand lacking feature. Quotations follow:

Sisal Hay, pure	12.25	@	13.25	Jute Wrapping twine, A grade	20.00	@	
Manila Hay, pure	16.25	@	17.25	Papermakers Twine	11.50	@

specialties is already overflowing, and among the displays of this group will be some of the most unique features of the Exposition. Paper cups, boxes, bags, form a small part of this department, which will be one of the most popular phases of the big paper show for the general public which will attend.

Direct mail advertisers will find that the paper manufacturers will give them a particularly fine opportunity to learn of the paper problem, which is so important in their preparation of advertising copy. Most of the big direct mail advertising houses no longer depend on the judgment of the printers for the selection of the paper needed, but specify the grade and quality which will give the type and illustrations the most attractive presentation. The Paper Show will by its showing of variety of papers, and the special service to be rendered by the exhibiting companies give the direct mail advertiser the best opportunity imaginable for studying paper, as the material on which the success of his printed matter depends.

* * *

The Riddle of Cellulose

(Continued from page 8)

exist in cellulose per se, but is formed from anhydroglucose by condensation.

It will be evident from the foregoing and from Professor Wise's contribution that cellulose chemistry is destined to be a subject of investigation for many years to come. Organic chemical research is difficult to popularize and results cannot be given in a trade journal with the fullness of detail that workers on organic chemical problems might desire, but the effort should be made to keep readers of a technical journal of papermaking such as PAPER, informed of developments in the field of chemistry as well as those in the fields of engineering and mechanics, if it can be done attractively without the use of too many recondite formulas and terms, which is what I have attempted conscientiously to do in this latest account of efforts to solve the riddle of cellulose.

ORR FELTS
and JACKETS

Lowest Cost per Ton

If you judge felt values, not by what you put into the equipment, but what you get out of it—then you will specify ORR 3 stripe Endless Felts for ORR felts will produce the lowest cost per ton. They "stand up" under severe usage. Orr durability is acknowledged everywhere. Their strength and long life are as dependable as their reliability and quality.

In the 32 grades of Felts and Jackets we can match your most exacting demands. Tell us the kind of paper you desire to make, and we will send you samples of felts that will economically serve you and help you to produce paper at lowest cost per ton.

Paper Testing Methods
(1922)

A large edition of this handbook for paper mill laboratories was exhausted shortly after the type had been distributed. In view of the insistent demand the Technical Association has arranged for a republication and *Paper Testing Methods* is again available at $3 per copy.

The work covers detailed procedure for microscopical analysis, physical testing and chemical analysis of the paper with descriptions of the apparatus employed.

It is the only complete and up-to-date handbook on paper testing published in the English language.

It should be in the hands of every paper manufacturer and paper dealer as well as concerns who are large users of paper.

Hamilton Board Felts

OUR style No. 82 top felt and style No. 87 bottom felt have the bulk of the filling threads on the face of the fabric. This style of weave causes the felts to give a smoother finish and longer service than can be secured from plain weave board felts, besides shedding the water better. They do not "roll on the edge" and are billed at the same list and pound prices as are our plain board felts.

MATHIESON System

Can You Read Between the Lines?

THE Mathieson Multi-Unit Chlorine Tank Car has been approved by the Interstate Commerce Commission. Our specially designed car carrying fifteen one-ton containers of Liquid Chlorine, instead of a single fifteen-ton tank, is now entitled to the same freight rates and privileges as other tank cars.

To the Pulp and Paper Industry, this decision means official approval of a tank car construction ideally adapted to the safe, economical and convenient use of Liquid Chlorine. The Multi-Unit Car, with its individually-weighed containers of exactly two thousand pounds net, provides an accurate unit measure for preparing uniform bleach liquor. In checking and stock-taking there is never any uncertainty as to the quantity of Liquid Chlorine received or on hand.

Over two years ago we voluntarily went to the expense of designing and placing in service the Multi-Unit Tank Car. Upon refusal of the railroad companies to allow us tank car rates, we appealed to the Interstate Commerce Commission for removal of this discrimination, and continued making shipments in our special car. We have assumed all excess freight charges on every movement of this car and during the past two years have paid out over two hundred thousand dollars in order that consumers and the general public might enjoy the many advantages realized in this type of equipment. The recent ruling of the Commission awards us full reparations with interest and completely vindicates our faith in the Multi-Unit "Safety First" principle.

To those who will read between the lines, the story of the Mathieson Multi-Unit Tank Car will exemplify the sound, constructive policy that has made us the leaders in the Chlorine Industry.

A Few Stray Thoughts

JUDGING from the stories now appearing in PAPER, it is high time the paper industry looked to its future. Perhaps, it has a scandal of its own as vital and amazing as the muddle being brought to light in Washington.

Certainly, it is high time thought was being given to the question of imports, dumping, and the trade in general.

It does no good to lament lugubriously and soulfully like a dog baying at the moon, unless efforts are put forth to find the cause of the trouble. Lamentations are useless. What is needed now is acumen and energy in going to the bottom of the trouble, and definite, absolute action in remedying the trouble.

* * *

The words, written by B. T. McBain in this issue regarding Judge Moore are the honest expression of a man who knew him well.

It must be a glorious thing to be so well thought of. Just to reach such a pinnacle is aim enough for one lifetime.

* * *

The second part of the series of Sulphite Mill Calculations by Mr. Van Arsdel appears in this issue. Here is something down on paper that many a man in the sulphite mill has longed for. The calculations set down required long, painstaking work to compile. They should be used to the limit by the sulphite mills of the country.

* * *

March is here. April is near by. Convention time approaches. It is only a month away. It is time now to get your reservations made in the Second Paper Industries Exposition as well as to lay your plans for spending the week of April 7 in New York City. It will be a week of rare pleasure for all who attend, as well as one of instruction.

By the way, preparations are going on steadily for the big Convention Number of PAPER. This will be the most comprehensive document covering the convention it is possible to secure. It is time now to get in that special advertisement telling of your good will to the trade and telling the world what you have to sell.

This Convention Number comes out only once a year and will be well worth your patronage.

* * *

There is one thing about it, Attorney General Daugherty seems to have sufficient to think about these days without cogitating on how to break up trade associations like those in the paper industry.

* * *

Well, there hasn't been a failure of consequence in the paper industry for days, perhaps weeks. Everything is looking up, if you please.

* * *

The Canadian Embargo seems to be going back into unconsciousness, once more. The movement has apparently worn itself out. Whether it will now disappear into oblivion is not known. Anyway, everybody is pussyfooting about it now.

* * *

Some engrossing facts are given by R. S. Kellogg in his address before the Kiwanis Club of Poughkeepsie regarding the newsprint situation. His address appears in this issue. One has no idea what the magnitude of the paper industry is until such facts are brought out.

* * *

We would like to remind you once more, that, right now, PAPER is the livest weekly publication in the paper industry. And do you notice the scads of news in each issue? There is something from all parts of the country.

Manufacture of Mechanical Pulp

Action of Different Burrs in Grinding Wood Is Governed by Many Factors Which Are Here Explained

By I. H. COPELAND
Manager of Pulp Department, Tidewater Paper Mills Co., Brooklyn, N. Y.

IN a discussion of this subject, one will probably find a great variety of opinion as to the results obtainable through the use of any particular burr or combination of burrs. This is explained to some extent when we think of some of the factors which influence the results. First there is the way in which the burr is used, i. e. the care which is taken in dressing the stone and in keeping it in good condition. Second the temperature of the stock in the grinding pit. Third the speed and pressure ratio and the amount of power used per stone. Fourth the kind of wood used and fifth, the character of the grindstone. There are other factors but I think that these are the most pertinent. I shall not attempt in this article to cover the action of burrs under different operating conditions but shall describe the action of some different burrs and combinations of burrs, when used under average running conditions and with an average run of wood.

There are hundreds of different cuts, pitches, leads, shapes and types of burrs in use in the groundwood pulp mills of the world today. Not so many years ago, cast iron disks with any required number of teeth to the inch cut into their peripheries were used for roughing the surface of the stone. No definite pattern was made upon the stone surface but the surface was roughened so that it would grind wood. When the stone was considered to be too sharp and the resultant pulp too coarse a brick or a plane iron roller was passed across the surface of the stone. This had a tendency to break down some of the rough cutting surface and fill up the grain and a finer pulp would be the result. Today these disks or sectional burrs find little use except for truing up stones.

At the same time that the sectional burrs were in use the solid burr was also largely used for stone dressing. The solid burr is a steel cylinder on which can be cut any desired pattern which it is intended to transfer to the stone. When the burr becomes dull it can be recut in the mill machine shop and used over again. There are many reasons why this burr is not now practical when shell burrs can be obtained at a moderate price, but it is sufficient to say that the cost per ton is lower for the shell burr and at the same time much more uniform results are obtained.

The steel shell burr can be seamed so as to make any desired pattern. The shell is placed upon a mandrel which runs on roller bearings. The shell burrs are made in two sizes—3½ inches and 3⅞ inches inside diameter. The larger burr is to be preferred as it runs more smoothly on the stone, there being less chatter, while the resultant pattern on the stone is more uniform.

The disk burr, being a shell burr supplied with a light mandrel inside, is lighter than the ordinary shell burr together with the usual mandrel employed and it is asserted still further reduces the chatter and vibration.

The bevel burr, a recent invention, is a great aid in keeping a uniform pattern on the stone surface and in producing a uniform pulp. Any type of burr can be made with a bevel edge which prevents the teeth from digging their corners into the stone. The greatest advantage of the bevel burr is that it is more foolproof than other burrs.

While burrs are made in many different types, leads, pitches, cuts, etc., they are usually fashioned in some type of straight cut, diamond, spiral, or thread burr.

Straight-cut Burr

In the case of a straight-cut burr (No. 4 is most commonly used), the impression is first put on with the straight-cut, after which a No. 14, No. 12, or No. 10 diamond is used to face off the stone and square the edges of the impression. The kind of diamond used depends upon the nature of the particular stone to be treated, the speed and pressure ratio and the kind of wood being ground. This combination will produce a strong long fibered pulp with a low percentage of waste.

Spiral or Diagonal Burr

The No. 4 spiral burr can be used in a similar manner to the No. 4 straight-cut. The resultant pulp will be long, strong, and uniform but will be slower than that produced by the use of the straight-cut. In the case of the finer cut spiral burr No. 8 for example, this being the cut most generally used, the stone should be frequently cleaned up with a No. 14 diamond before dressing with the spiral. The resultant pulp is a fine silky fiber of fair length but it does not possess the same strength as that obtained with the coarser cut burr followed by the diamond.

Thread Burrs

As the lead of the spiral burr is increased, the resultant pulp becomes shorter. When the lead is sufficiently increased it becomes a thread or screw burr. This type of burr produces a very fine pulp of very short fiber, and a large proportion of floury stock. It is often used when a very fine sheet of paper is required, or when the pulp is to be used on slow machines and there is no particular desire in mind to economize on sulphite. In dressing with this burr, the burr should be moved across the surface of the stone very slowly in order to prevent it jumping out of its groove.

Diamond Burrs

This burr is best used in combination with another burr, though many mills prefer to use it alone. Unless production is sacrificed in order to produce a good quality, the resultant pulp is lacking in strength. The diamond burr has a tendency to produce a short free stock.

Burrs That Give Best Results

From the standpoint of production and quality, some type of the straight-cut or spiral burr used in combination with the diamond, will give the most satisfactory results.

No matter what burr is in use, it is advisable to have the stone surfaced off occasionally with the No. 14 diamond. This burr has many uses; when using a coarse burr for marking the stone, the diamond is used for squaring the edge of the impression and opening the grain between the marks. When using a fine marking burr, the diamond is used for facing the stone and leaving a smooth surface for the marking burr to pass over. When the stone surface becomes glazed, the diamond can be used to open the grain again When the pulp is too coarse, a light touch with the diamond will reduce the waste and improve the quality without reducing the production.

General Observations

While there are some who might dispute this statement the majority of manufacturers who have given it a trial have found that no matter what speed and pressure are used, or what kind of wood is being ground, the best all round results are obtained by the use of the flat-bottom burr. The name describes the burr, as it means a burr with a flat bottom between the teeth. Unlike the V bottom burr, the teeth are made as fine as possible, consistent with strength; until it is badly worn this burr does not have a blunt edge which breaks up the pattern on the stone. If a new V-bottom burr were used each time, practically the same results would be obtained as through the use of the flat-bottom burr. The foregoing applies to the marking burrs and not to the diamond. It is impossible to obtain good results through the use of dull burrs. It is not necessary to discard a burr after it has been used a few times if the teeth are still in good condition but when the teeth become worn down, it is more economical and greater efficiency is obtained by throwing the burr away and using a sharp one.

Frequency of dressing varies very greatly under different conditions. It is, however, always preferable to dress light and often in preference to marking the stone too heavily. While the pulpmaker is the governing factor, mechanically at least the burr used is a mighty important feature of the groundwood process. If the right burr or combination of burrs, to suit the mill conditions, is used intelligently, it is usually possible to obtain the right quality of pulp, provided the other mill conditions are not abnormal.

Most mills today are equipped with either hand-screw or hydraulic lathes. It is essential that these be kept in good condition. The pins in the burr holders should be renewed as soon as they become worn and everything possible should be done to eliminate play and vibration. It is just as important to have everything in shape to do a good job with the grinder lathe as with the lathe in the machine shop. The groundwood process is like many other things: the *little things* that nine out of ten people overlook are very often the things that count the most.

* * *

New Brand Names

Applications for registration of the following brand names have been made in the Toilet Paper Label Registration Bureau of the Tissue Paper Manufacturers Association:

From January 20, 1924, to and including February 20, 1924:

Arrowhead—Continental Paper & Bag Mills, New York, N. Y.
Boy Scout—Union Selling Co., Cincinnati, Ohio.
Earlsbest—National Paper Products Co., San Francisco, Cal.
Inter Ocean—Inter Ocean Bag & Paper Co., Chicago, Ill.
Jowada—Fort Howard Paper Co., Green Bay, Wis.
Laroma—Fort Howard Paper Co., Green Bay, Wis.
Red Top—Union Selling Co., Cincinnati, Ohio.
Repeater—Inter Ocean Bag & Paper Co., Chicago, Ill.
Sambo—Union Selling Co., Cincinnati, Ohio.
Sea Foam—Union Selling Co., Cincinnati, Ohio.
Target—Inter Ocean Bag & Paper Co., Chicago, Ill.
Tuscan Toilet Paper—Pelican Paper Co., San Francisco, Cal.

The following brand names have been registered in the Toilet Paper Label Registration Bureau of the Tissue Paper Manufacturers Association:

From January 20, 1924, to and including February 20, 1924:

Blue Rose—Fort Howard Paper Co., Green Bay, Wis.
Busy Bee—Gotham Tissue Corporation, New York, N. Y. (Taxin & Shapiro)
Dandelion—Ajax Paper Mills, New York, N. Y.
Try the Drug Store First—A. R. Rapp Co., Chicago, Ill.

The following appeared in recent issues of the official gazette of the United States Patent Office:

Trade-Marks Published for Opposition

O. G. of December 25, 1923, Serial No. 184,357.

Northern Cabinet Tissue—A picture of the label consisting of an oblong flanked on both sides by other oblongs with fir tree scenes, the main oblong having the words, "Northern Cabinet Tissue." Northern Paper Mills, Green Bay, Wis. Published for opposition December 25, 1923. Claims use since January 24, 1921.

O. G. of December 25, 1923, Serial No. 186,745.

Maid of the Forest—Fort Howard Paper Company, Green Bay, Wis. Published for opposition December 25, 1923. Claims use since March 17, 1923.

O. G. of December 25, 1923, Serial No. 186,953.

Snobloom—Fort Howard Paper Company, Green Bay, Wis. Published for opposition December 25, 1923. Claims use since November 2, 1922.

O. G. of January 8, 1924, Serial No. 186,533.

Laddie—Wortendyke Manufacturing Co., Richmond, Va. Published for opposition January 8, 1924. Claims use since September 1, 1923.

O. G. of January 15, 1924, Serial No. 183,864.

(Drawing consisting of hexagonal perforations between the two sheets of paper.) United States Envelope Company, Springfield, Mass. Published for opposition January 15, 1924. Claims use since January 1, 1889.

Trade-Mark Registrations Granted

O. G. of January 1, 1924, Serial No. 181,437. Registration No. 177,862.

Dupasco—(Design consisting of an outline of the head of a moose across which is written the word, "Dupasco.") Duluth Paper & Stationery Co., Duluth, Minn. Published for opposition October 16, 1923. Claims use since about 1910. Registration granted January 1, 1924.

O. G. of January 8, 1924, Serial No. 185,163. Registration No. 178,053.

T. F.—(Outline of an evergreen tree done in bold in the center of which is a circle containing the letters T. F.) Taverner & Fricke, Los Angeles, Calif. Published for opposition October 16, 1923. Claims use since January 29, 1920. Registration granted January 8, 1924.

O. G. of January 8, 1924, Serial No. 184,355. Registration No. 178,088.

Mermes—(Classic design showing the profile of a woman's head below which is the word, "Mermes.") Northern Paper Mills, Green Bay, Wis. Published for opposition October 16, 1923. Claims use since January 3, 1923. Registation granted January 8, 1924.

O. G. of January 8, 1924, Serial No. 184,352. Registration No. 178,094.

Fairy—(Design consisting of an oblong showing the sky with the moon, stars and fairies floating around, and the word, "Hairy" at the bottom of the oblong.) Northern Paper Mills, Green Bay, Wis. Published for opposition October 16, 1923. Claims use since March 15, 1904. Registration granted January 8, 1924.

O. G. of January 8, 1924, Serial No. 184,360. Registration No. 178,146.

Red Poppy—(Design consisting of an oblong divided into three parts: the ends having horizontal black and white bars and the center having an oblong framed picture of a poppy and the words, "Red Poppy" written to the left of the picture.) Northern Paper Mills, Green Bay, Wis. Published for opposition October 16, 1923. Claims use since August 31, 1921. Registration granted January 8, 1924.

O. G. of January 8, 1924, Serial No. 185,623. Registration No. 178,268.

S* P* Co.—(An oblong with curved corners and containing the letters S* P* Co.) Scott Paper Company, Chester, Pa. Published for opposition October 23, 1923. Claims use since March, 1907. Registration granted January 8, 1924.

O. G. of January 15, 1924, Serial No. 182,117. Registration No. 178,726.

Paris—The Tuttle Press Company, Appleton, Wis. Filed June 16, 1923. Claims use since 1905. Registration granted January 15, 1924.

Imports and Exports

Second of a Series of Articles on a Situation That Is Vital to the Paper Industry

Where Does The Blame Belong?

WHERE does the blame belong for the alleged dumping and rumors of dumping by European untries of paper and pulp in Amer- a, sold scandalously cheap?

Why can't it be stopped—if it is ue?

Who is to blame for the thing?

According to the information gleaned PAPER in various sources, the ame solely and entirely is on the permakers and the paper trade gen- ally.

For until evidence is gathered that e Anti-Dumping law is being evaded thing on this green earth can be done, cept prayer to the Almighty that a iracle happen.

And who will gather the evidence t the papermakers and those inter- ted in the paper trade? The govern- ent is twisted into a Gordian knot er the oil inquiry and the reduction taxes. Other trades don't care a hoop about conditions in the paper ade. They have troubles of their vn. It is strictly and absolutely up the paper trade alone.

This was made plain by E. J. Dough- ty, head of the Anti-Dumping Unit the government appraisers at the ort of New York, in an interview anted to PAPER. He is ready and illing to take immediate legal action henever evidence reaches him in con- ete form that a specific case of dump- g has arisen.

The most difficult obstacle to over- me is that proving there is injury to e business of this country, according Mr. Dougherty.

He brought out that the Anti-Dump- g law is like all laws, several vital cts must be proven before there can any action.

If a country produces more paper an it can use, or if the normal ex- rts of paper are greater than the me consumption, then allowance is ade for that.

Furthermore, it must be known at the paper or pulp is being sold in merica cheaper than it is sold at me.

Or, on the other angle, the fraud volved in changing classifications ust be shown absolutely and without e semblance of a doubt.

All of these require evidence, especially the clause referring to injury to the business of this country. This latter question is like the one regarding how many drinks are required to make a man drunk?

Only One Case

In all the recent history of the Anti-Dumping Law, with American papermakers tearing their hair with rage at alleged infractions of the law, with the certain knowledge in their own minds that there is a dark hued baby in the woodpile, only one case has been brought up for trial. This was in the case of Norwegian kraft paper. And it was all white-washed out immaculately in the hearings, for no proof was brought to show that it was dumping. The fact that it was not selling below the price in Norway and that Norway normally exports more paper than she uses herself saved the day.

Just one in scores of rumored cases. And that not amounting to a thing.

There is something wrong with the approach of the execution. There is not, however, any doubt as to the seriousness of the situation. In the issue of last week, Warren B. Bullock, in an article especially prepared for PAPER gave the facts and figures showing how the trade balance regarding paper is extremely adverse. The figures showed coldly and plainly that while the exports remained about the same in both the years of 1922 and 1923, the imports increased from $85,854,357 to $116,137,795. This is an increase of some 50 per cent. At the same rate of speed for a few more years there would be no paper industry in America whatever.

Various subterfuges are being operated right under the eyes of the officials, some of them legal, some of them not. Until the proper evidence is produced, however, nothing can be done. And it is up to the paper men of the country to get this evidence.

The Consignment Plan

One much used, and perhaps legal, plan is to ship large quantities of goods here on consignment, with the blanket order to get what can be got for it. This is dumped on the market at any old price and immediately, from the yells of the consumer, the American paper industry is largely composed of yeggmen and highwaymen.

There have been times when paper was shipped here and then exported to another foreign company cheaper than the American industry could export it once. This is another much liked plan of killing the American industry.

Germans Biggest Offenders

The Germans, according to disclosures made to PAPER, are the greatest offenders and really the key to the entire situation. The German situation will be taken up in detail in the next article.

In one case German paper was shipped here, purchased by a firm, and then sent to Cuba at a rate two cents a pound under the price of a domestic export company. It was bond paper.

Other schemes used, according to the information, are to send high quality paper like bond into this country in rolls, something not usually done. It is labelled "Newsprint," comes in free of duty, and then is cut in sheets on tiny marks put in for the guidance of the converter. There is nothing legal in this.

Only Rumors

There are other rumored cases by the score. The difficulty is that there is no concrete evidence on which to base action.

Importers of German and other European countries' product, contend, like one Mr. Doheny remotely connected with the oil business, that there is no dumping. Judging from the number of discovered violations, there is no dumping question. It is merely a bugaboo. They say the mere fact that goods are sold here cheaper than the goods of the American mills is no reason to think there is dumping. The importers of German goods are frank in saying that the American paper industry is merely frightened to death. It is using the dumping idea as a handle on which to hang a protest.

These importers are the most sanguine people in the world. They are confident that imports will steadily increase for years to come. In fact, if they do not increase, they are satisfied. The balance is comfortable for them right now. Basing their calculation on the last two years they see only roseate, glowing prospects for the future.

Everywhere interviews were given, the idea sifted out, that the paper trade itself is to blame for this state of affairs.

If they will not gather evidence there can be no action. If they do gather evidence it must be the right kind. Then the proper action will be taken.

That the matter is vital to the paper industry is shown by the recent activity of the American Paper and Pulp Association. Paper has long been in touch with the association regarding this matter.

Under the caption, "Import Crisis—An Emergency Service," Dr. Hugh P. Baker, executive secretary of the American Paper and Pulp Association, has sent the following announcement to members of the Association:

"The seriousness of the paper imports situation, with wrong classification, dumping and actual undervaluation of foreign importations, has forced emergency action by the American Paper and Pulp Association.

"The ordinary activities of the Information Service, and the publication of the monthly bulletin will be discontinued temporarily, and Mr. Warren B. Bullock thereby relieved to devote his attention to the import situation in both pulp and paper. He will go into the field at once making investigations at ports of entry to secure the evidence necessary to check the abuses of the customs laws."

In discussing this action, Dr. Baker said:

"We have been working on this matter for months, to determine the exact situation as regards imports of foreign paper. Mr. Bullock has paid visits to Philadelphia and other ports of entry, and spent part of the present week in Boston, where he found as at other ports, that every effort is being made by the importers to bring in paper under classifications that constitute an evasion of the payment of the proper duty. Our decision to have him devote his entire time to this work is the result of these preliminary suggestions."

While Mr. Bullock will now devote all his time to this question, he has long been spending much of his time sec ing evidence and quietly working ou plan of action. The article last w in PAPER was the opening gun a the first public announcement of h serious the matter is regarded.

It is obvious to the entire trade t the American paper trade cannot h another year with the import situat like it was last year. To do so wo be almost ruinous. There is hope, course, in the fact that the domes demand is large, but that consumpti is being undermined by the forei product steadily.

The only hope in aiding the dumpi situation is in the expenditure of requisite effort to secure the pro evidence. The fact that the appraise office in the United States finds goo valued at prices far under Americ prices is of no use, under fraud labels is proven, that the product being sold here for less than in own country and the various other tails called for by the law.

As to the tariff end of the matt itself, that will require further d cussion.

Waste in Pulp and Paper Industry

Judge Moore's Book

By: **B. T. McBAIN**

Assistant General Manager, Nekoosa Edwards Paper Company

ONE of the outstanding characters in the American Pulp and Paper Industry for many years past has been Judge Moore. His articles in the Trade Papers and his speeches before our Conventions have been the talk of the Industry during this entire week.

Judge Moore is now confined to his bed and is not likely to get around again for many months with the chances against him for complete recovery, though the Prayers of his many thousands of friends in the Industry should cause a miracle to be performed, the Great Ruler of the Universe being willing.

But Prayers and Miracles set aside, what is needed now in addition is the more substantial Coin of the Realm and this must be forthcoming.

The Judge's articles, many in humorous vein, are obtainable in book form and friends have taken the matter in hand to try to get a copy of this book into the hands of everybody interested in the manufacture of Pulp and Paper; not as a matter of charity, for that is not the idea or the purpose, but as a matter of duty first and a matter of business as well.

But, while there are 6000 people in the Pulp and Paper Industry who should now have this publication in their Library less than 1000 have taken advantage of the offer of the Committee in charge.

This little bit of information is being published under the writers well known heading "Waste in the Pulp and Paper Industry" first because it will be read by many and may in the end help the sale of the Judge's book, but chiefly to show how we all will waste time. We receive letters and put them aside meaning all the time to act. We check them over from day to day, piling first on one side of the desk and then on the other thinking we haven't time then to write and order and send the check. Then a second notice comes. This is filled or piled up with the first one waiting for a more opportune time to attend to the matter. Our memories are poor; the matter is forgotten—our own time in many times greater amount has been wasted in procrastination and the time of the Committee handling the matter for Judge Moore is wasted as well.

Why not act now? You will in the end. Do it today and Save Waste.

* * *

TO COOPERATE IN BIG ARTS EXPOSITION

Paper Industry To Lend Aid In Making Event Success

THE paper industry already is perfecting its plans to co-operate in the third annual graphic arts exposition to be held in Milwaukee August 18 to 23 under the auspices of the Milwaukee Club of Printing House Craftsmen. Headquarters for the show have been opened in the Hotel Pfister and inquiries being received by the Milwaukee committee in charge indicate the success of the exposition which is to be staged in the mammoth Milwaukee Auditorium, a building covering a square block and considered one of the b in the country for convention purposes.

Milwaukee, as the center of a large and pr lific paper and pulp producing territory, pr vides a great market for the products of t manufacturer serving this industry and t graphic arts exposition is expected to be meeting place for all those using and man facturing paper in its many forms.

Preparations for the exposition have be going on many weeks and the craftsmen sta ing the show some time ago incorporated und the laws of Wisconsin to smooth the w for those whose function it will be to admi ister the exposition.

It is the purpose of those back of the sho to make this year's proposition more con pletely representative of the pulp and pap manufacturing industry than any previous held.

Exhibit is the purpose of those back of t show to make this year's exposition most con pletely representative of the pulp and pap manufacturing industry than any previous held.

Exhibit space at the Auditorium is expecte to be completely filled with the latest pu and paper machinery which will be viewed b 150,000 visitors, many of them executives the paper, printing and lithographing in dustries.

Diagrams of space already are available an applications are being accepted at the hea quarters in the Hotel Pfister.

The association is for trade education ex clusively and no discussions of wages or hour will take place at any of the meetings. Th exposition is not conducted for profit and th time of those interested in making it a suc cess is given without pay.

The Paper Age We Live In

Never Enough Paper Available Till We Turned To Wood And There's only 25 Years' Supply in Sight—Two-thirds of the World's Consumption of Paper Produced and Used in North America—Russia Uses 6 lbs. a Year per Person, Compared with 150 lbs. in United States

By ROYAL S. KELLOGG
Secretary of News Print Service Bureau

SPEAKING at the noon luncheon of the Kiwanis Club, of Poughkeepsie, N. Y., on March 4, R. S. Kellogg, secretary of the News Print Service Bureau, presented a most interesting set of facts bearing on the newsprint paper situation in North America. He spoke in part as follows:

"Before I say anything about newsprint paper in particular, I should like to call your attention for an instant to the function that paper plays in the world at this stage of our development. We are so used to having paper that scarcely ever do we realize what it means to us. People who dig through ancient history and still more ancient history tell us man has passed through a stone and bronze age into a steel age. We are passing into a paper age. If you have any doubt of that, think what would happen if some great catastrophe should wipe out all the paper that there s in the world. Civilization would be n utter chaos by tomorrow. We depend absolutely upon paper for every kind of purpose, particularly for business purposes, since probably 95 percent of our business is done through paper and not through cash or actual exchange of commodities.

Never So Cheap or So Abundant

"Paper is now so cheap and abundant that we don't think about the time when it was not, and yet the memory of á great many men can go back to hat time. One of the most remarkable hings that we find as we look back into he earlier stages of civilization was the remendous search for materials upon which human opinions and human records could be written down and used by later generations. The word paper' itself comes from 'papyrus,' the name of a water sedge that grows along he Nile in Egypt. For 5,000 years writing material made from papyrus urnished the best recording material he world had—from about 4000 B. C. o 1000 A. D. But this was never true aper. The first real paper was made n China about 1800 years ago.

"It is only within the last fifty years hat the world has begun to have nough paper. There never was nough until processes were developed or making paper out of wood instead f rags.

Consumption by Countries

"To show that we are now in a paper ge, such figures as we can obtain from ficial sources indicate that on the 1920 basis the per capita consumption of paper in Russia was 6 pounds. At the same date in Japan it was 12 pounds; in Germany, 45 pounds; Scandinavia, 33 pounds; Great Britain, 76 pounds; and in the United States, 150 pounds.

Fifty Pounds Per Person

"More specifically, in addition to being a paper age, we can say, I think, that we are in a newspaper age. In 1880 the per capita consumption of newsprint paper in the United States was three pounds. In 1893 it was nine pounds. By 1919 it had grown to thirty-five pounds, and in the year 1923 it was fifty pounds. In the forty-three years from 1880 to 1923 it has grown from three to fifty pounds.

Factors in Development

"There have been two great things that have led to this—making paper from wood and the development of the rotary printing press. The first newspaper in the United States was published April 24, 1704. It consisted of two sheets, 9 x 12 inches in size. The latest news it had was from London on the preceding December 2nd, and was about some kind of trouble in Ireland. Ireland has been a good source of news ever since. Today we have printing presses that in a single hour will turn out 48,000, 8-page papers, with each page nearly twice the size of the first paper. Today we have 22,000 newspapers in the United States—and some to spare. I won't say which ones are to spare. We have over 2000 English-language dailies and with a circulation of 31,000,000 of week-day issues and 21,000,000 of Sunday issues. The average size of the daily papers with over 100,000 circulation is 27 pages, with 100 pages for the Sunday issues. They contain all sorts of material.

What Constitutes News

"It takes a great deal to make a big newspaper today. The editor of one of these great journals not long ago gave a talk to a class in journalism at one of our prominent universities. He endeavored to set up his conception of what constituted news. One of his mathematical formulas ran like this:

> 1 bank clerk plus 1 wife plus 3 children equals zero from a news standpoint.
>
> 1 chorus girl plus 1 bank president minus $100,000 equals news.

Graphic Notes of Paper Consumption

"In 1923 the amount of newsprint paper used in the United States was 2,800,000 tons. If spread out into one continuous blanket it would cover an area equal to the combined areas of New Jersey, Massachusetts and Connecticut, something over 12,000,000 acres. It would also make a strip 400 feet wide running from here to the moon. You have seen coming down the streets of the city on heavy trucks great rolls of newsprint. These rolls are as a rule 72 inches wide. The newsprint paper used in the United States in 1923, if put into one of these rolls and unwound, would stretch 16,500,000 miles or reach to the sun in 5 years and 8 months. Some of you see the New York *Times*. On October 7th last year the *Times* used 877 tons of paper in printing that one Sunday issue. This much paper would blanket 3,800 acres.

"We have today paper machines that are turning out paper at the rate of over 1,000 feet a minute in a steady stream. We have newspaper presses eating it up even faster.

Growth of Advertising and Circulations

"Certain interesting developments have been responsible for this unprecedented use of newsprint. Advertising has been one of the big ones. Tremendous circulation have had a great deal to do with it. We have today papers that in twenty years have grown from 100,000 to 700,000 or 800,000 circulation. We have printed at this time a copy of a daily newspaper every day for every family in the United States and Canada. There is a daily newspaper habit.

Mexico as Compared with Newfoundland

"In 1923 Mexico produced 12,000 tons of newsprint. Mexico has one modern paper manufacturing plant. Newfoundland, which has a paper mill established by Lord Northcliffe in 1909, during the same period produced 64,000 tons; Canada produced 1,263,000 tons of newsprint and the United States 1,485,000 tons. So that during 1923 North America produced two-thirds of all the newsprint paper produced in the world. More than 88 percent of the

Canadian newsprint went to the newspaper publishers of the United States; 10 percent was used in Canada. The rest went to the ends of the world; 6.000 tons went to South Africa.

Newsprint is 100% Wood

"Newsprint is a 100 percent forest product. The highest grade of paper is made from rags. The next highest is made from woodpulp and rags. Newsprint is made entirely from wood. It consists of about 80 percent ground wood and 20 percent sulphite pulp. Sulphite is produced by cutting wood up in small chips and cooking it in a chemical solution for six or eight hours. The chemicals dissolve out everything except the pure cellulose. Groundwood is produced by holding bolts of wood against rapidly revolving grindstones. A little coloring is added usually to improve the appearance.

Increased Output of Newsprint

"For the past nineteen years there has been an average increase over the preceding year of 7 percent in the combined output of newsprint paper in the United States and Canada.

"Canada is watching her output grow with very great interest. It will be close to that of the United States by the end of 1924. The production of newsprint paper follows cheap wood and cheap power—the prime requisites. At the present time Canada is more fortunate in having these elements than the United States. The industry was developed earlier in the United States. Canada is not so far along in the exploitation stage.

"We have at the present time a producing capacity of 10,000 tons of newsprint a day in North America, an increase between 60 and 70 percent in the past six years.

Pages of Newspaper in a Cord of Wood

"The unit of supply of the raw material for making newsprint paper is the cord of wood. About 1½ cords of pulpwood is required for producing a ton of newsprint paper. Translated into more familiar language, it has been figured out that a cord of wood will furnish 96,000 pages of newspaper of the ordinary size. The great production of newsprint paper we had in 1923 in North America required about 4,000,000 cords of wood, a pretty good little wood pile.

Where Will We Get the Wood?

"Where are we going to get the wood? Not bery long ago I ran across a book written by a man in England in 1890 when woodpulp papermaking was just getting into a good stride. He spoke of being able to turn to wood as an inexhaustible source of supply for the future. That is obviously not true. There is no such a thing as an inexhausible supply. We can make such a thing true, but it is not yet. There are no exact statistics on this subject, but of the species of wood we are now using to make paper from, we are supposed to have in the Northeastern States about twenty-five years' supply of pulpwood at the rate it is now being used. In Eastern Canada at the present rate of consumption we have perhaps not more than fifty years' supply, nobody knows exactly.

Paper Mill Investment Figures

"The requirements for a completely self-sustained modern news mill are very much greater than the ordinary man realizes. I mean a plant equipped to make its own groundwood, its own sulphite, and then equipped to take the two and put them into sheet paper with all modern improvements and at the modern rate of production. Such a plant requires about $50,000 investment for every ton of daily capacity to make paper. A plant with a capacity of 100 tons daily on that basis means $5,000,000 of investment. That includes nothing for production of a supply of raw material. Coupled with this hypothetical plant there ought to be the ownership of sufficient producing forest to supply that plant with 40,000 to 45,000 cords of wood yearly. This might require an additional $5,000,000, making a $10,000,000 investment altogether, or an investment of $100,000 per ton for every ton of daily capacity.

Problem of Timber Cultivation

"Now you see something of the magnitude of the problem of manufacturing paper. We must take some thought as to the future of our raw materal.

Among the paper manufacturers in the United States and Canada and the newspaper publishers there is a more intelligent, a livelier interest in the problem of protection and reproduction of forest resources than there has ever been. It is exceedingly gratifying to note that big paper producing companies are figuring most seriously upon methods of putting their forest lands on a permanently producing basis. Most of the talk about getting paper out of a substitute for wood is beside the point. The thing to do is to keep the forest land of this country, producing the wood we need.

"Every one of us has a duty to perform in helping promote proper forestry measures. After all these years of education and agitation, we are settling down to a practical forest policy for the United States and Canada. Whenever you get a chance to help in that direction you are doing the best possible thing you can do."

* * *

Company Incorporated

The Commonwealth Wall Paper Company has been incorporated at Boston, Mass., and has been authorized to issue 100 shares of common stock without stated par value. The company will manufacture wall paper. The incorporators are Charles D. Golub, president; Samuel Blackman of 36 Cunningham Street, Samuel Brenner, clerk.

FITCHBURG RECEIVER FILES REPORT

Permanent Receiver to Be Named t Operate the Plant

GEORGE WEBSTER of Holyok Mass., temporary receiver in the cas of the Fitchburg Paper Company agains the Whitmore Manufacturing Company Holyoke under court decree, has filed hi report and orders of notice to creditors the Whitmore Company and to others interested were issued. It is probable tha a permanent receiver will be named at tha time. Mr. Webster, with the filing of th report, resigns as temporary receive Avery, Gaylord & Davenport are couns for the Whitmore Company.

Receiver Webster's report as to the co dition of the Whitmore Company follow

"Your temporary receiver respectful represents that he has been operating th Whitmore Manufacturing Company und decree of this court since Dec. 20, 192 the date of his appointment, a period substantially eight weeks. During th period he has sold and delivered pape products to the value of $42,858.31; tha he has on his books at this date uncom pleted orders for $10,078 for paper proc ucts; that there are no receiver's certif cates now outstanding; that there is noth ing due on account of the receiversh operation of this plant, except accoun payable of $3,239.72, accrued payroll $500, salaries of $230, mortgage interest $383.68; your temporary receiver has cas on hand of $427.66 and your temporary r ceiver says there is due him from the o eration of the plant of the Whitmo Manufacturing Company $28,618.35; th your temporary receiver has on hand paper products, raw, wrought and in pr cess, approximately $45,088.39; land, buil ings and machinery, equipment, furnitu and fixtures of a total book value of $270 150.90, said land, buildings and machiner being subject to a mortgage for $100,000 Holyoke Savings Bank of Holyoke.

"Your temporary receiver has spent f operation of the plant during the perio covered by this report, including he power, light, labor, salaries, wages, m terials, supplies, office expenses and cou sel, $40,128.60 which amount includes $15 110.86 received by him on accounts place on the books of the company prior to th receivership, which accounts had been a signed to the First Peoples' Trust of Bo ton and which accounts were ordered be paid by this court to the First People Trust; that he has received during th period $40,556.28 which amount includ the said $15,110.86 which he paid to th First Peoples' Trust of Boston in accor ance to the foregoing."

* * *

McCall In Dayton

Consumption of paper in Dayton will increased materially with the opening Apr 1, of the first unit of the McCall Publis ing Co. plant, being moved to this city fro New York.

Forty presses will be operated at th start, it was divulged by Nellis R. Fun mechanical superintendent, at a rece meeting of the Dayton Printing Hou Craftsmen's club.

Five hundred people will be employe Where the company plans to obtain magazine and pattern paper has not be announced, although it is known that th stock for both purposes could be obtaine in mills in this section.

Permeability vs. Porosity of Paper

Interesting Features of the Gurley Densometer Which Gives Satisfactory Results Under Varying Conditions

By C. F. HANSON

Director of Research, Habirshaw Electric Cable Co., Yonkers, N. Y.

IN the issue of PAPER for February 14, 1924, one page 14 was a paper by V. Ravizza on the "Degree of Porosity of Paper" which I have read with a great deal of interest. I desire to make one or two comments on this paper.

1. I note the term "porosity" is used in the title. I am wondering if air permeability would be more appropriate. This term is used by some paper men in England and by a few in America. I am not suggesting that the term "air permeability" be used instead of porosity, but am wondering which one would be the more desirable one to use for standardization work. If you have any comments on this matter, I should be pleased to receive them.

2. On page 15, in the first and second paragraphs appear criticisms regarding the type of instrument as represented by the Gurley densometer. The paragraphs state that air in contact with water in these instruments becomes laden with moisture which is carried to the paper under test and changes the porosity of the paper and thus introduces an error, and also that the effective hydrostatic head changes during the test. Regarding the moisture in the air changing the porosity of the paper, I have not found any serious effect of this in testing insulating paper with a density ranging from 5 to 50 seconds per 100 c. c. displacement of air through a circular opening of one square inch.

We have a Gurley densometer which we have been using for over a year. We have used kerosene in this instrument and found that the readings obtained with kerosene check very closely with those obtained with distilled water. Furthermore, after allowing the air to pass through the sample of paper once, we have permitted it to pass through a second time and the second reading checks with that obtained in the first. In view of this experience I would say, so far as insulating papers are concerned that the error introduced by moisture being carried by the air into the sample is negligible.

Regarding the change in hydrostatic head, the Gurley densometer has the least change in the head of the four instruments listed in the article. It is true that, using paper as nearly identical as possible and using the same aperature, the reading obtained on a Gurley densometer will not check with the reading obtained on a "suction paper porosity tester" as shown in Figure 4, because in the instrument as shown on Figure 4, the hydrostatic head changes considerably whereas with the Gurley densometer, the change is very slight. I might add also, that the question of friction in the Gurley densometer might be a factor affecting the results. In the study of this factor, I have used kerosene instead of water and also placed the instrument in different levels to see what the difference would be in the readings obtained. I found that the readings were the same with kerosene as with distilled water and that the level could be changed to a considerable amount before any appreciable change occurred in the readings obtained. I concluded that with just a fair amount of accuracy in leveling, the errors due to friction were entirely negligible. I found, however, that there is one interesting feature about the Gurley densometer and that is the readings obtained by using different size apertures.

One instrument we have has a circular aperture of one square inch area and the other one has a circular aperture of 0.25 square inch. Theoretically, it would be expected that the one with the smaller aperture would give a reading four times that of the larger aperture. However, in practice, I find that the ratio is more nearly 3.2. The only explanation that I can give for this is what I call an "edge" affect. In a smaller aperture, the periphery is much greater in relation to the area than it is in the case of the instrument with the larger aperture. It seems, therefore, that stretching near the edges of the paper would not be the same for the two different size apertures. The difference in the stretching might explain the deviation of the experimental ratio from the theoretical ratio.

Complains of Waste

First reports of the effect of paper mill waste on the Wisconsin river and on other streams of the state is contained in the 1923 bulletin of C. M. Baker, state sanitary engineer, just issued.

Although the survey, which was started last fall, has not gone far enough to permit conclusions, the work which has been done thus far is outlined in the report. The survey will be pushed to completion when the water is at a low stage during the summer months. It may result in rather drastic rules in regard to pollution of streams by waste from paper mills, it was said.

Samples of river water were collected above and below sources of pollution in the vicinity of Rhinelander, Tomahawk, Merrill, Wausau, Mosinee, Stevens Point and Wisconsin Rapids. Analyses of the water were made to determine the effect of the waste and the natural purification process.

In addition to the work to be done in the Wisconsin river and in other streams this summer, investigations also will be made at each of the mills to determine the volume and the character of the various wastes. The report of the sanitary board also describes outbreaks of typhoids at Wausau, Minocqua, Two Rivers and discusses the typhoid reduction at Sheboygan and Sturgeon Bay, subsequent to water improvements.

Try Out Plan

Grays Harbor County, Washington owners of cut-over lands will try out a reforestation plan originating with County Assessor J. E. Calder.

Grays Harbor County, one of the most heavily timbered counties in the state, has a continually enlarging area of logged off lands. Much of this land is worthless for agricultural purposes and hence after the timber has been felled the assessed value of the land is lower and the tax money received by the County for it is less than formerly paid into the treasury on the same land.

The owners have agreed to put their cut-over lands under the jurisdiction of the state forest patrol which has previously only guarded standing timber.

The Washington state law requires proper burning of slashings immediately after logging as a part of that operation. With proper protection the land will re-forest itself from the seeds not destroyed. Dean Hugo Winkenwerder of the College of Forestry of the University of Washington states that the vitality of the Douglas fir seeds last for seven years and that it is not injured by the heat of the ordinary slashing fires.

The actual cost in the past for fire patrol has amounted to approximately 3 cents an acre although the statuary allowance has been 5 cents for it.

Paper Men Play Basketball

Teams representing four plants of the Kimberly-Clark Paper Company will take part in a big basketball tournament Friday and Saturday, February 29 and March 1 in the new Kimberly clubhouse at Kimberly, Wis. The four teams will represent the company's plants at Niagara Falls, N. Y., Niagara, Wis., Kimberly, and Neenah. Contests on a par with those between professional teams are promised.

Each team representing the Kimberly-Clark Company is composed of men with professional experience or men who have starred in college and the rivalry between the company's mills is keen in all branches of athletics.

The Neenah aggregation has traveled through the state in years past and defeated some of the best professional teams. With such stars at Kenneth Chappelle, Ivo Anderson, Kuehl brothers, Creaven, Stilp and others the Neenah mill's quintet is expected to give a good account of itself. All the teams are evenly matched and the games will be keenly contested. The team that wins will be recognized as one of the best in the country.

The coming contests are arousing great interest in industrial and sporting circles and the management is making arrangements to take care of a large attendance as each of the mills' teams will be supported by a large body of rooters.

Some Sulphite Mill Calculations

A Collection of Formulas and Graphs Which Will Assist in Designing Apparatus or Calculating Results of Tests

Part II Gas Volumes

By W. B. VANARSDEL

NOTE.—*The writer of this series of articles does not aim to present a complete text of chemical engineering calculations, nor is any claim to originality put forward. The methods which are described are for the most part well known, but some of them have been described in books or magazines which are not always available to the pulp mill engineer. Many of the graphs, and one or two of the calculations, are new.*

(A) *Reduction of gas volumes to standard conditions of temperature and pressure.*

The volume of a perfect gas varies directly as the absolute temperature, and inversely as the absolute pressure. Then if v is the volume of a pound of the gas at one temperature, T, and pressure, p, and v_0 is the volume at another temperature, T_0, and pressure, p_0,

$$\frac{v}{v_0} = \frac{T}{T_0}\,\frac{p_0}{p}$$

If standard conditions are taken as a temperature of 32°F (491.6° absolute) and a pressure of 29.92 inches, this equation may be written,

$$\frac{v}{v_0} = 0.0608\,\frac{t+459.6}{p}$$

where t is temperature in degrees F.

Fig. 1 gives a graphical solution; thus any given weight of gas occupies 1.35 times as much volume at a temperature of 250°F. and a pressure of 32 inches, as it does at standard conditions.

(B) *Partial pressure and percentage by volume.*

When the percentage composition of gas is determined by means of the Orsat apparatus, the result is in percentage by volume on a dry basis. If the gas contains no moisture, and the percentage of a constituent A is determined,

$$\text{Partial pressure of A} = \text{Total pressure} \times \frac{\%\text{ by volume of A}}{100}$$

If the gas is wet, however,

$$\text{Part. press. of A} = \frac{\%\text{ by vol. of A}}{100} \times (\text{Total press.}-\text{pressure of water vapor}).$$

For the case in which the gas is saturated with water vapor, Fig. 3 will assist in the solution of this equation.

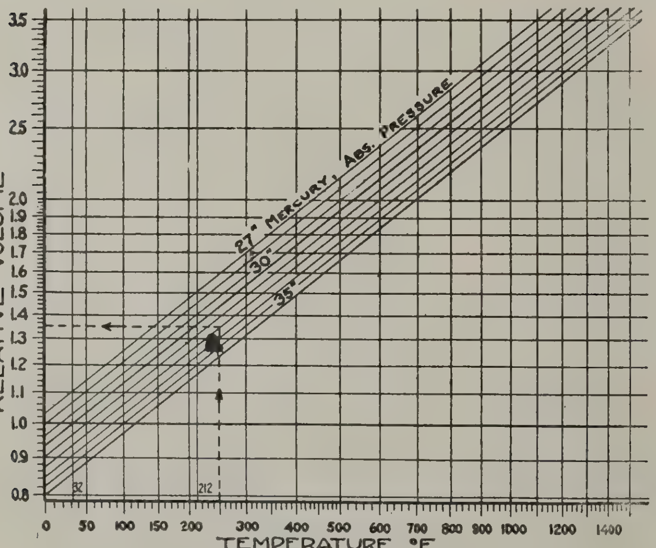

Fig. 1—Gas Volumes Relative to Volume at Standard Conditions

(C) *Percentage loss or removal of a constituent.* (1)

Suppose the percentage of sulfur dioxide (or any other gas) is determined both at the inlet and at the outlet of an absorbing system, the percentages being A and B respectively. Then the recovery, or percentage removed in the absorbing system,

$$\%\text{ removed} = \frac{10{,}000\,(A-B)}{A\,(100-B)}$$

while the percentage lost in exit gases,

$$\%\text{ loss} = 100\left[\frac{B\,(100-A)}{A\,(100-B)}\right]$$

Notice that if the percentages are 50% entering the system and 10% leaving it, the loss is not 1/5, or 20% of the sulfur dioxide, but only 1/9 or 11%. These equations hold true whether or not the gas has changed in temperature or pressure, or has picked up or lost water-vapor (assuming the Orsat method of analysis), but if another gas appears as the first one disappears (as for instance dioxide in a Jenssen system),

$$\text{substitute } \frac{100-C}{100-C} \text{ for } B,$$

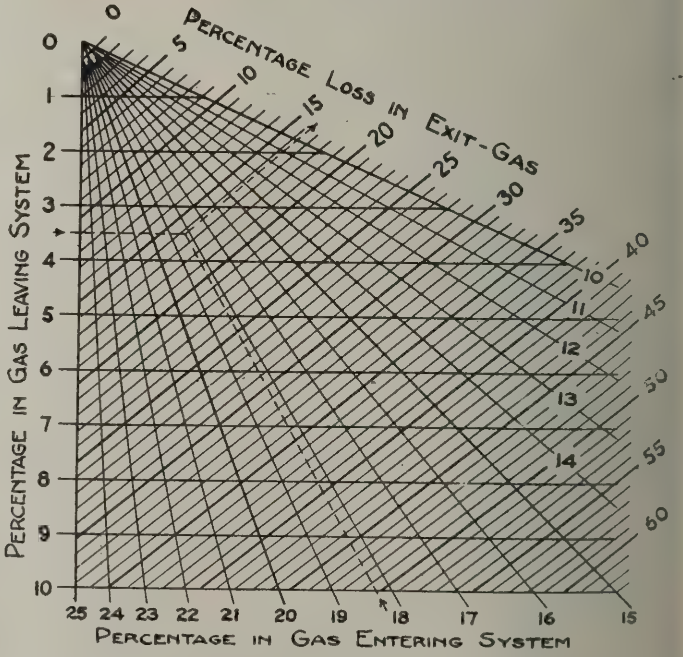

Fig. 2—Percentage Loss in Tail-Gas from an Absorption System

where C is the percentage of the second gas at the outlet. Fig. 2 is a graphical solution of the equation for percentage loss.

For example, if gas entering an absorption system contains 18.25% of sulfur dioxide, and the gas leaving the system contains 3.5%, 16.25% of the sulfur dioxide is lost in the tail gas.

(D) *Percentage by volume and percentage by weight.*

---

(1) W. B. VanArsdel, *Chem. Met. Eng. 24*, 846 (1921).

Suppose the analysis of a gas is given as *A, B, C* and *D* percentages by volume of four constituents, and the molecular weights of these constituents, are respectively *M, N, P* and *R;* then the percentages by weight will be:

$$\text{Of the first, } a, = \frac{100\,AM}{AM + BN + CP + DR}$$

$$\text{Of the second, } b = \frac{100\,BN}{AM + BN + CP + DR}$$

$$\text{Of the third, } c = \frac{100\,CP}{AM + BN + CP + DR}$$

$$\text{And of the fourth, } d = \frac{100\,DR}{AM + BN + CP + DR}$$

The molecular weights which are likely to be used in pulpmill work are as follows:

Oxygen,	32.0
Nitrogen,	28.0
Air,	28.8
Sulfur dioxide,	64.4 (approx.)
Carbon dioxide,	44.1 (approx.)
Chlorine,	71.0 (approx.)
Water vapor,	18.05

E) *Volume changes due to water vapor.*

At a given temperature, no more than a certain fixed weight of water will evaporate into a cubic foot of gas, nd this weight is independent of the composition or pressure of the gas. It is given in the lower curve and right-and scale of Fig. 3.

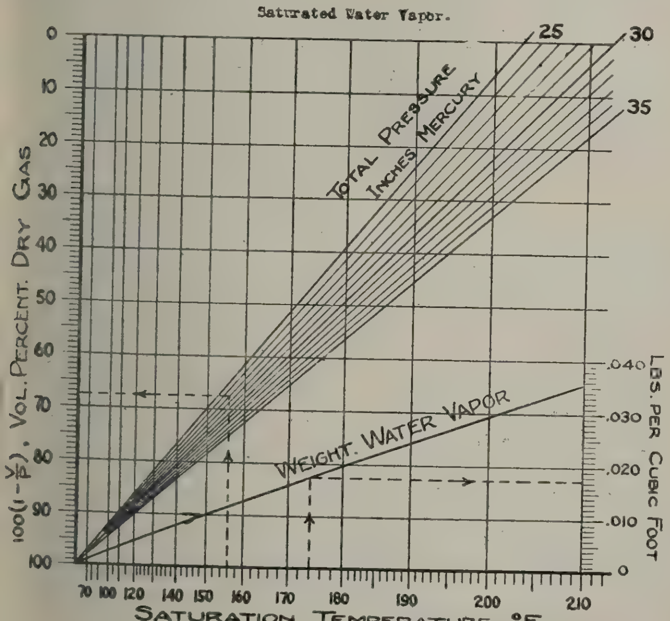

Fig. 3—Volume and Weight of Saturated Water Vapor

hus at 174°F, 0.0174 pound of water vapor "saturates" cubic foot.

If *P* is the total pressure in a moist gas, and *V* is the por pressure of water at that temperature, then if the s is saturated with water vapor,

$$\text{Percentage of dry gas, by vol.} = 100\left(1 - \frac{V}{P}\right)$$

is quantity is given by the upper lines and left-hand ale of Fig. 3. A gas at 27 inches total pressure, saturated th water vapor at 156°F, contained 67.5% by volume of y gas. Then if a cubic foot of dry gas is saturated with water without changing in temperature or pressure, its volume increases:

$$\frac{\text{Wet volume}}{\text{Dry volume}} = \frac{1}{1 - \dfrac{V}{P}}$$

If *A* is the percentage by volume of a constituent on a dry basis, its percentage on a wet, or saturated basis decreases:

$$\%\text{ in wet gas} = A\left(1 - \frac{V}{P}\right)$$

The partial pressure of this constituent (see section B above), in the wet gas becomes:

$$\text{Partial pressure} = \frac{AP}{100}\left(1 - \frac{V}{P}\right)$$

(F) *Specific volume of sulfur dioxide.*

Within the ordinary operating range of temperatures and pressures, sulfur dioxide does not exactly follow the simple gas law quoted in the first sentence of Section A; the deviations amount to several per cent at fairly low temperatures and high pressures. Several experimenters have measured the actual density under various conditions. Fig. 4 is a summary of the results of Roth, Regnault and Baume, expressed as cubic feet per pound. The reference point, 32°F, 760 millimeters pressure, corresponds to a volume of 5.475 cubic feet per pound.

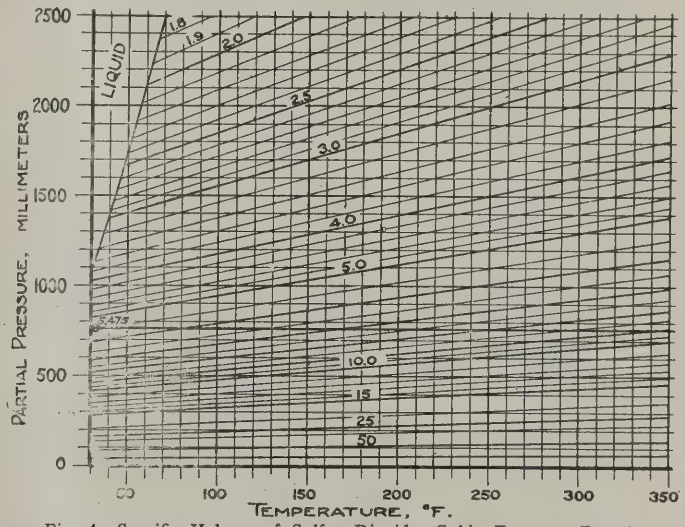

Fig. 4—Specific Volume of Sulfur Dioxide, Cubic Feet per Pound

Example. 325 cubic feet per minute of a dry gas containing 18% SO_2 enters an absorbing system at a temperature of 90°F. and a pressure of 6 inches of water. Barometer 28.8 inches, or 732 millimeters. The gas leaving the system tests 1.5% SO_2 by Orsat analysis, is at atmospheric pressure, and is saturated with water vapor at a temperature of 68°F. (a.) What is the volume of gas leaving the system? (b.) What weight of water-vapor does it carry? (c.) What weight of SO_2 enters the system per minute? (d.) What percentage of this SO_2 leaves with the exit gases? (e.) What weight of SO_2 is thus lost?

6 inches of water = 0.44 inches of mercury = 11 mm. of mercury; total pressure = 29.24 inches or 743 millimeters at inlet, 28.80 inches at outlet.

(a.) Volume of inert gas mixed with the SO_2 = 0.82 x 325 = 266.5 cu. ft. Using Fig. 1, the volume at 90°, 29.24 inches is 1.135 relative to standard, and the volume at 68°, 28.8 inches is 1.110. Then the volume of inert

$$\text{gas leaving the system} = 266.5 \times \frac{1.110}{1.135} = 261 \text{ cu. ft.}$$

Get Busy

Unless the American paper industry wants to be smothered beneath the constantly increasing river of imports from Europe, it is time to get busy. For the foreign competition is, without a doubt, what is placing the paper industry in this country in its deplorable condition.

The American Paper & Pulp Association has acted with commendable promptness in assigning that double-barreled hustler, Warren B. Bullock to the task exclusively of going to the bottom of the business and finding a solution. While it is a tremendous contract, Mr. Bullock can do it.

PAPER wants to offer itself unreservedly to Mr. Bullock in this campaign to defend the American paper industry. The first public announcement that the paper industry means business was made in an article in last week's PAPER in which Mr. Bullock summarized the entire import and export situation, pointing out some of the subterfuges used to get goods into this country. PAPER is wholly in accord with this campaign. It will do whatever it can, for it has for weeks been pointing out the danger of that competition.

When Mr. E. J. Dougherty, head of the Anti-Dumping Unit, said that the chief blame for lack of action lies on the men in the paper industry themselves, he appears to be speaking the truth. No other industry will worry about the American paper trade. Then the American paper trade must take the bull by the horns and do things for itself. Evidence is required in such cases, as in all legal proceedings before action can be taken. It is up to the men in the paper industry to gather that evidence, and to properly present it.

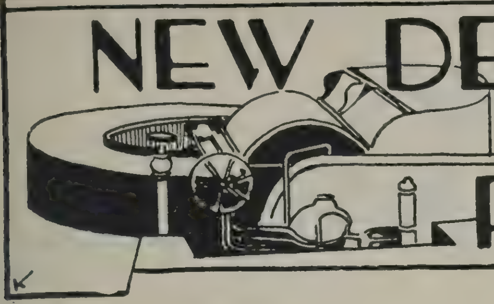
The solution of the import problem may not be easy to find. It is no idle, small, trifling problem. It is a gigantic thing with malicious teeth and disposition. When imports gain fifty per cent in one year, over the preceding year, and exports remain practically stationary, it is high time to act.

Full support should be forthcoming for Mr. Bullock in this campaign. He is deserving of and should get without exception the entire support of the industry.

The time for idleness and rumination has passed. It is time to get busy. Action is the only thing European competitors will listen to.

It is true that speaking in general the drift of our current trade accounts with the rest of the world approaches more nearly to a balance than at any time since the year 1910. The figures on foreign trade of the year 1923, just published by the Department of Commerce, reveal that we exported $376,000,000 more of goods than we imported. The balance in our favor attains but a tenth of that in 1919, an eighth of that in 1918, a ninth of that in 1917. It only slightly passes half of the balance of 1913, a year of peace in the chief countries later engaged in the European war.

But these facts do not help the paper industry one iota. The harrowing facts have been given and they show conditions in a bad light.



NEW DEVELOPMENTS IN PAPERMAKING

Method of Preserving and Hardening Paper

A method of preserving and hardening paper is the subject of a patent issued to Judson A. De Cew, of Mount Vernon, N. Y., under date of February 12, 1924, the U. S. patent number being 1,483,630. Mr. De Cew has assigned the patent to Process Engineers Incorporated, of New York, of which he is president.

As set forth in the patent specifications the invention consists essentially in coagulating the soluble mucilaginous or colloidal matters in the paper pulp with an agent which is at the same time a preservative.

Mr. De Cew says he has discovered a method of improving the quality of the paper which consists in preserving the pulp from fermentation during the process of manufacture and at the same time coagulating the soluble mucilaginous matters present by either accident or design within the pulp.

Paper pulp is in general not sterilized in the process of manufacture and as a result, jell-like masses form wherever the pulp lodges in pipes or tanks, and when they dislodge, masses of slime cause serious difficulties with the paper machine besides producing many blemishes in the paper.

In most pulp stock there is soluble mucilaginous material which is especially apparent in mills using waste paper.

A solution of formaldehyde used in small quantities will not only prevent fermentation in the pulp but will coagulate most of the soluble mucilaginous material present and increase the retention of it in the paper. The result of this treatment is a harder and snappier paper and there is less difficulty on the paper machine.

In applying this process, Mr. De Cew adds to the beater or mixing tank, a solution of formaldehyde in the proportion of approximately one pound formaldehyde to one thousand pounds of paper stock. The stock so treated improves with age instead of undergoing the usual deterioration.

Waste paper stock is often coated with glue or casein or starchy materials which is not coagulated will cause froth to form on the paper machine which slows down production. Where this process is used, much cleaner paper can be made because the pulp does not stick to the pipes and tanks. When paper stock is acid with the alum used in sizing it, it is much more likely to ferment than at other times and under such conditions, this process is very important also.

What Mr. De Cew claims as his invention is:

1. A method of preserving and hardening paper which consists in adding to the pulp a solution of formaldehyde and completely mixing it with the pulp before passing the pulp to the paper machine.
2. A method of preserving and hardening paper which consists in treating the paper pulp with a solution of formaldehyde in the proportions of approximately one pound of formaldehyde to one thousand pounds of pulp.
3. A method of preserving paper pulp containing alum from fermentation which consists in incorporating into the mixture of pulp and water a small quantity of formaldehyde solution.
4. A method of preserving and hardening paper which consists in coagulating the soluble mucilaginous matters in the pulp with a coagulating agent which is at the same time a preservative.

Sizing of Paper with Tree Bark Oil Soap

Tree bark oil is a dark green mass of fat and resin extracted from the bark in the course of its preparation as a fodder material. It melts at a temperature of 35 degrees C and in the crude state requires for saponification 5.70 per cent of sodium carbonate. The soap is prepared by heating with the necessary quantity of soda ash for several hours or more rapidly with caustic soda, the product from one thousand grams of the oil being made up to 150 grams. This soap, in the proportion of six per cent of doap and four per cent of sulphate of alumina, has been used successfully for the sizing of paper pulp. Larger quantities give a larger paper and the pulp tends to be sticky from excess of resinous matter.

A peculiarity of the papers that are sized with bark oil soap is the fact that the ink resistance of the sized paper increases with age, so that a marked improvement is noted after two months and a very marked difference exists after a few years. This is attributed to the progressive oxidation of the unsaponifiable matter in the size emulsion. Bark oil soap is not so powerful a sizing agent as cottonseed oil soap, but whereas the latter produces a very marked dimunition in the tensile strength of the paper, as is the case with the aluminum soaps of all the fatty acids, the decrease is far less in the case of the bark oil sizing, presumably on account of the resinous constituents of the latter. *Journal of the Society of Chemical Industry.*

Preventing the Reddening of Sulphite Cellulose

Dr. Emil Heuser has been granted a patent, see German Patent No. 388,213, on a process of continuously preventing the reddening of sulphite pulp.

It has been shown that the reddening of sulphite pulp during the course of the treatment of the pulp in the beater can be permanently prevented by the addition of a very dilute acid solution of the persulphates of the alkalies or the alkaline earth elements. The process may be applied in the following manner.

Four kilograms of difficultly bleachable sulphite cellulose (the chloride of lime required to bleach the cellulose completely amounts to 19.8 per cent) and one thousand kilograms of water are very intimately mixed together in a beater. Then two kilograms of potassium persulphate, which amounts to one half a per cent on the weight of the air-dry pulp, and two kilograms of aluminum sulphate are added and thoroughly mixed with the pulp. The whole mass is then transferred to a tank provided with stirring arrangement and mixed therein for such time as is required for the conversion of the reddish coloration of the sulphite pulp to a light gray. This process takes about nine hours. At the end of this time all of the persulphate has been consumed.

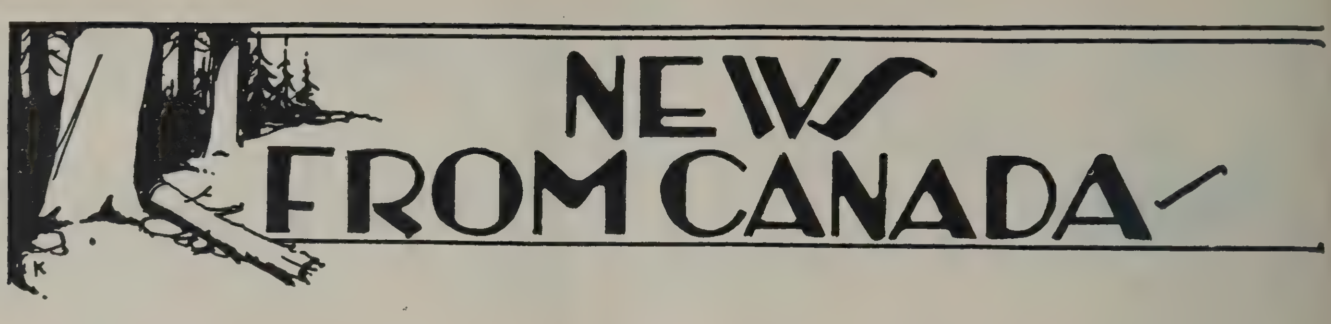
* * *

Preparation of Paper Stock

Cellulose fibers which are suitable for use in the manufacture of paper may be isolated from cellulose-containing materials; such as wood, flax straw, bran and other similar materials, by digestion, preferably with continuous circulation of the digestion liquor, at a high temperature and pressure with liquids that have the least possible carbonizing effect on the fibers, such as, for example solutions of ammonia, sodium carbonate, hydrogen sulphide, or the like.

The digestion proceeds more rapidly in the presence of catalysts, such as copper, nickel or iron, and is therefore preferably carried out in vessels which are made of such metals. This process may be used for the preliminary treatment of, and partial removal of lignin from, cellulosic material previous to digestion by known processes, such as the sulphite or the soda process. Or it may be used in conjunction with them, mixtures of ammonium hydroxide with other cooking liquors being employed.

For example five hundred kilograms of wood are effectively opened up by heating the mass to a temperature of 280 dgrees C for a period of ten minutes with three hundred liters of a two per cent solution of ammonium hydroxide solution in an iron boiler, preferably of the vertical type, prorided with suitable circulating pump.



NEW FACTS BROUGHT OUT IN PULPWOOD HEARINGS

Laurentide Engineer Testifies on Forest Resources of Quebec—Sweazy Favors a Compromise

AT the sitting of the Canadian Pulpwood Commission in Quebec City, important testimony was given by Secretary Beck of the Canadian Pulp and Paper Association and by J. Wilson, forestry engineer of the Laurentide Paper Company, who testified in his capacity as a forestry engineer, rather than as an official of that company.

Mr. Beck said that he had sent out a questionnaire to all members of the Association for the purpose of finding out what percentage of their pulpwood they purchased from settlers and the prices paid therefor. The replies showed that practically all manufacturers said they bought as much wood as possible from private dealers. It was also shown that as a general rule they paid the ordinary export price, and, in some cases, rather more. The Laurentide Company said that although it owned extensive limits, 35 per cent of its annual consumption was obtained from settlers. Price Bros. said that they had bought quite a lot of wood from settlers, and that in future they would take all that was offered to them as long as the price was not prohibitive. Federal statistics were quoted showing that 30 per cent of the wood used in Canadian pulp and paper mills was obtained from settlers. He made light of the claim that the American mills would be able to get wood from Scandinavian countries in the event of an embargo being put on. He has spent much time in these countries three years ago, and had found manufacturers quite anxious about future supplies for themselves.

Mr. Wilson gave some interesting figures on the forest resources of Quebec showing that in 1913 the timber available was 363,603,000 cords. During the last 10 years, 14,000,000 cords had been burned, 72,000,000 cords destroyed by bud worms and 16,500,000 feet cut, making a total of 102,504,608 cords destroyed. This left available 261,098,592 cords. The yearly cut averaged 10,460,000 cords, and, assuming that there was no increase in the demand, the forests in the province, at the present rate of demand, would be gone within 26 years. He thought that the embargo would be beneficial.

At the Montreal sitting of the Canadian Pulpwood Commission R. O. Sweazy, of that city, a consulting engineer, and a man who knows the Canadian pulp and paper situation thoroughly, said when questioned about the proposed embargo on pulpwood exports: "I would favor a compromise between Canada and the United States by which Canada would be permitted to sell to the Americans all the pulpwood they need, provided that Canadian forest products from stump to highest grade paper are permitted to enter the United States duty free." He did not fear Scandinavian competition in the American market, if an embargo were declared. He also thought that the existing forest protection policy in Canada was pretty much a joke, and that, if continued, the wood supply would not last more than 30 years. However, once forest fires were checked he thought that the export of pulpwood would cease to be a grave matter. Nature provided for reforestation but Nature was helpless in the face of puny fire protection.

That a strong effort will be made to secure a compromise on the pulpwood embargo question through the free admission of Canadian paper of all kinds to the United States is also evident from the remarks of other leaders in Canadian pulp and paper industry.

H. F. Bullard, general manager of the Dryden Paper Co., recently said: "The machinery in our mill is largely of American manufacture. On all such importations duty and sales tax has brought up the cost to us to 35 per cent above the price paid for similar machines by our United States competitors. Where articles produced in Canada are available, the effect of the tariff has brought the price up to practically the same as the U. S. price plus duty. The Canadian mill, therefore, starts with a heavy handicap as compared with its United States competitor in the greatly increased capital on which interest has to be paid. The United States mill also has the advantage in greatly reduced prices for coal, chemicals, machine, clothing, repairs and general supplies.

"It would, therefore, seem reasonable to reserve for Canadian industry the one commodity (pulpwood) by means of which the Canadian manufacturer can overcome the handicap of higher costs which the tariff and distances from sources of supply impose in his operations. If the United States mill, however, is allowed to continue competing against the Canadian mill in the purchase of pulpwood, we feel that some compensating advantage should be accorded to the Canadian mill and representations should be made to the United States government for the free entry into that country of all grades of paper produced, in addition to newsprint on which no duty is now imposed.

"In conclusion, therefore, we believe that if it is impossible or unwise for the Canadian government to put into effect an embargo on pulpwood from privately owned lands, that strong representations should be made to the United States government to remove either wholly, or in part, the tariff barrier now existing in order that Canadian industry may be placed in a position to compete with mills across the international border who are using Canadian wood."

Star New Operations

John Martin, head of the John Martin Paper Company, Winnipeg, and a partner in the Buntin Reid Paper Company, Toronto, was in Toronto last week and stated that by July the company would be operating in their new building in Winnipeg. The new structure is being erected on the site of the old building which was recently destroyed by fire, the John Martin Paper Company having been completely burnt out.

MAJORITY TESTIFY AGAINST EMBARGO

British Columbia Depends on U. S. to Supply the Market

WHEN the royal commission on pulpwood held sessions in Vancouver recently a majority of witnesses, contrary to expectations, testified against application of an embargo on the exportation of logs from the province.

British Columbia, with her great stands of virgin timber, depends largely upon export demands of the United States and the Orient to keep her log market up to strength. United States capital plays a prominent part in logging operations of the province. Many witnesses before the commission were representatives of United States companies.

So marked was the absence of supporters of the embargo on the first day of hearings that the chairman, W. A. Anstie was moved to remark: "We should like to hear somebody in favor of an embargo on the export of logs. We understood that there was quite a strong sentiment in British Columbia that way but so far we have had no evidence of it."

All the evidences of the first day was against an embargo and, with one exception, came from the organized lumber industry. The exception was a farmer who said that he was cutting cottonwood on his land for which there was no market in the province but which found sale in Washington for manufacture into paper. An embargo would make his cost of clearing greater.

J. D. McCormick, president of the B. C. Lumber & Shingle Association, stated that the export market offered an opportunity to dispose of the smaller fir logs which mills were unwilling to handle, since their equipment was set to handle the larger logs. The small trees could not be left standing since their roots were so close to the surface that with the removal of the large trees they would soon blow down. He did not think that an embargo would bring United States mills to B. C.

Other witnesses testified that Japan would not be influenced to place capital in B. C. for manufacturing if her supply of logs were cut off by an embargo but would simply turn her business to United States Pacific operators.

The second and concluding day in Vancouver brought testimony from the other camp. Representatives of box manufacturers and a number of shingle men, led by Aird Flavelle, presented strongly-worded briefs urging the necessity of an embargo and conservation.

The box manufacturers pointed out that the United States and Japan received most of the spruce and hemlock exported in the form of logs, and, they said, much that went to the United States afterwards found its way to Japan where it was manufactured into shooks which competed with the products of B. C. box factories in the markets of the world. Figures were submitted to show that the export of these logs had increased steadily from 3,300,000 feet in 1920 to 45,000,000 feet in 1923.

Mr. Flavelle stated that prohibition of export from crown granted and crown lands should be effected.

* * *

Merging Talk Still Going

Negotiations, which are now well advanced, have been under way for some time looking towards the merging of several Canadian companies producing fine papers. It is understood that definite terms are now being discussed. The plan calls for the organization of a large new company backed by American and Canadian capital, the leading plants to be taken over being the Howard Smith Paper Mills, Limited, of Montreal, and the Provincial Paper Mills, Limited, of Toronto. Others may be included. While no suggestion has been made as to possible capitalization, it is understood that some fairly extensive financing would be undertaken. Whether this will take the form of a stock or bond issue is not clear. The get-together movement on the part of these interests may be hastened by the realization that the home market cannot absorb all the fine paper they produce, while it is difficult just now to find new markets abroad.

* * *

Eddy Close Sulphite Plant

For the first time in thirty-six years the E. B. Eddy Co. of Hull, Que., has been compelled to close down its big sulphite plant, thus throwing out of work 220 men. This has been rendered necessary, not through lack of work, but because of the decision to install new and greatly improved machinery. It had been thought that possibly the closing down might not take place until summer, but it was finally decided not to put off the matter. It is probable that the period of idleness will last from five to six months. President Milne says: "We regret to have to close down the sulphite plant and thus cause possible hardship to a number of our employees, but some of the digesters and other machines have been in use there for 36 years and have outlived their usefulness. It is impossible for the Eddy Company to manufacture sulphite today as cheaply as we can buy it, for the old plant has become antiquated with the great improvements that have taken place within recent years. We have therefore been forced to decide upon scrapping the old plant and replacing it with an entirely new one."

* * *

Confidence In Saguenay

At the recent annual meeting of the shareholders of the Saguenay Pulp and Power Co. Senator Beique, chairman, informed the gathering that he had great confidence in the equity which the company holds in its various properties, especially the Peribonka limits. He regretted, however, to say that he did not consider their prospects very bright unless they could provide the capital necessary to meet outstanding obligations and supply working capital. He explained the difficulties occasioned through the Becker failure, which would mean serious losses, and also pointed out that large gains would result through changes made in contracts held by the company.

* * *

Speaks at Peterboro

C. Howard Smith, head of the Howard Smith Paper Company, and president of the Canadian Manufacturers Association, addressed a meeting of the Chamber of Commerce at Peterboro, Ont., on trade conditions in Canada, setting forth that high tariff means prosperity, and using the case of the United States as an example.

TO REOPEN BEAR RIVER PAPER MILL

Big Plant Was Idle For Three Years—New Financing Makes Reopening Possible

PREPARATIONS are being made for the reopening of the paper mill at Bear River. This mill will be operated by the Bear River Pulp and Paper Company. New York City, Boston, and Ohio parties have been instrumental in organizing the company. The chief difficulty experienced by the promoters and one that could not be overcome until the negotiations has consumed over eight months, was the appeasing of the bond holders in Clarke Brothers Limited, who had operated the mill for some years. The Clarke concern went into liquidation following the post war slump. Despite all efforts to revive the company, the plant remained idle for three years.

Recognition of their holdings at face value and the exchange in stock and bonds of the new company were finally agreed. It was decided that a flotation of approximately $200,000 in bonds would be made in order to renovate and re-equip the plant. This work has been started and indications are that the mill will resume operations in the late spring. It is also the intention of the leaders in the new company to build an extension to the mill and also construct wharves and warehouses besides maintaining extensive woods operations. The assets of the defunct company were offered at auction by order of the courts and bid in by the new company. It is unlikely that stock or bonds in the new company will be offered publicly for sale, for the present at least as the financing will be effected privately. Representing the company at Bear River now is C. W. Rantoul, who recently came from New York to undertake the work of preparing the plant for the resumption of operations.

* * *

Braun To Remain

Despite reports to the contrary, W. L. Braun, works manager of the Nashwaak Pulp and Paper Company, at the St. John, N. B., mill, of that concern, will remain in charge there. Mr. Braun has been stationed at the mill for the past two years. Previous to entering the employ of the Nashwaak Pulp and Paper Company he was employed by Brown Brothers Company at Berlin, N. H., and Fraser Companies at Edmunston, N. B. Joseph Allison, who was instrumental in part in the founding of the mill by the Cushing interests many years ago died recently. He was a director of the original company for some years. He was a leading mercantile figure in St. John, where burial took place. Two sons survive.

* * *

I. P. Increases Output

The International Paper Co. recently increased the output of its newsprint mill at Three Rivers, Que., from 240 to 310 tons daily. A further increase is expected to be made very soon. The shutting down of the Watertown plants has no doubt made stronger demands on the Three Rivers plant, which is operated at low cost.

* * *

Abitibi Makes Record

The Abitibi Power & Paper Co. has recently made some high records. The daily average for the week ending February 17th was 492.14 tons, an increase of about .16 tons per day. To do that at any time would be worth while, but to do it during two consecutive weeks is outstanding. In the same week there were three days when the production went over 500 tons. Tuesday, 503.72; Thursday, 501 50; and Friday, 506.72 tons. On Thursday and Friday the output was 1,008.2 tons. The week before there was only one day over 500 tons, February 7th, when the output was 512.82.

H. E. BEEDY TAKES DESK IN NEW YORK

General Manager of Nashwaak Pulp and Paper Company to Take Trip Abroad

IN the future, H. E. Beedy, who has been vice president and general manager of the Nashwaak Pulp and Paper Company, operating a mill at St. John, N. B., and owning large tracts of pulpwood lands in eastern Canada, will be stationed in New York City. Besides continuing in his present duties he will act as assistant general manager of the Oxford Paper Company, of New York City, operating a mill at Rumford Falls, Me. Mr. Beedy has been stationed at the St. John mill for the past two years, having succeeded E. N. Jones as general manager of the Nashwaak Pulp and Paper Company, a subsidiary connection of the Oxford Paper Company.

But before taking up his office in New York City, Mr. Beedy will make a tour of Europe in the course of which he will investigate pulp and paper manufacturing operations in Germany, Sweden, Norway, Finland and England. His tour will likely consume two months. Prior to leaving St. John, Mr. Beedy was presented a loving cup and silver cigarette case by the employes. While he will be stationed in New York City in the future, he will make occasional inspection trips to the Canadian and Maine holdings of the two companies.

The Nashwaak Pulp and Paper Company has increased the capacity of the St. John pulp mill ten tons of pulp daily. Heretofore the daily capacity was seventy tons. In the future it will be eighty tons daily. This increase was made possible by the building of a new dryer. This dryer was rushed along in construction. This is the second increase in capacity in a year. The first was achieved by the building of an addition to the plant and the installation of additional equipment, coupled with the building of a water main to connect with an increased water supply. A new main had been constructed by the city of St. John, from Spruce Lake, seven miles to the west. The Nashwaak Pulp and Paper Company then built a connecting main, about five hundred yards in length from the mill to the chief main. The increased water supply was a great boon to the company, as the lack of water in the past had been one of the principal operating defects.

* * *

Aeroplane Spies Out Land

American interests that have invested heavily in Canadian pulpwood limits have demonstrated the value of the aeroplane as a means of spying out the land. The experience of the *Chicago Tribune* interests supply a case in point. Last year they acquired from the Quebec government 2,000 square miles of limits on the Manichouagan district in that province and acquired also important water rights on the Outarde River. The latter is a rapidly running stream emptying into the St. Lawrence, there being in one part a drop of 200 feet within a few miles, making the current too swift for boats. Dense forests and heavy underbrush also make it difficult for surveyors to work on the ground. But the ground had to be surveyed, so recourse was made to the aeroplane. By observations thus made from a considerable height it was possible to gain information and solve problems that would have defied surveyors working by the ordinary methods. Moreover, the heavy power plant machinery can now be floated to the spot where it is desired to put it in place.

* * *

May—How smoothly the auto runs.

Ray—Yes, what do you suppose is wrong with it.

Fair Rent Question

One of the reasons for the call for a fair rent court in St. John, N. B., is said to have been the hefty advances in rents made by John A. Sinclair, chairman of the New Brunswick Workman's Compensation Board. Mr. Sinclair owns real estate in St. John. He is also head of the body that has been discriminating so strongly against the pulp and paper industry, and incidentally, posing as a friend of the "downtrodden." The compensation taxes demanded by this board are higher than any other board in existence. And yet not more than fifty per cent of the receipts from the taxes is allotted to the compensated. The balance is expended in "expenses". Now that the employers are exhibiting interest in the board, indications are that some changes will be made. What is needed is an entirely new organization. Because of incompetency over which they have no control, the pulp and paper companies are being heavily penalized. Investigation of the board by an efficiency expert has been under way.

* * *

Shipments Diminish

In proportion as the probability of an embargo on exports of pulpwood becomes more unlikely, to that extent do such exports from Canada decline, is the inference from the Canadian trade returns for January, which show the shipments of pulpwood to the United States last month to have been only 79,405 cords, as compared with 133,328 for the same month in 1923. During the 12 months ending January 1,330,406 cords of pulpwood were shipped across the line, or 252,000 more than during the same months during the preceding year.

Of the 1,874,167 cwts. of newsprint exported during January, all but 11,216 went to the United States. New Zealand took 8.139 cwts. and British South Africa 1,054 cwts. Australia did not take any, which shows that the British Preference, in which Canadian papermakers do not participate, is hitting the industry in this country very hard. In December, 1922, Australia took 42,000 cwts. of newsprint.

The total value of pulp and paper exports for January was $7,821,000, an increase of about $17,000 over December. Of this the United States took $7,283,000, and the United Kingdom $188,503.

Butterfield Dies

Samuel W. Butterfield, associated with the International Paper & Pulp Company, of New York and who designed and supervised the construction of many of the mills of the company, died Feb. 21 at his home, 69 Morrison Avenue, West Somerville, Mass.

He was a native of Farmington, Me., and was born Oct. 4, 1834. He became associated with the International interests many years ago and designed and supervised construction of their mills in Maine and Canada.

He was a member of various Masonic bodies. He is survived by a daughter, Miss Stella M. Butterfield of Somerville and a son, Fred Butterfield of Dover, Me.

* * *

Operating 80 Per Cent

The Kinleith Paper Mills, Liimted, whose head office is at St. Catherines, held their annual meeting a few days ago. The plant, which turns out about twenty tons daily of book and writing paper, is operating at about eighty percent capacity at the present time. H. F. E. Kent of Toronto, was re-elected President and General Manager; H. H. Love, Vice President; George H. Jefferson, Secretary and A. G. Parker, Treasurer.

RECEIVERSHIP WILL BE ENDED

Offer Assets For Sale to Close Out The Receivership

THE affairs of the Bay Sulphite Company of Canada will be wound up. At a recent meeting of bondholders it was decided to offer the assets for sale and tenders are being called for March 21st. The properties offered include the sulphite pulp mill at Port Alfred and the Chandler mill, which was taken over from the Saguenay Pulp & Power Co., as well as the timber limits. Such action is taken to establish the position of the bondholders as much as anything else. If the amount received does not cover the obligation to the bondholders, the latter will be empowered to take over the properties. The Chandler mill is at present closed down, but the one at Port Alfred is operating.

The Brown Corporation, which is one of the largest producers of sulphate paper in Canada, and a large manufacturer of bleached sulphite fiber pulp and kraft wrapping paper in the United States, is making an issue of $2,000,000 of 7 per cent cumulative preferred shares. The plants of this firm in Canada are at LaTuque, Que. The Brown Company of Portland, Maine, agrees that in the event of the Brown Corporation failing to pay any quarterly preferred dividend within one year of the required dividend date, or if the latter fails to make the required provision for sinking fund purposes, it will purchase any stock offered at 105 and accrued interest, U. S. funds.

The statement of the Saguenay Pulp and Paper Co. for 1922, just issued, shows that the gross operating income and sales were $6,646,750, as compared with $5,882,137 in the preceding year. After deducting selling expenses, cost of sales and general expenses gross income was $1,477,390 as compared with $2,433,073, the decrease being attributed to the increased cost of making sales. After making deductions for interest charges, for reserves and bad debts, a debit balance of $419,881 was carried to surplus as compared with a credit of $64,981 in the preceding year. The liquid position of the company at October 1st, 1923, showed an excess of current liabilities of $38,555 over current assets, as compared with a net working capital of $378,300 at the end of 1922.

* * *

The Embargo Again

The only commercial organization to endorse the proposed embargo on pulpwood exportation to the United States from Canada is the Chatham N. B., Board of Trade. This body held a meeting recently at which the embargo was the topic of discussion. A resolution was passed that the organization approved of the attempts to secure an embargo, and pledged itself to fight for such a measure, asserting it would conserve Canada's pulpwood supply and force the manufacture of pulp in Canada, as well. When the pulpwood commission convened in Chatham recently, the preponderance of sentiment as expressed on the witness stand was against the embargo.

In its meetings through Quebec, the pulpwood commission, now divided into two sections, one for the western provinces and the other for the east, has found the testimony strongly against the embargo. In many of the places in which hearings have been held, not more than five per cent of the witnesses have been in favor of the embargo. In a number of centers, no witness has appeared to favor the embargo. Very few of the farmers have espoused the embargo cause. Petitions have been submitted, signed by from fifty to five hundred farmers threatening to quit the farms if the embargo is introduced.

Canadian Mills Dominate

A. L. Perkins, of Powassan, Ont., who is a large dealer in pulpwood, says that he is opposed to the proposed embargo on pulpwood for several reasons. He states that the Canadian mills are rapidly dominating the continent in pulp and paper and are today side-stepping the freight rates in existance, to get their wood to the mills and are employing water transportation. Mr. Perkins adds that as long as provincial governments persist in setting aside vast pulpwood areas for the benefit of a few shareholders of large paper concerns, just so long will the Canadian public be obliged to contribute to railway deficits. There is a tremendous tonnage escaping the railways daily by the course which has been followed by provincial governments. "Put the embargo into effect," declares Mr. Perkins, "and you will curtail the earnings of the railways by many millions and completely stagnate the pulpwood industry, with serious consequences. The poplar pulpwood business in Ontario has reached immense proportions and ninety-eight per cent of this wood must be exported, as there is no market in Canada that we can find, in a shipping experience of twenty-nine years standing. I sincerely regret that the American market affords our only outlet that is profitable for peeled spruce and balsam and peeled poplar and their figure is none too high, considering prices of all commodities that go to produce a carload of pulpwood."

* * *

To Sell Ross Plant

Under the Bankruptcy Act, tenders are being called up to March 12 for the entire plant, equipment, fixtures and stock-in-trade of the Ross Can Co., Limited, of Bowmanville, Ont. The company manufactures paper and tin cans and have been in operation for the past four years. The value of the machinery, equipment and plant is placed at $128,244 and of the stock in trade, $26,936. The town of Bowmanville owns the building and land and in 1919 gave the Ross Can Co. a franchise by which it had a lease of the building and land for ten years at a rental of one dollar a year, free from taxes, except school tax, and the right to purchase the building and land for $35,000. The building itself cost in the neighborhood of $60,000. For the second ten years the Ross Can Co. were to pay a rental of $4,537 in monthly installments of $378 and also full taxes. It is understood that this franchise can be renewed to the new purchaser.

* * *

More Loss for Paper Men

Tenders are being called for the purchase of the stock in trade, presses, printing department equipment, calender finishing room equipment, etc., of the S. L. Davison and Hughes Engraving and Lithographing Co., Limited, 364 Richmond St. West, Toronto, who recently made an assignment. A number of paper houses being creditors for considerable amounts.

* * *

Gage Company Going Good

A very satisfactory report was presented at the annual meeting of W. J. Gage & Co., Toronto, which was held lately. Sorting business in the manufacturing stationery line at the present time is reported rather quiet but the orders for fall trade delivery are improving and the outlook is considered very good. All the old officers were re-elected as follows: President, H. H. Love; Vice President, H. F. E. Kent; Secy.-Treas. A. G. Parker. The company reports that the envelope business is getting better all the while.

Through the Middle West

TO REBUILD SRERE WAREHOUSE

oss by Fire Estimated at $30,000—Business Proceeding

PLANS to rebuild the warehouse of Srere Bros. paper mill at Franklin, Ohio, lestroyed by fire Monday with a loss esti-nated at $30,000, are already being made.

Howard Chaney, manager of the Srere in-erests in Franklin, has communicated with fficials of the firm in New York and is aid to have recommended the rebuilding of he warehouse at once.

It is thought the company will erect a stor-ge plant adjoining its present pulp mill, which as not touched by the flames.

Spontaneous combustion is believed to have aused the blaze which broke out Monday norning in the two-story brick and frame uilding, which was used for the sorting and orage of rags.

Thirty women employes, one of whom gave he alarm, fled to safety after seeing the ames spread, endangering their escape. They ere forced to grope their way through smoke the exits.

So hot were the flames that a box car on he Cincinnati Northern R. R. was damaged though it was standing several yards from he warehouse.

The building was covered by insurance and as declared to have been well-kept and uarded against fire.

The blaze was the first in several months fecting the numerous paper mills of the iami Valley.

* * *

Improving Allied Mills

Extensive improvements are being made at e Monarch Division of the Allied Paper ills, Kalamazoo, Mich. The cutters in the w-stock finishing room are being turned ound, the stands are being lengthened to ld fourteen rolls instead of eight, and they e planning on using three cutters instead of ur which they have been using heretofore. he other cutter is being moved to what is nown as the old coating room. Here five ating machines have been torn out, and irty girls are sorting in here. They also ve two cutters and two trimmers taking re of them. The other ten coaters are run-ng twenty-four hours, and the other finish-g room, employing twenty-five girls, is still operation. They have also lengthened out e of the coaters, so it can take a sheet 75" de. This is working out so well, they are anning on doing the same thing to another achine. Business is booming at the Allied.

* * *

Extensive Additions

A real estate transaction forecasting exten-e additions by the Standard Paper Com-ny at Kalamazoo, Mich., has just been con-ided between the company and the New rk Central Railroad. The transaction in-lves transfer of title to five acres of land tween the present plant of the company d the Kalamazoo River. The transfer paper s signed during the week by A. H. Smith, esident of the railroad, and Bartlett C. ckinson, president of the paper company. e latter refused to amplify his announce-nt that the company was contemplating ex-sive additions.

* * *

Harvey Back from Panama

eorge H. Harvey, of the Garner & Har- Company, Middletown, Ohio, has just urned home from a delightful trip to the est Indies and the Panama Canal.

George A. Whiting Weds

George A. Whiting, 74 years old, one of Wisconsin's pioneer paper manufacturers, surprised his friends when it was announced here that he had been married in Chicago on Monday. The millionaire paper man's bride is Mrs. Mae R. Babcock, who was the widow of Arthur Babcock of Wausau, Wis. It was at first reported that the bride had been a nurse in the Whiting home, but this was denied by the family. Her age was given as 49 years.

Mr. and Mrs. Whiting are spending their honeymoon in the south. They went to Florida and expected to visit Cuba before returning to Mr. Whiting's East Forrest Avenue home in Neenah.

Mr. Whiting's interests cover many sections of Wisconsin and the upper peninsula of Michigan. He came to Neenah in 1865 and founded the Whiting Paper Company with branches in Menasha and other cities. He also controls the Wisconsin Paper and Pulp Company, at Whiting, Wis., and the Proper Paper Company of Neenah, as well as the Whiting hotel at Stevens Point.

About two years ago Mr. Whiting was divorced by the second Mrs. Whiting who has been living for several years in Minneapolis. His first wife died twelve years ago. Mr. Whiting retired from active participation in his enterprises about five years ago.

* * *

To Study Waste

C. M. Baker, sanitary engineer for Wisconsin, has started a survey to determine for all time whether the waste dumped by papermills in the Wisconsin and Fox rivers has the deterrent effect on fish life that is claimed by sportsmen. For years there has been a debate as to the effect of papermill waste on fish life, sportsmen declaring that it practically has destroyed fishing in streams bordered by papermills. Most of the mills have installed save-alls which has reduced the amount of waste dumped into the streams but it is contended that considerable liquid, with solids, is being dumped into the rivers.

Samples of water have been taken at places where there are papermills and samples also have been taken of the waste. It is expected the survey will show the exact extent of the pollution, if there is any, and probably will result in regulations of suggestions for elimination of objectionable practices.

* * *

Goodman Now President

Directors of the Peshtigo Paper Co., of Peshtigo, Wis., have elected Charles Goodman of Marinette, as president of the company to succeed John Sutherland of Dayton, Ohio. D. C. Everest of Rothschild, Wis., has been elected vice president. Mr. Sutherland was president of the company since its organization a few years ago when the property was taken over from the Peshtigo Pulp and Paper Co. Several notable improvements have been made in the property since that time.

Announcement has been made of the resignation of A. C. Witherbee as general superintendent of the company. W. E. Swan, superintendent of the sulphite department, resigned recently and he has been succeeded by Max Boehm of Rothschild.

FALK CORPORATION HAVE NEW REPRESENTATIVES

Offices Are Opened by Company in Detroit and San Francisco

THE Falk Corporation, of Milwaukee, announces the appointment of representatives in San Francisco and Detroit to handle Falk Herringbone Gears and Falk-Bibby Couplings in those territories.

E. C. Myers is appointed to the San Francisco office with headquarters at 320 Rialto Building. Mr. Myers is a graduate of Syracuse University, where he took the four-year electrical engineering course. For several years he was with the General Electric Company, first at Schenectady and for about ten years in San Francisco. A little more than a year ago he opened a New York office for Cotton, Neill & Company, Ltd., and now joins the Falk Corporation after having had an experience that should make him a valuable member of the sales staff of that concern. His territory includes the states of California, Oregon and Washington.

Charels C. Walsh is appointed Detroit representative, with offices at 1500 Real Estate Exchange Building. Mr. Walsh received his engineering education at Highland Park College, Des Moines, Iowa. His career in the engineering and sales field has included service with the Michigan Central Railroad at Detroit, the Morgan-Wright Rubber Works, of Detroit, the S. K. F. Ball Bearing Company and the W. C. Du Comb Co. His activities have covered a wide range in both engineering and selling and he is thoroughly acquainted with the Michigan territory in which, together with Northwestern Ohio, he is to operate.

* * *

The Summers' Patent

B. S. Summers, of Port Huron, Michigan, has perfected a method of chemical control in connection with the manufacture of sulphite chemical pulp for which letters patent have been issued by the United States Government, according to the late *Patent Gazette*.

This is not the first time Mr. Summers has been to the front in connection with patents for fiber making industries, having also invented the process for making fiber rugs in use in so many states today.

This new chemical control of sulphite pulp, quick cooking was perfected and is in use in the Port Edwards and Nekoosa Mills of the Nekoosa Edwards Paper Company in Wisconsin and by this control a very much whiter and stronger fiber is produced, making the quick cook pulp more closely resemble the slow cooked or Mitscherlich pulp which has also lately been greatly improved by Mr. Summers at three of the Mitscherlich mills in Michigan, at Port Huron, Detroit and Alpena.

Mr. Summers is a graduate of Ann Arbor and has been a Manufacturing Chemical Consulting Engineer for many years among the fiber producing industries.

* * *

First Bleach-Making Process

The first bleach-making apparatus to be used in Middletown, Ohio, will be installed in the new $100,000 addition to the W. B. Oglesby Paper Co., contract for which has just been awarded to the F. K. Vaughn Building Company of Hamilton, Ohio.

Machinery already has been ordered and the new unit is expected to be in operation in a few months. In it also will be several beaters and rotary machines.

GROUNDWOOD SHORTAGE FELT BY WISCONSIN MILLS

Slight Curtailment in Production Pending Return of High Water

THE long continued low stage of water in the Wisconsin River has finally compelled a temporary curtailment of operations at the Wisconsin Rapids and Biron Mills of the Consolidated Water Power & Paper Company with main offices at Wisconsin Rapids, Wisconsin. No paper was made at Wisconsin Rapids mill Saturday, February 16th or Monday the 18th, and officers of the Company said that for the next thirty days it would probably be necessary to shut down the machines at both the Wisconsin Rapids and Biron Divisions for one or two days a week.

Low water last fall, which made it impossible to store up the usual quantity of groundwood for winter use, is the cause of the present curtailment. Usually a sufficient supply of groundwood is prepared in advance, during the periods of high water to supply the machines through the winter months, but during 1923 high water did not come when it was needed and the amount of groundwood prepared in advance, together with that shipped to them from their Canadian mill, has proved inadequate to keep the mills running at capacity.

Officers of the Nekoosa Edwards Paper Company of Port Edwards, Wisconsin, stated that they have recently installed steam turbines at both the Port Edwards and Nekoosa mills and these had freed Nepco mills to a large extent from dependency upon water power, and that consequently they were able to operate to full capacity at this time.

"Due to the foresight of the general management in providing auxiliary steam power and to the efficiency of the water wheel grinders that are able to operate absolutely no trouble is anticipated because of unfavorable water conditions," an officer of the company stated. "We are now operating at full capacity, in fact, are now making more paper than any time in the history of the Nekoosa Edwards Paper Company, and we expect to do so indefinitely without regard to the water situation."

The present curtailment in operations is a new thing to the Consolidated Company's mills, which has a record for continuous operation at full capacity that is believed to be unequalled by any other mill in the Wisconsin Valley.

* * *

Adds $150,000 Capital

The Valley Iron Works of Appleton, manufacturers of paper mill machinery and accessories has added $150,000 capital, it was made known through an amendment to the articles of incorporation just filed at Madison. This will give the company a capitalization of $550,000. The original incorporators of the company in 1900 were Augustus Ledyard Smith, William A. Fannon, and Emil A. Peterson. The amendment was signed by Ernest Mahler, vice president, and H. M. Burns, secretary.

* * *

Mead Heads Peerless

George H. Mead again heads the Peerless Paper Co., directors as chairman of the board as a result of the annual election of stockholders of the Dayton concern. Other directors are A. L. Rieger, R. T. Houk, Sr., W. N. Hurlbut, L. F. Berk, R. E. Cowden, all of Dayton, and H. P. Carruth, of Chillicothe.

The offcers are: A. L. Rieger, president and general manager; R. T. Houk, Sr., vice president; R. E. Cowden, secretary, R. E. Pohl, treasurer, and M. G. Benson, assistant secretary.

Kraft Pulp Odorless

A new process is about to be tried out at the Nekoosa mills of the Nekoosa Edwards Paper Company which it is hoped will eliminate the disagreeable odors in the manufacture of kraft pulp.

Laboratory tests to date have shown that this is possible and a more practical test is soon to be made in the mills themselves.

It had been expected that these tests would be completed without any publicity being given, but anything new in the pulp and paper industry in Wisconsin cannot be kept under cover long, especially in the Nepco mills where something new is being developed all the time and when the whole Wisconsin pulp and papermaking fraternity keep their eyes and ears focused for new things that may be seen or heard.

The new development will be given further publicity at an early date if the practical test is the success that the laboratory trial proved it should be.

Bertrand S. Summers of Port Huron, Michigan, is the inventor of the process, and he has already applied for patents on this process.

If successful, then perhaps, Chicago will have a kraft mill as an industrial possibility.

* * *

Unique Advertising Letters

The Nekoosa Edwards Paper Company of Port Edwards, Wisconsin, during the past month has been sending to its customers among the wrapping distributors of almost all of the States of the Union, a chain of letters descriptive of their mills, starting with Power Plants and going all down the line of pulp mills, both mechanical and chemical, the various paper mills, their finishing rooms and shipping facilities at the same time describing in each letter someone of the 300 odd grades of colors of wrapping paper produced by Nepco plants.

Samples properly identified accompany these letters of description and by the time the last letter reaches its destination, each one of these distributors will have received a complete line of samples with an idea of how each one is made.

The interest with which these letters are received and looked forward to from week to week, shows their value.

Nepco produces 10% of the paper made in Wisconsin, or about 200 tons per day.

* * *

Experimenting With Kraft

The Nekoosa-Edwards Paper Co., at Nekoosa and Port Edwards, Wis., is conducting experiments with a new process of kraft paper manufacture which the inventor claims will eliminate the odor usually accompanying the manufacture of that type of paper. The experiments, conducted on a small scale, will determine the feasability of the plan in commercial production and probably will be adopted in the mill if it is successful.

B. S. Summers of Port Huron, Mich., inventor of the process, says it is successful in laboratory experiments. He has conferred with officials of the Nekoosa-Edwards Co. which has arranged for the experiments in the mills.

* * *

Complete Finish Room

Announcement has just been made by the Champion Coated Paper Company of Hamilton, Ohio, of the completion of one of the largest finish rooms in the world. It is 290 by 150 feet and makes the east mill of this plant extend 1230 feet along North B Street.

The floor of the new addition was built to carry a weight of 500 pounds to the square foot.

MAKING SURVEY OF WISCONSIN RIVER

Effects of Paper Mill Waste Being Studied By State Engineer

A COMPREHENSIVE survey of the Wisconsin River to determine the extent and effect of pollution by paper mill wastes is well under way and a report dealing in detail with the subject will be published before the end of the year, it is revealed in the 1923 report of C. M. Baker, state sanitary engineer, which was made public at Madison recently. The survey will continue throughout most of the present year and will be the most complete ever attempted in Wisconsin, it is said.

Take Samples of Water

The survey, the report states, was started last fall, when samples of river water were collected from both above and below the sources of pollution in the vicinity of Rhinelander, Tomahawk, Merrill, Wausau, Mosinee, Stevens Point and Wisconsin Rapids. The samples are being analyzed but no report on the finding has yet been made public.

It is proposed to follow this survey by the collection of additional samples next summer at a lower stage of the river and under different climatic conditions. In addition to this, the report declares: "Investigations will also be made at each of the mills to determine the volume and character of the various wastes. Upon completion of this work, a comprehensive report will be made dealing with the effect of paper mill waste upon the streams of the state."

Investigation Made

This investigation, it is understood, is being made in an effort to settle for all time the controversy which has existed in regard to the extent of paper mill waste, and its effect upon the waters of the Wisconsin and other rivers.

* * *

Vocational School Soon

Paper mill plants in the Appleton district and industries closely allied to it are taking the lead in organizing a class in foremanship training. The first meeting is scheduled to be held on March 6 in the Vocational school in Appleton. Among the concerns which are interested in the movement and which have announced they will cooperate the The Thilmany Pulp and Paper Company, Kimberly-Clark Company, Appleton Wire Works, Valley Iron Works, Interlake Pulp and Paper Company, Wisconsin Wire Works, Tuttle Press Company, Patten Paper Company, and the National Fiber and Paper Company. Other industries will be represented in the movement which is expected to have an important bearing in teaching how to reduce accidents.

* * *

Logging Going Fast

Present conditions in Upper Michigan and Northern Wisconsin are reported ideal for logging, according to those who have visited the scene of operations. The abundance of snow has made it possible for contractors to continue cutting operations with increased rapidity, whereas early in the winter it was feared lack of snow would make it impossible to obtain a normal supply of pulpwood. The blizzard which temporarily blocked roads in Wisconsin the first week in February will have no bad effect, but on the contrary will make it possible to increase the output. The storm did its greatest damage south of Marinette and the country to the north there is just enough snow to aid in getting logs out of the woods.

In New England

Criticises Present Methods

Carleton W. Eaton, forestry engineer, speak-ig before the Portland Farmers Club, Februry 13, indulged in some criticism of present iethods of the taxation of timber lands. Folowing the address a committee of five with Ir. Eaton as chairman, was appointed by the lub to study the problems of taxation, reforstration and fire protection.

Four phases of Maine's forestry problem ere considered by Mr. Eaton; protection, ixation, management and reforestation. In pening he called attention to the fact that ie tree growth in Maine is not keeping up ith tree removal. With regard to fire protecon he said that there is an increasing annual verage of fire damage throughout the state hich indicates that remedial measures should e applied. Through forest fires, he said, a irge area is taken out of production every ear and heavy money loss results.

Insects also have wrought serious damage nd diseases must be reckoned with.

With regard to the management of Maine mberlands he had something complimentary say. In no other department had such rides been taken by Maine timberland owners, e said, and the time was not far distant when ie services of foresters for management ould be universal. It simply remained to ake all timberland owners up to follow the xample of larger companies in this respect.

Reforestation in Maine was proceeding ather too slowly, Mr. Eaton said. Maine has lanted to date, since the first efforts for reorestation were made, approximately 3,800,-00 trees, enough for about 3,800 acres. It iould plant almost that much annually in rder to keep up with the annual production f mismanaged land. Then the waste land ould remain untouched.

Mr. Eaton suggested that more coordination nd better morale of the fire prevention force as necessary as a remedial measure.

He suggested that the taxation problem ight be solved by a nominal annual tax on ie land and a tax on the timber when it cut, or when it reaches maturity whether is cut off that time or not.

As to management, he said that given better re protection and a more equitable system of ixation, the individual owner would be inpired to better manage his timberland proprty.

With regard to reforestation he said that Iaine's small state nursery was at present ntirely inadequate to meet the State's needs, nd that this situation should be remedied in far as was possible by funds that could be iade available.

* * *

Changes and Corrections

The American Writing Paper Company has ist issued a printed sheet recording a numer of changes in its Primary Lines which ave become effective since the "Handbook f Quality-Standards" was published. It is evised for inserting in the Handbook in order bring it up to date.

The emendations embody important revisions nd changes in weights, colors, watermarking, itroduction of new lines, etc. The matter is ivided off by perforations for readily tearing part, and each section is designated with the age number corresponding to the place where is intended to be pasted in the Handbook. he back is gummed for the purpose.

These correction sheets are being mailed printers and others who have the Eagle-A Iandbooks. The American Writing Paper ompany willingly furnishes copies to anyone iaking requests for them.

Extend Power Plant

Extensions and improvements of the big power house of the International Paper Company at Jay, Me., are under way. The lower windows in the structure have been bricked up preparatory to reinforcing the lower part of the building. A new plan of applying concrete will be used. Instead of pouring the concrete in the usual manner, a big concrete gun will be used, applying the concrete at a much more rapid rate than is possible by pouring.

It is understood that additional power machinery is to be installed early in the spring and that operations will be carried on by the company upon a considerably larger scale at Jay than in the past.

* * *

Buy Big Building

The Wakefield Paper Box Company, of Wakefield, Mass., has purchased the large building in the rear of the Brown Block, Main Street, Wakefield, owned by the Wakefield Real Estate & Building Association, which has been occupied by the company for several years under lease. The company plans to make some alterations and enlargements. The company has been located in the building since 1911 when it was burned out of its former location in the Cutler property fire.

* * *

This Ford Retires

Henry Ford of Melrose Highlands, for many years identified with the wholesale paper trade and one of the best known paper salesmen in New England, has retired from that field and has become associated in the shoe business, covering northern New England.

* * *

ANNOUNCE DATES OF 47th CONVENTION

Big Banquet Will Be Held on Thursday of Convention Week

THE formal call for the Forty-Seventh Annual Convention of the American Paper and Pulp Association is the dates announced being April 8 to 10 inclusive.

In general the program of the week will be as in other years. Tuesday, April 8, will be devoted, in addition to meetings of group associations representing manufacturers of the various grades of paper, to the Salesmen's Association.

The group meetings of manufacturing associations will be continued on Wednesday, together with the Woodlands Section convention of the central organization.

Thursday, April 10 will be devoted to the convention sessions and the banquet of the American Paper and Pulp Association.

There will be a radical change in program for the Association banquet, in that instead of political notables of national renown as speakers, those to be selected will be some of the nation's most prominent business men, and will talk on business, rather than political conditions.

The Salesmen in their program are to have speakers who will strike a popular note, and the banquet will be a dinner and smoker, rather than a dinner-dance as was the case a year ago.

The Technical Association will hold its convention during the week, and the National Paper Trade Association will also be in convention, all of the most important meetings being scheduled for the Waldorf-Astoria.

During the entire week the Second Paper Industries Exposition will be in progress at Grand Central Palace, making it a week devoted to paper in all the phases of the industry's development.

Railroad rates have been granted to those in attendance on the basis of one and a half fare for the round trip, and this will apply to all the associations of the industry, by joint arrangement with the American Paper and Pulp Association.

In the Far West

Are Working Together

The conclusion of a conference between Forester William Darby of the Canadian forest service and Supervisor Calvin Dahlgren of the Superior National forest which is under the jurisdiction of the United States forest service has resulted in an agreement for greater cooperation between the two countries in protecting from forest fires the woods and lake country adjoining the boundary line.

An arrangement was made to erect a new steel tower on Shortiss Island in the boundary waters and install telephonic connections with the Superior National forest Lac La Croix ranger station, which already has telephone connections with the local forestry headquarters. The Shortiss Island tower will be erected by the Canadian service and commands a view of a large section of country that has not had any tower protection.

* * *

Lightning Starts Forest Fires

John McLaren, fire chief of the Denver, Colorado, office of the forest service admits that some reports have reached him that the supervisors of the Holy Cross forest near Glenwood Springs, Colorado; the Hayden forest near Encampment, Wyoming, and the Shoshoni forest near Cody, Wyoming, explain that four lightning bolts were responsible for starting fires within their zone, during January, but says:

"In my experience in forest and fire work, I have never heard of lightning striking in winter. Temperatures within the forest were very low, and the out of season lightning did very little damage. We are endeavoring to account for the peculiar atmospheric condition which produced lightning during January."

* * *

Need Pulp Mill

Mark F. Mendenhall, head of a local power company, told members of the Spokane, Washington, Chamber of Commerce, recently that the increased demand for straw board, straw egg holders and other articles by the Inland Empire would warrant the establishment of a pulp mill at Spokane to supply the trade with these products.

He said that there was now enough straw on hand between Spokane and Walla Walla to furnish material to keep a mill in operation for more than a year, and he urged the establishment of a mill to cost approximately from $800,000 to $1,000,000.

* * *

Forest Exhibit by Manufacturers

The National forest exhibit at the Colorado Merchants and Manufacturers convention during the week of February 18-23 exhibited twelve samples of the native wood grown in Colorado, an informative tablet telling us that during 1923 there were 33,447,000 board feet cut, while there were 908 acres planted.

* * *

Carew Gets Contract

The Carew Manufacturing Company, Hadley Falls, Mass., has been awarded a government contract for 11 lots of paper totaling 493,000 pounds. The contract totals $132,000.

* * *

Power Plant Near Completion

The power plant of the American Tissue Mills, Holyoke, Mass., is nearly completed. McClintock & Craig, 33 Lyman Street, Springfield, Mass., are the engineers.

FORESTRY in the PAPER INDUSTRY

Conducted by J. R. Simmons, Secretary Forester, the New York State Forestry Association

IS CONSERVATION ADRIFT IN THESE UNITED STATES?

Review of the Situation Throws Much Blame on the Already Belabored Secretary Fall—Other Facts Brought Out

THE American Forestry Association, through its secretary, Mr. O. M. Butler, has issued a statement, from which we quote below, on the question "Is Conservation Adrift?" It is unquestionably a logical question if viewed in the light of recent developments in Washington.

Conservation is not adrift as a principle that has been adopted by the rank and file of the people of this country, or by the country's industries. The history of the forestry movement, briefly but accurately reported in recent issues of this journal, would indicate a fairly straight course towards a safe haven. But if we consider the officers in certain departments of the federal government as the sole agents entrusted with the commission of carrying forward a broad and stable program, then there are good grounds for believing that conservation is indeed drifting, and it will have to be a case of "shipping the pilot

A vast number of people have complacently rested in the thought that the basic conservation principles of the government were for the most part settled. Yet during two national administrations no definite progress in carrying forward the program which the people supposed was in effect has been apparent. Appropriations have usually been diminished rather than increased; a constructive policy has been lacking in relation to over two hundred million acres of public lands; fire damage has increased in Alaska; an attempt has been made to transfer the hard working and efficient Forest Service from Agriculture to the Interior,; and the bulk of effort toward correct forestry practice has come from private individuals and groups, and from the Forest Service.

"Looking back over the past half decade and more, what is the conservation policy of the American people as exemplified by their government?" asks the American Forerstry Association. 'The public, it may be suggested, is entitled to know."

"When Mr. Fall was appointed Secretary of the Interior, the federal policy of conserving public forest resources had become well recognized as a definitely established principle. Mr. Fall was known to be bitterly opposed to that principle. He was an openly declared anti-conservationist in spirit and in action. When he was thwarted in his plans to have transferred to his jurisdiction the National Forests in the western United States and in Alaska, many people construed the result as a conservation victory, although the nation was left in doubt as to whether the administration was supporting Mr. Fall or the defender of the principle, the Secretary of Agriculture.

"The Fall episode was not an indication of progress. It was a senseless obstruction in the path of the conservation movement—a costly mistake resulting from administrative wavering from a clear-cut conservation policy. Mr. Fall was permitted, if not encouraged, to precipitate his fight to scuttle the very best conservation agent of the Government, the Forest Service. In doing so, he first lifted the curtain upon the instability and indecisiveness of the conservation policy of the nation, as exemplified by the representative government at Washington. Had our policy been as clearly and as securely established as it should have been, and as sacredly respected by the party in power, Mr. Fall's aggressive campaign as a freebooter of public resources would never have begun.

"The unrestrained activities of Mr. Fall, as a trustee of public property, reveal similar governmental instability and confusion in the conservation of other public resources. While Secretary of the Interior he promoted a bill for the creation of the All-Year National Park in the vicinity of his own land holdings in New Mexico, which, if enacted into law, would have been destructive to the basic principles of National Park conservation. It is significant of the point that his bill was actually passed by the Senate and it was defeated primarily by the protest of an indignant public, aroused by men and organizations wholly outside and unrelated to the government.

"Four years ago the Water Power Act and the Coal, Oil, and Gas Leasing Act were passed by Congress. These bills established the conservation principle that the title to waterpower and coal, oil and gas, owned by the government, should not pass from the government. To men like Mr. Fall, these principles appear to have had no meaning and no sacredness. Nevertheless, the unsympathetic Mr. Fall was commissioned with the public trust of administrating those very acts. As long as anti-conservationists are placed in positions of trust over public resources and as long as they are not held to strict accountability in respecting and carrying out established conservation policies, there will be Teapot Dome scandals. They are merely the sordid products of a lose administrative attitude toward conservation.

"The absence of definite progress on the part of the administration in carrying forward a broad program of conservation during the past four years is strikingly evident. The situation is one rightly causing wide-spread public concern. We are still without a constructive policy for the handling of our 220 million acres of public lands, not including the national forests, 150 million acres of which are steadily becoming more and more unproductive because of uncontrolled grazing. In Alaska fires continue to ravage millions of acres of public domain, with no policy yet affected for handling or protecting these lands. Game protection in Alaska is a farce and political make-shift, because Congress fails to provide the amount of money needed for effective game conservation.

"Before the war, the passage of the Weeks Law established a federal program for the acquisition of six million acres of forest land on the headwaters of navigable streams. The Federal Government appropriated $2,000,000 annually, for a short period of years, for the purchase of these forest lands, and then, with the purchases only one-third completed, it departed from the program. Thus far, it has refused to restore it to more than 50 per cent of its original scale. For the forthcoming year, the Forest Service, whose administration of the National Forests stands out as one of the brightest spots in the conservation firmament, is now confronted with reduced appropriations.

"In the face of this apparent slowing up and dissipation of the conservation movement, the report of the Senate Committee on Reforestation brings home to the nation the urgency of prompt action to assure its people a supply of raw wood. Despite a strong public urge during the past five years, we are still without a national forest policy. The report of the Senate Committee does not expose a hitherto-unknown situation, but merely adds authority to previous investigations which the United States Forest Service has made, but which have failed to stir the government to action. That the situation with respect to our wood supply is critical, Congress must now admit. Will it act? And if it does, will it give the nation the broad, comprehensive policy which the situation imperatively demands?

"The Senate Committee on Reforestation has, through Senator McNary, introduced a Bill which provides for constructive legislation and authorizes appropriations. The Bill is one which everyone will endorse. Its passage will mark a constructive step toward in formulating a national policy for forest conservation. It has strong public support and it should be enacted at once. Bills somewhat similar have been before Congress during the past several years. Congress has turned them aside. If the McNary Bill suffers the same fate, the present administration will indeed have lost the opportunity to restore public confidence in its conservation platform.

* * *

Research in Paper Field

How the Northeastern and Lake States Forest Experiment stations of the United States Forest Service are planning for their research work, particularly for the pulp and paper companies in those regions, was told to the New York Forest Club at a recent meeting. About twenty foresters were present, and plans were made for a spring field trip as a wind-up of the season's series of meetings. Samuel T. Dana and Raphael Zon, directors of the two experiment stations were the speakers, and told of the growth and other studies which are in contemplation. Mr. Dana told of the work being done in reforestation in the pulpwood producing region, while Mr. Zon called attention of the foresters to the manner in which the jack pine, once despised, is coming into prominence as a valuable tree to the western paper mills.

HOW MUCH LAND SHOULD GOVERNMENT OWN?

Question Arises Between Government and Private Interests

THE question of how much land the federal government should properly own, and how much should remain under private management for the best interests of the country at large, and for the country's industries in particular, is one that has arisen for discussion in recent conferences between the federal authorities and the private interests.

That the government and private interests must work together, and that neither should own or control all of the forest land area of the country was the opinion expressed by Dr. Baker, Executive Secretary of the American Paper and Pulp Association at the recent Washington conference. Dr. Baker's statement as given by the department of Agriculture indicates that his organization contemplates the probable acquisition by the government of approximately one-third of the forest land, while private interests will need to handle the other two-thirds with a view to perpetual supplies. The statement is as follows:

"The paper and pulp industry can not turn its raw material problem over to the Federal Government. The industry must spend its own money and create its own leadership to work out this problem, getting the help and advice of the Forest Service. The Federal Government will probably have to acquire at least one-third of the forest land of the country, but private initiative will have to be depended on to properly handle the other two-thirds of our forests and will have to undertake this task in the very near future."

* * *

Looking to the Future

The Louisiana forestry authorities are now judging the boys forestry contests in which 650 boys were enrolled as competitors for a total of $805 in prizes. Of the prize money $500 was offered by the Great Southern Lumber Company, the same organization which controls the Bogalusa Paper Company, and which is doing an important work in promoting forestry in the state of Louisiana. The company has placed between 50,000 and 100,000 acres of land under cooperative forestry management with the state authorities. The Louisiana Forestry Board at a February meeting made plans for continuing the boys forestry club work in 1924, and heard the interesting report that the development of forestry sentiment in Louisiana during 1923 made it possible to reduce the area of land burned over during the year to 285,000 acres, as compared with 1,200,000 acres two years previously.

Definite forestry work among the youth of the land began as a general movement just after the World War. The Louisiana plan has received widest publicity because of its perfection of organization. Similar work, however, is under way in other sections of the country, notably in the Northeast, many pulp companies and timberland owners cooperating. In New York, the Forestry Association has trained Boy Scouts in fire prevention and reforestation and has succeeded in reclaiming upwards of five hundred acres of land with Scout labor. Several projects were carried out on privately owned land in 1923, under the auspices of the association in cooperation with paper and pulp companies and other industrial groups, and the outlook for the coming planting season is excellent.

Cost of Reforestation

Interesting figures on the cost of reforestation operations of pulp and paper companies as well as of state and federal operations, have been given out by the Woodlands Section of the American Paper and Pulp Association. The private planting is the most expensive, the chief difference being in the labor costs.

New York state figures, based on 1,200 acres of private planting, show a total cost of $12.61, but one company's operations cost $23.33 per thousand trees. The general figures, however, were much lower, the planting cost being $7.84 per acre, and stock being $3.86. A New England figure, based on 200 acres only, shows a cost of $24.99 per acre, but the stock was expensive, being $9.44 per acre, and the planting cost being $13.58. In the middle Atlantic states the stock was much cheaper, and figures based on 600 acres cost a total of $10.46, with 1,570 2 year seedlings to the acre.

Northeastern state forest operations vary widely, from $9.44 in Pennsylvania to $17.15 in Massachusetts. The Massachusetts stock cost was $9 and the planting cost $7.15. New York planting where seedlings were used cost only $11.80 per acre.

Federal government operation in Michigan, where pine was used show a cost of $4.50 per acre, with seedlings, while in Minnesota the figure was slightly higher, being $5 per acre. In these figures, however, the fact should be noted that only 700 to 800 trees are planted to the acre, instead of 1,000 to 1,500 on the private tracts. In Minnesota where older stock was used the cost rose to $9.12 per acre. The large acreage planted, and the fact that the federal operations were for the year 1922 account in part for the lower cost as compared with the state and private planting reports.

* * *

Fire Prevention in Quebec

A radical change in the method of handling the forest fire question in Quebec was described to the provincial assembly by Honore Mercier, minister of lands and forests. The new policy is that the limit holders will be expected to protect their own forests from fire the coming year, while the provincial authorities will look after the matter in the other forest areas of the province.

He announced that the government plans to introduce legislation soon for a new organization of fire fighters, in line with the suggestions made at the recent colonization congress. There will be a force of uniformed fire rangers, all through the district, all of whom will be responsible to the government, through the forest ministry, and all will be expected to file with him a preliminary report showing their plans for organization of their respective districts.

During the debate the question was asked whether the method of erecting fire towers in use in the United States would be part of the plan, and Mr. Mercier stated that this was part of the plan. The regions would be so mapped that fires could be spotted and located by coordinated reports of the observers, made by telegraph, telephone and wireless.

Asked as to the policy relative to brush burning by settlers, Mr. Mercier stated that there would be no interference with rubbish burning on settlers lots. One representative pointed out that a single county last year suffered a loss of $2,300,000 from forest fires.

When questioned, Mr. Mercier said the fire prevention policy of the past three years had proved a failure, and a radical change was necessary. The use of aeroplanes, he said, had been successful, and the assembly finally appropriated the money asked for the maintenance of the new fire prevention system.

FIRE WARDENS GUARDING MUCH TIMBER

Twenty-Six Million Acres Under Guard in Oregon, Report Says

THE fire wardens are guarding more than 26,000,000 acres of timber in Oregon. Some of these wardens are appointed by the federal government and some of them obtained their positions from private state protective organizations. The Federal Forest Service, the State Forestry department and the seventeen private protective associations are cooperating in an effort to keep the wild fires out of the Oregon forests.

Of the area guarded by the wardens 58 per cent is in Federal ownership and 42 per cent is in private or state ownership.

There were 627 wardens employed in 1923 to guard these forests. 235 of them were Federal and 392 state wardens. Private owners of timber, sawmills, etc., paid 93 per cent of the state wardens leaving only 7 per cent of them to receive their pay from the state.

The state forester reports that although there was no noticeable difference in the number of fires occurring in 1923 yet 40 per cent less area was burned over than the average for the past ten years. He said that 73 per cent of the fires were controlled before they had burnt a ten acre area and 216 before they had spread over one-quarter of an acre.

Outside of the National forests in Oregon the area of forest type lands burned over was 45,136 acres, entailing a total loss of approximately $190,000.

A criticism of the big timber owners in Oregon is that after logging over a piece of timber they then neglect to safeguard it from fire with the result within one or at least two years it is swept over by fire which destroys all the life of the young timber or seeds on the logged land. It is easy for fires to burn in these logged areas. Each year a larger number of private owners are taking precautionary measures to prevent these fires and thus have natural re-forestation take place.

* * *

Future of Lake White Pine

Of the 350 billion board feet estimated to have comprised the original stand of white pine in the Lake States, 300 billion have been cut, more than 40 odd billion have been destroyed by fire, and possibly five billion board feet, mainly in Minnesota, remain to be cut, according to the Forest Service, United States Department of Agriculture.

What can be expected in the future for this economically important tree is at present a subject of study by the Lake States Forest Experiment Station. Twenty-five years ago Prof. Filibert Roth, until recently Dean of Forestry, University of Michigan, estimated that there were then 200,000 acres of second-growth white pine in Wisconsin. Since then fires on cut-over land have considerably retarded additions to this area and have to some extent reduced the original tracts.

Michigan and Minnesota probably have each as much as Wisconsin, or more. While this second growth is very open, the fact that the old forests yielding 5,000 to 40,000 board feet an acre ranged only from 12 to 100 trees to the acre indicates that good yields may be expected from the second growth stands, and at considerably earlier ages than those of old-growth areas.

Second-growth white pine in the Northeast is now bringing an average of about $14 a thousand on the stump, and there is every evidence that stumpage prices in the Great Lake region will in not very many years prove so favorable that second-growth white pine will be recognized by lumbermen and farmers alike as a crop worth far more than the cost of the protection and care necessary to secure its best development.

PAPER PRODUCTS

COMPETITION AND THE BRAND NAME

The Value of a Brand Name Explained as regards Competition—New Ideas Expressed

By J. E. WILLERT

GIVE me a pound of coffee. It is not so long ago when we wanted a pound of coffee this is what we said, in fact we wanted a pound of sugar, a pound of soda crackers, we said so, not so now, it is a brand we want. If it is coffee a coined name or the name of a hotel, if it is sugar it is a mask or the name of some creature of our own creating, if it is crackers, we are told of our need or issued a command.

So it is all down the long line of food products, clothing, shoes and household necessities, every age, all literature, are called on to furnish the name of a brand.

There are two kinds of competition, destructive and constructive.

Destructive competition is that which seeks to reduce a price in order to obtain the purchase. To do this a degeneracy of quality has to take place as the competition is continuous, the limit of reduction of profit and cost of production is reached and, naturally, this degeneration has to begin. Quality is thrown away and the selling of price and terms begins.

Constructive competition is that which attempts to gain business on a basis of quality backed by responsibility, the inculcating of the public mind with a fixed idea of the distinctiveness of the merchandise, its superiority over competing merchandise and its ability to better perform the task for which it was made.

The introduction of the Brand came at an opportune time, destructive competition was in full sway, quality was degenerating, ingenious wholesalers were offering premiums of all kinds to the retail dealer to draw his trade and direct his mind from the reduced quality.

The people were the sufferers, at this time pure food laws were being introduced into the legislatures checking the degenerating of food stuffs, but other articles of trade could not be reached.

The coming of the brand at this time changed the whole method of competition, self expression in merchandise appeared, first in food stuffs, then in clothing, shoes, etc., and then through the whole realm of commodities, eating into every phase of commercial life.

Constructive competition took charge with the coming of the Brand. A branded commodity must have backing, the maker's name must appear on it and appearing it becomes the guarantee of the quality, therefore quality must be supreme that the dignity and honor of the maker be maintained.

A new style of competition, the intense effort to improve the grade, untiredness to increase the service, attractiveness—a great aim.

A proclamation of the several virtues of every brand must be sent forth, the creative minds of advertising men were brought into play, every art is now used to impress the public mind with the goodness of every man's product.

This is good. It compels a maintenance of quality, an extension of service and a continuous effort to improve.

There is in such a condition a temptation for some makers to produce a commodity branded with a name, which has in its cadence the same sound as the original, this deception however, is soon discovered by the public and the attempted deceit soon redounds to the benefit of the responsible maker.

Brands and watermarks have entered into the paper field and are being advertised freely, the trade at large is benefited, a splendid help to the jobber, to the printer and to the consumer.

There is danger of a multiplicity of brands bringing about a confusion in the buyer's mind. A few brands thoroughly concentrated on are great order bringers.

The question of whether a jobber should sell his own individual brands or should handle only the nationally advertised brands is one for solution.

It is accepted that every jobber has his own clientele who have complete confidence in him and will take his guarantee as the last word in quality but, on the other hand, there steps in the getting of new trade who are impressed with the national brands, this condition far outdistances the advantage that there may be in individual brands.

A national brand backed by a jobber's guarantee is a combination that cannot be beaten.

The brand has come to stay, the jobber is helped, the retailer benefited and the consumer satisfied.

Quality cannot be cut, consumption is increased and prices are maintained at a proper level.

Constructive competition is based on quality plus brand and Brand is based on the responsibility of the maker, whose success is entirely dependent on his maintenance of quality.

* * *

Talk of Association

Much favorable comment is being made on the organization of an association of American Paper Specialty Manufacturers.

Many jobbers have expressed the opinion that this was a splendid step for this particular branch of the paper industry to make.

A center of information both for the jobber and manufacturer will be of valuable assistance.

Paper Specialties need distinct attention.

VORTEX COMPANY IS WINNER OF SUIT

For the past year, the United States District Court at Buffalo, Honorable John R. Hazel, District Judge, has had before it the case of The Vortex Mfg. Co., of Chicago, versus the F. N. Burt Company, Ltd., of Buffalo, N. Y.

This case, that is of interest to the entire drink-dispensing industry, has just been decided by Judge Hazel in favor of The Vortex Mfg. Co.

The Vortex concern brought suit against the Burt Company for an alleged infringement of the Vortex re-issued patent No. 15,381, covering the blanks used in making the Vortex paper cups.

The Burt Company, according to the decision handed down by the Judge, "entered the field with its paper cone cup in 1918." It was not until the latter part of 1922 that the Vortex Company, failing to dissuade the Burt Company by peaceable means from making a paper cup in a closely similar manner, decided to appeal to the courts.

In its defense, the Burt Company sought to establish four points justifying its action in imitating the Vortex Cups. Judge Hazel, in the decision just rendered, declares that none of these points has been established by the pleading of the Burt Company.

In conclusion, Judge Hazel says, "In my opinion—the structure manufactured by the defendant company (Burt) is an infringement. A decree for the plaintiff with costs."

Charles W. Hills, Sr., Chicago patent attorney, who represented The Vortex Company in the suit, is authority for the statement that the decision broadly holds validity of the Vortex re-issued patent and the infringement of the claims in suit.

"Every one of the seven claims involved in the litigation was sustained as valid and infringed," said Mr. Hills.

The Vortex Mfg. Co., is now bringing out several new products. It is also making improvements in its present line of cups, at no increased cost of manufacture. These products should be favorably received by the drink dispensing trade.

* * *

Take on New Line

The further activities of the enterprising firm of Meikle & Wood, Baltimore, Md., will be employed in the interests of the American Paper Forming Co., manufacturers of Diamond A Paper Plates, for whom they will act as Sales and Distributing Agents in Pennsylvania, Maryland and Virginia. The lines handled now by this firm are,—

Menasha Printing & Carton Co.
Robertson Paper Co.
Green Bay Paper Napkin Co.
North End Paper Co.
Consolidated Paper Bag Co.

* * *

Mr. Arthur W. Blackman, President of D. F. Munroe Company, Boston, has just returned from a thirty day trip through the West Indies.

They Heeded It

In the February issue of *The Mail Bag* there is a splendid article entitled, "The He-Man Hint They Heeded." It tells of one W. O. Ben Johnson, superintendent of the Woronoco Mills, and his many activities. Not satisfied with being superintendent, he is acting postmaster, moderator of town meetings, lecturer at the High School, leader of the men's glee club, Mayor of the town, and several other jobs. During the war he was fuel administrator, liberty loan chief, and a whole lot of things.

Being elected secretary of the Hampden County Traffic Association and finding laxness in meeting attendance, he sent out a letter which we give herewith.

Traffic Mgr. and Brother Member:

Please pardon my frankness, but on account of lack of space you will realize necessity.

Why don't you attend meetings of your Association?

Is it because:

You have no traffic problems to solve?

You are proficient to the extent of needing no assistance?

You are familiar with all changes in classification, rates, routes, demurrage, and a hundred other things?

You feel individual action more efficient than united effort in filing protest relative to these changes?

You think your Association can accomplish nothing?

While I do not advocate our Association knows everything, I do say frankly that the combined knowledge of its members far exceeds that of any one of us.

No matter how much or how little you know, we need you and you need us.

To my mind there is only one thing that should cause your absence, viz., lack of time. If such is the case, send an understudy as he will be heartily welcome.

What we want is full attendance at our meetings, and with this everything else will follow.

Please write me as frankly as I have written you.

Yours very truly,
Hampden County Traffic Association.

'Tis some letter, written in a language understandable, and it brought results. As *The Mail Bag* states, the business world can stand a lot of letters that don't need an interpreter to find out what they are getting at.

* * *

New Plant Started

A new plant for shredding of paper for packing purposes has been established in Appleton by William Harrison. He has taken possession of a building near the foot of John Street hill. Paper is purchased from the Appleton mills. The shredding is done by a new machine which he has just installed.

* * *

Hold Open House

The Victory Bag Company of Marinette, Wis., recently held open house at its plant inviting the general public to inspect conditions and become more familiar with the work done. Tours through the plant were conducted at 2:30 and 3:30 p. m. Many visitors took advantage of the invitation and remarked at the cleanliness and neatness of the girls employed. The purpose of the movement was to impress on the public the favorable working conditions provided for employes.

Twiller Sales Talks

Irresponsibility and disaster are pals. Be responsible, success goes with it, they are twins.

Don't be a Niagara in your talk be a Niagara in your power.

* * *

Discover yourself first and then cultivate what you discover.

* * *

Look a fact squarely in the face, make friends with it, then it will work for you.

* * *

When you start to build something stay with it till you shingle the roof, then live in the house you've built.

HEARING SOON ON NEW RATES

Many Paper Companies Join In New Protest

PROTESTS have been lodged with the Public Utilities Commission of the State of Maine by the Maine pulp and paper mill interests against the increase in freight rates of the Maine Central Railroad on pulpwood.

The Public Utilities Commission has ordered a hearing on the protest for next week, at the State House at Augusta. It is probable that the greater part of the pulpwood industry of the state will be represented at this hearing.

The new rates became effective on February 5. The rates were promulgated by the railroad, it is alleged, without an advance notice of sufficient length to permit the filing of a protest or a request for a hearing.

The pulp and paper petition alleges that the railroad has, within recent years, made three heavy advances in the rates on pulpwood and that the further increase is made in the face of a decrease of ten per cent in operating costs of the railroad since the close of the war, hence the rate raise is not justified.

Joining in the petition to the Public Utilities Commission are the following concerns: Oxford Paper Company of Portland, the S. D. Warren Company of Cumberland Mills, the Eastern Manufacturing Company of Bangor, Orono Pulp & Paper Company of Orono, Penobscot Chemical Fibre Company, Advance Bag & Paper Company of Howland, Poland Paper Company of Mechanic Falls, Maine Coated Paper Company of Rumford, Nekonegan Paper Corporation, Pine Tree Pulp Company, Keye Fibre Company, Skowhegan Paper Company of Skowhegan, Androscoggin Paper Company, South Windham, Gilman Paper Company, Cushnoc Paper Company of Augusta and the Kennebec Paper Company of Skowhegan. In addition to those signing the petition, representatives of other paper and pulp companies will be present.

* * *

Paper Company At The Helm

When the "All For Colorado" Association was mentioned as a good thing to make better business conditions and feeling throughout the entire state of Colorado, the suggestion coming from the Colorado Editorial Association, the Butler Paper Company, of Denver, was one of the first to sign on the dotted line. The purpose of the association is to make the folks in the small town feel that they are as much of the business of the state as those in the larger cities. THEY ARE.

Paper Men at the Exposition

The annual carnival of the Colorado Merchants and Manufacturers Association was held in the Denver municipal auditorium during the week of February 18-23. There were upward of two hundred exhibits.

Myers Pulp and Paper Company's booth with a large bundle of scrap paper had a card sign alongside: "Save your waste paper. We use this in the manufacture of paper products."

On the front railing was a pyramidal form which showed the pulp in various stages, and a booklet of 20 pages, spread out, each leaf a sample of the different kind of card board made by the company, the caption of the book "A Sample of Our Products."

Next booth was that of the Inland Paper Box Company, of Denver, its exhibit consisting of the various shapes, sizes and colors of paper boxes. Very natty.

Adjoining the Inland was the booth of the Continental Label Folding Box Company, Denver, and if color photography was practicable, a photograph of that booth was worth anyone's attention.

From scrap paper to beautiful boxes and gorgeous labels, the story told within a few feet of space, yet how wonderful has the paper industry and kindred arts kept pace with all other arts and crafts.

* * *

Short Newsy Items

The Western Paper & Envelope Company has been incorporated in Long Beach, Cal., with a capital stock of $220,000, by Bert P. Boles, J. Q. Garwood, H. F. H. Schneider, Frank H. Jaques and Leigh A. Hume.

* * *

The Burford-Bohlinger Paper Box Company has been incorporated in St. Louis, Mo., with a capital stock of $25,000, by Alfred P. Bohlinger, Jr., of St. Louis; Wesley C. Buford, Webster Grove, Mo., and others.

* * *

The Tennessee Paper Mills, Chattanooga, Tenn., is expending $75,000 on installation of steam power plant to increase the capacity of the plant from fifty to sixty tons of paper box material per day.

* * *

The Crystal Springs Bleachery Company, Chickamauga, Ga., is in the market for machinery for the manufacture of paper bags.

* * *

The New Orleans Corrugated Box Co., New Orleans, La., has let the contract for erection of a $12,000 factory building at Oleander and Bernadotte Streets.

* * *

The International Harvester Company has purchased the factory building of the New Orleans Corrugated Fiber Box Co., New Orleans, La., and will turn it into a tractor and implement house.

* * *

Fire Destroys Warehouse

A fire of unknown origin destroyed the warehouse of the Grimes Waste Paper Company, 11th and Wynkoop Streets, Denver, Colorado, on the night of February 16. Loss about $10,000.

* * *

To Use Old Paper Mill

The old plant of the Denver Factories Company, an old paper mill, located right along the railroad at South Kalamath and Mississippi Avenue, Denver, Colorado, has been purchased by a new incorporation, the Colorado Central Railways Company, and after alterations the new concern which is a branch of the Missouri Car company of St. Louis, will manufacture both steam and electric railway cars.

OFF GOES THE LID FOR CONVENTION

First Announcement Made for Annual Superintendents' Conclave

THE General Committee of The American Pulp and Paper Mill Superintendents Association, reports that the arrangements for the coming convention, which will be held at the Miami Hotel in Dayton, Ohio, May 22, 23 and 24, 1924, are practically completed.

There will be some worth while doings all the time. Superintendents are warned to be prepared for three of the largest and busiest days of their lives.

The program will be replete with information and knowledge of the art of Pulp and Paper making, and the papers on subjects of vital importance to the Superintendents will be written and given by the ablest man, in and out of the industry.

There will be entertainment and dinners in the evenings as usual. Special provisions have been made for the entertainment of the ladies.

Hotel accommodations have been reserved in the leading hotels of the city, and members who expect to attend are requested to send for their resevations early, to the Chairman of the General Committee.

"COME ON. LET'S GO. There is going to be a surprise in store for you at sometime during the convention, that you cannot afford to miss," says the General Committee to all Superintendents.

Here is the complete membership of Committees who are working for the success of the convention:

General Committee — H. W. Server, Chairman, (The Miami Paper Co., West Carolltin, Ohio), F. R. Henry, John J. Maloney, B. T .McBain, Homer D. Martindale, Thos. E. Keogh, Tom Harvey, Michael Ludwig, Jr., Henry F. Obermanns.

Arrangements—Dr. F. R. Henry, Chairman, (The A. A. Simonds-Dayton Co., Dayton, Ohio), H. G. Funsett, Al. O. Rolfe, Adam Ritz, William Battles, Benj. Bishop, Homer H. Latimer, John A. Tully, and R. F. Englehart.

Reception—John J. Maloney, Chairman, (The Franklin Coated Paper Co., Franklin, Ohio), Dan Daverin, Can. Div., B. T. Larrabee, N. E. Div., F. L. Barstow Conn. V Div., M. J. Argy, No. N. Y. Div., Chas. Aull, Miama V Div., J. F. Yordy, Miama V Div., E. H. Gilman, Mich. Div., Chas. E. Raney, West. Board Div., Jos. H. Slater, N. W. Div.

Resolutions—B. T. McBain, Chairman, (Nekoosa-Edwards Paper Co., Port Edwards, Wis.), S. F. McHenry, Can. Div., B. T. Larrabee, N. E. Div., John J. White, Conn. V. Div., H. Stafford, No. N. Y. Div., L. T. Murphy, Miami V Div., E. H. Gilman, Mich. Div., C. E. Nicely, West. ~~Board Div. and~~ L. E. Smith, N. W. Div.

Registration — Homer D. Martindale, Chairman, (The Shartle Bros. Machine Co., Middletown, Ohio), E. D. Burgess, Can. Div., B. M. Betrie, N. E. Div., T. F. Rogan, Conn. V Div., F. J. Rooney, No. N. Y. Div., John J. Maloney, Miami V Div., George Pountain, Mich. Div., Claude Nicely, West. Board and John Hercher, N. W. Div.

Transportation—Thos. E. Keogh, Chairman, (The Peerless Paper Co., Dayton, Ohio.), W. T. Schenk, John Calder, Martin V. Brooks, Jos. M. Cathcart, W. W. Winship, J. Howard Stansell, John F. Yordy, G. S. Martindale, Fred Belden, C. H. Noble and Fred Leuders.

Visitation — Tom Harvey, Chairman, (The Gardner-Harvey Paper Co., Middletown, Ohio.), Al. O. Rolfe, Michael Ludwig, Jr., Frank Smith, C. E. Goodenough, Oscar N. Jones, L. T. Murphy, Jack Smith and Michael Redmond.

Press Committee—Thomas J. Keenan, PAPER, L. D. Post and John Cornell, *The Paper Mill & Woodpulp News,* A. A. Tanyane, *The Paper Trade Journal,* E. Scott Dowd, the *Paper Industry.*

Paper—Larry Collins, *The Dayton Journal,* Frank Hunt, *The Dayton News,* Ednor M. Rossiter, *The Dayton Herald.*

GENERAL ELECTRIC GIVES 48 AWARDS

Charles A. Coffin Foundation Honors Employees for Meritorious Service

FORTY-EIGHT employees of the General Electric Company, scattered through factories and offices all over the United States were given awards of money and certificates by the Charles A. Coffin Foundation in recognition of outstanding services performed during 1923.

The winners comprise ten shop men, ten foremen, sixteen engineers, six commercial men, five administrative employees and one woman—a stenographer in the Pittsfield works. One of the groups, W. B. Cordes, is marine superintendent in the New York office and a frequent contributor to PAPER. He is given an award for quick action in preventing one of the new electrically propelled municipal ferryboats from running into collision with the slip during the official trials of the vessel.

The forty-eight were selected with the greatest care from among 80,000 employees of the General Electric by a committee of officials headed by President Gerard Swope.

William Le Roy Emmet, a consulting engineer, is one of the recipients through his development of the mercury boiler. The most notable achievement among the foremen was that of Louis E. Mitchell and Arthur J. White of the National Lamp Works in Cleveland in perfecting apparatus for the manufacturing of tipless incandescent lamps.

W. J. Delahanty, a salesman attached to the San Francisco office, was awarded for putting in four days and nights untangling a power plant damaged by a short circuit. John B. Cox, field engineer of the railway engineering department, won an award in connection with the electrification of the Mexican Railway, and Oliver J. Nichlaw, of the contract service department, on electrical installations in India.

These awards mark the completion of one year's work of the Charles A. Coffin Foundation, established by the General Electric Company in May, 1922, as a tribute to one of the founders, who for a long time was president of the company.

Control of Blister Rust

Control of white-pine blister rust, a disease which is a most dangerous forest enemy, is necessary if the white pine industry is to be perpetuated in the West, where the disease is already present. Simple and practical methods are available to any pine owner in the Eastern United States which enable him to safeguard his pine from the disease, says the United States Department of Agriculture, and vigorous action is required to develop and apply measures that will minimize the damage in the West.

Box Company Established

The Fall River Paper Box Company has been established at 1831 Pleasant street, Fall River, Mass., and as soon as machinery is installed, will commence the manufacture of paper boxes. Alexander Shapiro is proprietor of the new company.

SALESMEN TO GATHER APRIL 8

Agitation Starts to Make the Annual Meeting a Big Success

THE most important convention in the history of the Salesmen's Association of the Paper Industry will be held in New York April 8, when the salesmen of the industry will take up problems of the greatest importance to the American mills.

Following up the campaign originated by the American Paper and Pulp Association for the restriction of abuses of the customs laws by the importers of foreign paper, the Salesmen's Association at the Monday meeting which discussed convention plans decided to devote much of the convention program to this matter.

"This, I regard as the most important question before the industry today," said President J. L. Fearing, addressing the Salesmen, "and the Salesmen's Association can do no bigger thing than to get aggressively behind the movement to stop the improper importation of foreign paper."

The American Paper and Pulp Association has been continuing the efforts to restrict violations of the customs acts, the import conference in November being devoted entirely to this important movement. When Warren B. Bullock, who has been assigned to investigate customs cases on behalf of the American Paper and Pulp Association, became temporary secretary of the Salesmen's Association one of his first steps was to have Dr. Baker, executive secretary of the American Paper and Pulp Association, take up this matter with the Salesmen's Association, in an effort to secure the co-operation of the salesmen in the parent organization's work on this problem. The result is the decision of the Salesmen's Association to make the import problem its chief topic of discussion at the coming annual convention.

Swedish Pulp and Paper Prices

Prices quoted on woodpulp in the Swedish market at the end of the first two weeks in December, according to a report received from Consul General D. I. Murphy, at Stockholm, were as follows: Bleached sulphite, first quality, 250 to 285 crowns; easy bleaching sulphite, 205 to 225 crowns; strong sulphite, 180 to 200 crowns; strong sulphate, 180 to 195 crowns; wet mechanical ground wood, 55 to 65 crowns. All prices f. o. b. per metric ton, Swedish port. While a number of changes have occurred in woodpulp prices, quotations on papers remain the same, kraft wrapping ranging in price from 280 to 580 crowns; and M. G. sulphite from 340 to 540 crowns, according to quality. Greaseproof and newsprint papers are quoted at 450 crowns and 280 crowns, respectively. Swedish crown=$0.2621 at present rate of exchange.

Large Production of Newsprint

Starting the first manufacture of paper in the Maritime Provinces on any large scale, the new mill at Bathurst, New Brunswick, shipped to the United States in the quarter ended December, 1923, newsprint paper valued at $215,508. As the mill only commenced operations during the latter part of the year a much larger amount will in all probability be exported during 1924. It is understood that the company imported some pulp from Newfoundland mills. (Consul G. C. Woodward, Campbellton, New Brunswick, January 24.)

He—The engine seems to be missing, sweetheart.

She—That's all right, dear, it doesn't show.

Some Sulphite Mills Calculations

(Continued from page 13)

From the analysis, this is 98.5% of the final dry volume, which is therefore $\frac{261}{0.985} = 265$ cu. ft. From Fig. 3, the volume % of dry gas saturated at 68° is 97.5%; the volume of saturated gas leaving the system is therefore $\frac{265}{0.975} = 271.5$ cu. ft. per minute.

(b.) From Fig. 3 this gas carries 0.001 pound of water per cubic foot, or 0.27 pound per minute.

(c.) Partial pressure of SO_2 in gas entering system = 0.18 x 743 = 134 millimeters. From Fig. 4, the specific volume of SO_2 at 90°F, 134 millimeters pressure = 35 cu. ft. per pound. The weight of SO_2 in the gas is therefore $\frac{325}{35} = 9.3$ pounds per min.

(d.) From Fig. 2 the loss of SO_2 in the exit-gas is 7% of that entering the system.

(e.) The weight lost is 0.07 x 9.3 = 0.65 pound per minute.

The next article in this series is entitled, "Resistance to Fluid-Flow."

Conditions in Japan

As a result of the disaster offices, stores, warehouses and mills of firms dealing in "European" paper in and around Tokio were burned down. These were, however, restored within a month and able to meet the demand for "European" paper. This is the condition of the private companies, which, fortunately, suffered small damages.

One of the largest mills, however, the Government Printing Paper Bureau, suffered severely, its damages being roughly estimated at 2,000,000 dollars.

Earthquake Losses

We cannot know the exact amount of damage wrought by the earthquake, but from reliable reports we can make a rough estimate. The loss of European paper may be put roughly at 55,000,000 pounds, which amounts to 7,700,000 yen. This is rather smaller than it was generally supposed.

Although the loss was small, the settlement of fire insurance cannot be made, so the losses will be greatly felt. In fact, the paper manufacturing company and its agencies were unable to make use of checks, so there resulted a moratorium. Even for discounted checks, the banks had to postpone payments, so there was naturally great difficulty in the circulation of capital.

There was, however, between the first-class paper manufacturing concerns and their selling agencies a means arranged for the payment of checks issued, and the companies supplying merchandise to the agencies allowed a postponement of payment so that there will be a gradual restoration of credit conditions within a few years. So, although there seems to be such confusion in paper manufacturing circles at present, there is no need of being pessimistic about the future News Print Service Bulletin.

The economic problem of securing an adequate supply of paper

THE book is of special interest to everyone connected with the pulp and paper industry and equally so to all users of print paper. It points out clearly what must be done to develop sufficiently our supply of pulpwoods. It shows the steps necessary in forest conservation and discusses the subject from the practical viewpoint of industrial needs.

Pulpwood an Wood Pulp in North America

By ROYAL S. KELLOGG

Author of *Lumber and Its Uses, The Cost of Growing Timber, The Timber Supply of the United States,* etc.

270 pages, 6x9, 87 illustrations, $4.00 (*English price 20s.*) *net, postpaid*

The book describes the pulpwood industry, the processes of making paper pulp from wood, the timber supply of North America, the need for increased timber production and the future possibilities of the pulp and paper industry. Detailed statistics of production and consumption since the establishment of the industry are given in the appendix and shown in the text by means of graphic charts of unusual effectiveness. The book also carries many illustrations typical of mill operations and forest scenes.

Do You Know

That 100 million cords of pulpwood have gone into paper in the United States and 30 million cords in Canada?

That paper-making is a billion-and-a-half-dollar industry in North America?

That a permanently self-contained operation for the manufacture of 100 tons of news print paper daily may require the equivalent of an investment of $10,000,000?

That the United States and Canada produce and use as much paper as all the rest of the world combined?

That the per capita consumption of paper in the United States is 150 lb. yearly?

How much pulp may be made from a cord of wood?

How much pulpwood and wood pulp has been exported from Canada?

How much pulpwood and wood pulp has been imported into the United States?

What are the pulping properties of 70 species of American woods?

What are Forest Regions of North America?

How much and what kinds of timber there are yet left in the various regions of the United States and Canada?

How much forest land in North America is publicly owned and how much privately?

What regulations apply to timber cutting in the public forests?

What are the essentials of a forest "Working Plan"?

That forestry is the application of definite scientific principles to the growing and using of timber crops?

What it costs to grow timber?

Who is responsible for the maintenance of the timber supply of the United States and Canada?

What are the essentials of a National Forestry policy?

That without forestry there is no adequate, permanent supply of paper and other wood products in America?

That there is no sense in delaying the effort to maintain the American timber supply on the false assumption that we can turn to any other part of the world for any considerable part of the wood products essential to our well being?

LATEST MARKET REVIEW

IMPROVEMENT SOON IN THE MARKET

Monthly Market Review Says Business Will Pick Up Shortly

FORECASTS of an improvement in business early in 1924 ,as compared with the late fall and early winter months have been made good," says the monthly market review of the Paper and Pulp Industry, the monthly bulletin of the American Paper and Pulp Association to its members.

"The year was hardly begun before there was a notable influx of orders in nearly every grade, and the business increased steadily throughout January. There was then a slight falling off in new orders, the immediate needs of the consumer having been met, such increased demand is still being felt. Some grades of paper are stronger now than at any time for months.

"Even in the grades which were slowest to feel the increased demand there has been evidence of a healthy iprovement in conditions. In book, for instance, while the volume of orders has not been remarkable, the number of small orders is reported by many companies as being the largest on record, though all for immediate delivery.

Late Market Quotations

(12 M. Tuesday)

	Bid	Asked
American Writing Paper Co. pref.	2½	2¾
International Paper Co., ...	37¼	37½
Union Bag & Paper Co., ...	60	61½

"Fine papers have been in good demand, and as a rule the demand is heaviest for the better grades. Kraft wrapping has been showing renewed strength, even on the sea board where the foreign competition has been most seriously felt.

"It is perhaps significant that the increased demand is largely coming to the mills from the interior markets, rather than from the coast points where many importers have evidently been seeking every possible means of evading the customs acts by improper classification of imports.

"The general improvement will doubtless be reflected to some extent in the January production figures of the mills. The improvement, however, will probably be shown to a greater extent in the production figures for February, when many of the orders received during January were being handled in the mills."

Brown Issue Stock

Hornblower & Weeks has announced the offering of $2,000,000 per cent cumulative preferred stock ($100 par value) of the Brown Corporation, incorporated under the laws of the Province of Quebec, at a price of 98½ and accrued dividend to yield about 7.10 per cent. The stock is callable at 105 and accrued dividends, and dividends are payable quarterly in United States gold coin.

The Brown Corporation, formed in 1905, owns and operates a large modern sulphate pulp mill of 220 tons daily capacity and a lumber mill at La Tugue, Province of Quebec, Canada, representing a cash investment of more than $6,000,000.

Now In Bankruptcy

The Northeastern Paper Company of Cambridge, Mass., has been formally petitioned into bankruptcy by three creditors. The claims are small. The Metropolitan Filling Stations claim is $487.22; the Garden City Press of Newton, Mass., for $1500 and the George W. Prescott Publishing Company of Quincy, Mass., of $71.76. The company formerly occupied the Morey & Company building. It recently vacated the premises and D. DeStafano Company, Inc., is now occupying the building as a paper warehouse with Morris Driscoll as manager.

Paper and Board

New York, March 4—Business in most kinds of paper continues to develop in a consistent manner and in fair volume. The demand is still somewhat lopsided; that is, some descriptions are in good movement toward consumers whereas other classes of paper are experiencing comparatively quite market conditions. There is as yet little disposition evinced by buyers to operate on other than a very reserved scale; currnt orders are almost entirely against immediate requirements, and a percentage of consumers are managing to get along with contract commitments in such a way as to preclude any additional purchasing of importance for spot shipment.

The industry as a whole is marked by activity of a scope which can be correctly designated as better than normal, certainly much above what was regarded as normal in pre-war days. At the same time demand for some kinds of paper is not of sufficient volume to provide capacity work for all of the mills of the country. There are some groups of paper mills which are in want of orders and which are exerting such effort as they can to stimulate buying. This means of course that price concessions are being offered and granted to buyers in certain cases; consequently the price tone in some classes of paper is none too steady. Trere are other papers which are in active demand, with the call for supplies running neck and neck with the production, and with manufacturers therefore securing firm market prices without any difficulty whatsoever.

Newsprint continues to lead all other kinds of paper in point of volume of demand. Publishers are absorbing print paper in a steady way and are using supplies in heavy amounts. In fact, judging from the size of the issues New York newspapers are printing each day, newsprint consumption is holding to the high level reached during the past half year and is probably increasing slightly. Advertising in the daily press is establishing some new records, and publishers are finding it necessary to frequently omit many columns of advertisements from their issues.

Newsprint production in the United States in January showed a substantial jump over the December output, amounting to 128,772 tons, compared with 117,790 tons in the final month of 1923. Shipments from mills totaled 123,253 tons in January, against 116,826 tons in December, which means that manufacturers shipped out paper in tonnage close to their production during January. Canadian mills produced 109,875 tons of newsprint in January, against 95,726 tons in the preceding month, while mill shipments totaled 107,966 tons, contrasted with 100,624 tons in December.
